definitely informed lately as to the advantageous results of the shot fired at the Manchester van, when, as an Irish historian and member of Parliament has it, Sergeant BRETT "got in the way of the bullet"; and of the still more dramatic explosion at Clerkenwell. The brutal aimlessness of this latter proceeding has been sufficiently often pointed out, and the destruction of a train by dynamite would not be more brutal, and might well be equally aimless. Of course there is not the slightest evidence to show that, as a matter of fact, Fenianism or Irish agitation had anything to do with the matter, and it is only possible to treat the question as one of pure speculation. The professional robber and the Fenian—who may be described as a professional murderer—appear to divide the chances pretty evenly between them. In this connexion it is hardly superfluous to take the recent audacious attempt to murder at Sheffield, which is pretty certainly the work of Fenians or some similar set of scoundrels. The Irish-American rascaldom with which Ireland is now swarming, and which is abundant enough in the large towns of the North of England, is capable enough of both deeds. That the dynamite used was apparently of an unusual kind, made by amateurs and not by professional manufacturers of explosives, is a fact somewhat noteworthy, but which is capable of being explained in more ways than one. But it is, on the whole, rather in favour of the hypothesis of a political society being engaged in the matter than of its having been an ordinary criminal speculation. There is no reason why the usual dynamite of commerce should not suffice the professional robber, especially as it presents less chance of identification. On the other hand, to have their own explosives made for themselves is an instance of the kind of half-childish vanity which is so frequently united with the devilish scheming of political agitators. It would be a great pity if any scare were excited by the occurrence. A very little thought will show that such an attempt is much more likely to fail than to succeed, and very unlikely to have even a chance of succeeding. Fortunately these schemes require a good deal of delicate adjustment, and the chapter of accidents is heavily in favour of the honest men against the rogues. The usual and necessary inspection of railways where the traffic is heavy is, moreover, so frequent that in most cases obstacles of any kind on the line are discovered before they can do any harm. The confidence felt by the public in the Department of Criminal Investigation is not extraordinary, and it will not be surprising if nothing is ever found out about the matter, or about the mysterious stranger who, with a bald head and a coat over his arm, was observed contemplating nature at six o'clock on a rainy morning. But if the thing turns out to have been a delicate jog to Mr. GLADSTONE's attention on the part of the I. R. B., there is at least one person in this kingdom who will have no reason at all to be surprised. Travellers by the North-Western will probably for some time to come wish that Mr. GLADSTONE had been less explicit in his revelations to the men of Midlothian as to the motives which usually act on his mind.

DEMOCRACY IN VICTORIA.

THE colony of Victoria continues to discharge its chosen function of illustrating the character and tendencies of extreme democracy. A small and scattered community possessing abundant material resources has the advantage of trying political experiments in comparative safety. There are no complicated systems of industry to derange in Victoria, and colonies, fortunately for themselves, are exempt from foreign politics. Faction, envy, and intolerance can only check the growth of prosperity by false economic legislation, and by the exclusion of the most competent classes from the conduct of affairs. In the absence of an aristocracy which Mr. FORSTER would condemn as founded on the accident of birth, successful traders, and lawyers and doctors with good incomes, are regarded with jealous dislike; and, on more plausible grounds, owners of large tracts of land are denounced as enemies of the people. The dominant working class is bent on maintaining a monopoly of employment by discouraging immigration. Small traders and founders of inchoate manufactures seek, as in the United States, to perpetuate and increase local monopolies. The whole population is comparatively small in number, but the extent of its territory gives it a complacent belief in its own importance, and there can be no doubt that at some future time it will expand into a considerable State. The petty demagogues who govern the colony sometimes, on small provocation, threaten the Imperial Government with secession; but they find that it is difficult to excite enthusiastic interest in the process of pushing at an open door.

Judicious well-wishers of the colony have been disappointed in the plausible belief that a reaction had set in. Not many months have passed since Mr. BERRY and the extreme democratic faction were temporarily driven from office, in consequence of the indignation which even their own supporters felt at the prevalence of jobbery and faction. Mr. SERVICE, the leader of the Opposition, succeeded with a moderate majority, and proposed a reform in the constitution of the Council which seemed likely to end a troublesome controversy. Unfortunately a cross issue raised by the Roman Catholic party divided the Ministerial supporters, and Mr. SERVICE was defeated in an important division. As the Roman Catholics were not numerous enough to claim the succession, Mr. BERRY took advantage of their victory. A coalition between ultra-democrats and advocates of sectarian education seems to be neither consistent with intelligible principle nor likely to last; and at the date of the last accounts the alliance had not been consolidated by the participation of Sir JOHN O'SHANNASSY and his associates in the formation of a Ministry; but probably by this time the difficulty may have been overcome.

The characteristic antipathy of the democratic agitators to the rules and traditions which are the best security of freedom was exhibited in a vote of want of confidence proposed by Mr. BERRY before the Government had formally opened the new Parliament. The object was apparently not so much to inflict a slight on Lord NORMANBY as to prove the superiority of the victorious faction to regulations and standing orders. Mr. BERRY is once more Minister, and Mr. PEARSON, who accompanied him on his mission to England, is one of his colleagues. A few years ago Mr. PEARSON was well known as a learned resident at Oxford. In the new life which he has chosen he has already made himself conspicuous by his support of democratic, if not communistic, doctrines, and his patriotism is no longer Imperial, but colonial. It is not a little strange that a cultivated Englishman can so readily dissociate himself from the feelings and associations in which he must have grown up. Before his late visit to England Mr. PEARSON had proposed the application of colonial revenues to public works undertaken, not for the general advantage, but for the employment of the working classes. Sir BRYAN O'LOGHLEN, who, when he was Attorney-General, talked about deporting the Governor by force, has for the present preferred his devotion to the Roman Catholic cause to his sympathies with Mr. BERRY and Mr. PEARSON; but the party which is equally hostile to property and to the English connexion will not remain disunited. The suppression of the independence of the Council, and the substitution of direct universal suffrage for representative government, will be again proposed, and perhaps carried. Taxation will be unequally imposed on political rather than on fiscal grounds, and protective duties will be maintained and perhaps increased. It is not a little paradoxical that the PRINCE of WALES should have been invited to attend an Exhibition at Melbourne in the present year. It is perhaps fortunate that the Colonial Government will not have the opportunity of offering some personal affront to the Crown. The discourtesy shown to the GOVERNOR in proceeding to business before the delivery of his Message indicates the temper and taste of Mr. BERRY and his associates.

When the Australian and North American colonies hereafter become nominally as well as really independent, they will perhaps find it expedient to modify their Constitutions by the introduction of checks and balances which exist in different forms in England and in the United States. It is of course impossible in modern times to found a second legislative Assembly on Mr. FORSTER's accident of birth; but the framers of the American Constitution created a Senate with greater practical powers than the House of Lords, and they conferred on the Executive an independent capacity of action which had already become obsolete in England. The Senate has far greater influence than the House of Representatives, and the President can suspend the decisions of both. Neither Colonial Governors nor Secretaries of State exercise any

real control over the Ministries which from time to time represent local majorities. The Council of nominees which Mr. BERRY proposes to establish in Australia would be appointed, not by the Governor, who might probably select competent and independent legislators, but by the Ministers, who are the leaders of the dominant faction in the Assembly. The main object of the measure is to render permanent the accidental supremacy of the extreme democratic party. The present Council is weak because it is not elected by universal suffrage. The reformed Council would be a fiction, until it became an impediment to the action of a possible Ministry of the other party. It would then be, not without excuse, remodelled in the interests of the actual Ministry. All real authority will reside in the Assembly, until the demagogues succeed in superseding Parliamentary government by the rude device of a popular vote. Mr. BERRY's *plébiscite* is a caricature of the theories of Parliamentary duty and responsibility which have lately been promulgated in England.

It might perhaps be questioned whether freedom from external dangers and complications is an unmixed advantage to the Australian colonies. The Governments of the Cape, and, to a certain extent, the Government of New Zealand, have to provide for the common security against natives who may possibly become enemies. The Government of Victoria has no enemies to fear except wealth, respectability, and intelligence. Injustice must be perpetrated, if at all, at the expense of minorities who theoretically enjoy equal rights with their countrymen. The evils of democratic despotism would perhaps be greater if the colonists were not of English blood, and consequently of a disposition to limit the functions of legislation and government. The Americans can afford to tolerate peculation and incompetence in some of their rulers, because they for the most part govern themselves. Time will show whether the colonies possess equal power of resistance to the vicious tendencies of universal suffrage. It must be admitted that, for the present, Victoria stands alone in its love of turbulence and anarchy. Its condition furnishes no argument against the modern experiment of conceding to colonies the exclusive management of their own affairs. The provincial demagogues could not in any circumstances have been restrained by Imperial authority. If Victoria had been partially administered by the Colonial Office, the agitators would have sought popularity in sedition even more readily than in unequal legislation. They are now content to assert their undisputed independence by occasional displays of rudeness which provoke no return.

THE NINE ELMS ACCIDENT.

A BAD railway accident at Nine Elms comes home with unusual force to Londoners. They can be philosophical over possible negligence in the North, or an obstinate refusal to take obvious precautions in the Midland counties; but when a disaster happens in London itself, and to a train by the like of which they may have themselves to travel every day, their interest in the matter becomes very keen. Unfortunately, the Coroner's inquest, which is a principal means of bringing out the circumstances of an accident ending in death, threatens to degenerate into a wrangle between the Court and the lawyers employed in the case. The proceedings on Tuesday were almost wholly of this sort. The inquiry had to be adjourned in order to allow the driver of the passenger engine which ran into the goods engine to recover from his injuries sufficiently to be examined; and it was suggested by one of the solicitors that, as this man's evidence was of great importance and he himself very ill, his deposition should be taken. The solicitor maintained that the Coroner had power to order this; the Coroner maintained that he had not; and, as there was really no other business before the Court, Coroner and solicitor had a fine time of it, ending, of course, as such squabbles commonly do end, in a threat on the part of the Coroner to clear the room, and in broad hints from the other side that the Coroner did not know his business. Until the importance of the coroner's office is more fully recognized, and the mode of election to it changed, these objectionable incidents will probably be recurrent in coroners' inquests. Whichever of the two views of a coroner's powers may have been correct as a matter of law, there can be no question as to which is right as a matter of common-sense. What the solicitor asked the Coroner to do was simply to take steps to perpetuate testimony. The immediate cause of the accident must be ascertained from the evidence of three persons—the signalman who allowed the passenger train to come on, the driver of the passenger engine, and the driver of the goods engine into which the passenger engine ran. Of those three, two are seriously ill, and it is possible that they may not recover. If they die, two out of the three persons who alone can give any account of what happened will be silenced. The Coroner is of opinion that, as there is no charge before him, he cannot have the depositions of these two persons taken. If he is right in so thinking, the law upon the subject ought plainly to be altered. Very serious charges may arise out of the inquest, and it seems a mischievous technicality to say that evidence in support of a charge may be perpetuated, but that evidence on which a charge may be founded must not. It is perhaps a fortunate circumstance that one of the deaths took place in the jurisdiction of another Coroner, and the inquest in this latter case has very properly been adjourned in order to give the jury an opportunity of going on with the inquiry if they are not satisfied with the proceedings at the first inquest. Out of those two inquests and the inquiry which is being conducted by the Board of Trade there is every chance of our getting at the truth, provided that death does not remove a material witness out of the way.

As yet all that is ascertained about the accident comes from the evidence of the signalmen at the "locomotive junction-box" near Nine Elms. There are always two signalmen at this station, and on Saturday night both came on duty about ten o'clock, ALMOND, the junior one, coming first. At ten ALMOND received the signal to let a goods-engine, which was then standing on the down main line, pass into the locomotive shed, and two minutes later he let this engine pass his box and go on to the junction-points. Properly his next act would have been to signal this engine to go on into the locomotive shed; but at three minutes after ten his attention was diverted by the passing of the Portsmouth express on the up main line, and when this had gone by ALMOND appears to have forgotten all about the engine which he had left standing on the down line. Had he remembered that it was still there, there would have been abundance of time for it to pass into the locomotive shed before the train which ran into it came up. At five minutes after ten ALMOND received the warning signal that the Hampton Court train was on the down line. He reported this to the senior signalman, who had come into the box after the passing of the goods-engine, and was told to see if all was clear. ALMOND looked to see if it was so; but his attention was again called away to a train from Kingston on the up line, and to an engine which had to be crossed on to the Windsor line. All, however, did seem clear, and accordingly he signalled the Hampton Court train to come on. Two minutes after the mischief was done. Whether there was a light burning at the back of the stationary engine does not seem to be known. ALMOND says that he did not notice one as the engine passed, and the fireman on the engine is unable to say whether the tail-light was burning or not. Had it been burning, it could apparently have been seen from the signal-box on an ordinary night. But Saturday night was not an ordinary night. There was a strong wind blowing and heavy rain falling, and wind and rain together may be quite as disturbing to the eyesight as fog.

Until something more is known, it is impossible of course to come to any useful conclusion as regards the circumstances of the accident. That it would not have happened if ALMOND had remembered that he had not passed the goods-engine into the locomotive shed seems to be clear. Nor was his forgetfulness due, as was at first not unnaturally suspected, to the fatigue consequent on long hours of work. On the contrary, he had only just begun his turn of duty. It is to be observed, however, that though the signal-box at which he was stationed is rightly held to be so important as to require the constant services of two signalmen, it was at this precise moment being worked by one. ALMOND came on duty "shortly before" ten, and DAVIS when it "had just turned" ten; and it may be supposed that the men whom ALMOND and DAVIS relieved went off duty as soon as ALMOND entered the box. Had DAVIS come in at the same time as ALMOND, both the men would have known of the passing of the goods engine, and it is in the highest degree improbable that both would have forgotten that it had gone on to the junction-points and was there waiting for further orders. If it is not already

a rule of the Company that where there are two signalmen to a station the pair on duty shall not leave until both the men who are to take their places have come into the box, it is plain that it ought at once to be made so. Had this simple precaution been observed, this accident would almost certainly not have happened. With trains succeeding one another as quickly as they do on the South-Western line at Vauxhall, a signalman cannot be left to himself even for two minutes without immense occasion for mischief being possibly given. Apart from this element in the question, it ought to be ascertained whether sufficient allowance is made for the additional difficulties under which signalmen and engine-drivers do their work in such weather as that of this day week, and whether proper care is always taken to ensure that the tail-light of every engine is kept burning while it is moving about on the line. The fact that the collision was caused by a momentary forgetfulness on the part of one man does not dispose of the question. The human memory is never to be absolutely depended on. The man who is most trustworthy in this respect may fail, and the true excellence of a system of precaution against accident consists in the presence or absence of sufficient counter-checks to make good these occasional failures.

Another point to be noted in connexion with this accident is the part which may possibly have been played in it by the obstinate economizing for which Railway Companies have lately taken so much credit to themselves. Supposing it should appear that the tail-light of the goods engine had been burning, and had been seen by the driver of the passenger engine, the next question will be why the passenger engine was not stopped soon enough to prevent a collision. Except when the distance between a train and the object towards which it is travelling is very short indeed, the stopping of a train is entirely a matter of brake-power. There are brakes now in existence the application of which will bring a train to a stand in what, considering its speed and momentum, is an almost incredibly short time. The Directors of the South-Western Railway Company lately told the Board of Trade that they had not yet seen any brake which completely answered the idea they had formed of what a brake ought to be. If accidents would be considerate enough not to happen while the South-Western Directors are giving the rein to the imaginative faculty in the matter of brake-power, railway passengers might cheer themselves with the thought of the wonderfully perfect machine that the Directors might at last discover. But, as accidents go on happening without regard to the Directors' arrangements, it is expedient that some jurymast should be set up, and the public protected for the time by a brake which may not answer all the requirements that an ingenious and dilatory fancy can suggest.

THE ELEMENTARY EDUCATION ACT.

TWO Circulars which have just been issued by the Education Department instruct the Inspectors how to deal with any difficulties that may present themselves under the Elementary Education Act of the present year, or under the provision for teaching class subjects which now forms part of the Code. From the first it appears that the Education Department is at last determined to make the Act of 1876 a really working measure. The country owes the extension of compulsory attendance to the whole country to Lord SANDON; but Lord SANDON was content—perhaps wisely—with establishing it as a principle. The translation of the principle to practice he left to his successor. The Act of 1876 imposed upon the local authority of every district the duty of sending children to school. The Act of 1880 arms them with the powers necessary to discharge this duty. The Circular, while it notes "with satisfaction the increase of scholars on the "registers of aided schools," notes also that the number of scholars who attend "with even the small amount "of regularity required by the Code" falls short by one and a quarter million of what a judicious enforcement of the powers now vested in the local authorities might easily make it. The Circular further reminds these authorities that Lord SANDON's Act enables the Department to deal very decidedly with any obstinate resistance to the demands which the law makes on them. "My Lords" trust "that they may not be obliged to have recourse to "the power with which they have been entrusted of superseding any of those authorities by persons specially "appointed with the view of administering the by-laws." They would rather that the work were done by those whose business it is to do it; but, if this should prove impossible, they are prepared to hand the work over to those to whom it will be a pleasure as well as a business. The Department, however, are evidently not quite easy as to the manner in which their last new broom will work. They appear to be afraid lest local enthusiasm should occasionally get the better of local prudence, and the Department be besieged with recommendations to supersede the local authority in favour of those who are more interested in the progress of education in the district. If the Department were to listen to these applications, it would soon come to be recognized that a new and cheap way of entering public life had been opened out. Instead of encountering the cost and labour of a contested local election, the judicious reformer would allow the reactionary candidates to be returned, and would then apply to have them superseded, on the ground that they were allowing the powers with which they had so recently been armed to lie altogether unused. To meet this contingency the Circular tells the Inspectors that it rests with them and the Department, "rather than with individual parishioners," to see that the local authority of each district does its duty in enforcing the attendance of children at school. If attendance in any district is slack, it is to the Inspector that the Department will look for information as to the cause to which this slackness can be traced. "My Lords" are not, however, without fear lest even Inspectors should occasionally show a somewhat indiscreet zeal. It is conceivable that they may occasionally jump to a conclusion rather hastily, and assume without sufficient inquiry that a local authority has neglected its duty when in fact it has only discharged its duty in a somewhat obnoxious way. The Inspectors are warned that frivolous and unfounded charges of neglect of duty will only prejudice the cause which they have at heart. In order that education should become universal, it is important that the action of the Department should have the sympathy and co-operation of all who are really interested in making it universal. If their attention is drawn away from the weightier matter, how education shall be furthered, into squabbles whether A. or B. will do most to further it, this co-operation and sympathy will not be secured. The district will be divided into a faction which sides with the Inspector and a faction which sides with the local authority, and between the two the end for which Inspector and local authority alike exist will be sacrificed. This is such very sensible advice that it is to be hoped that it will be accepted by the Inspectors. An ardent and energetic young man might easily set a whole parish by the ears, though all the time he might have done nothing worse than have been a little too impatient with a well-meaning but rather stupid local authority.

The second Circular carries us into a region very much further removed from the dull routine of elementary education. It reminds Inspectors that, in order to earn the highest possible grant, each class which has in it children of any standard above the first must be examined in two class subjects, and all children above the third standard must also be examined individually in two or more specific subjects. The result of this arrangement is that the teachers of the higher classes have often "to provide eight lectures per week." The Department are to all appearance a little startled at the consequences of their own acts. At least, if it is not so, it is difficult to understand what they mean by the remark that "a graphic oral lesson requires constant "acquisition of fresh matter, rearrangement of plan, and "thoughtful preparation of illustrations or experiments, as "well as a copious choice of language and a readiness of "adaptability to difficulties that may arise in the course "of a lesson for which no preparation can be made." This enumeration of the qualifications which the Code indirectly requires in all teachers who have to do with children above the third standard is enough to take away the breath of any one who remembers what a drudgery the everyday work of elementary teaching must necessarily be. A habit of constant and intelligent study, careful preparation of lectures, a copious choice of language, and readiness to deal with unforeseen difficulties that are met with as a matter of course. They have a certain market value, and, ordinarily speaking, they cannot be

secured except by those who in one form or another are prepared to pay the price they will fetch. There are some employments in which the pleasantness of the work leads those engaged in it to take lower pay than they would put up with in less congenial occupations. This is not the case with elementary teaching. For the most part, a man will not become a teacher of such very rough babes as are found in Board and even in voluntary schools, unless he is either not fitted for higher work, or it is made worth his while to take this particular work. If the qualifications just enumerated are wanted in elementary schools, they can be attracted there just as easily as anywhere else; but the motive power must be the money which a man can make by going there. We look forward then to one of two things happening as a result of this provision in the Code. Either teachers of this quality will not be had—in which case the teaching of class subjects will sink into a worthless string of fine-sounding words, or they will be had and paid for—in which case the item of teachers' salaries will grow with great steadiness and great rapidity. It is not that teaching does not evoke enthusiasm, or that enthusiasm is peculiarly greedy of money. If the field into which the properly equipped teacher of class subjects is to be daily turned were one that repaid tillage, the experiment would be much more hopeful. But it is nothing of the kind. As we have often insisted, the work of cramming secondary instruction down the throats of children who will leave school at twelve must always be ungrateful, because it must always be useless. "Hitherto," says the Circular, "even in the upper "classes of elementary schools, the age and attainments "of the children have generally incapacitated them from "taking notes of useful length." Does Mr. MUNDELLA look forward to a time when the children attending elementary schools will be of an age to take "notes of "useful length"? The Department may of course obtain an alteration of the law which shall make attendance at school compulsory up to the age when men ordinarily leave the University; but, unless they succeed in doing this, the hard necessities of life will assert themselves at much the same age as they do now. So long as the children whom a teacher has under his charge are rarely more than twelve years old, the teaching of class subjects must be mere drudgery. The best children will be those who catch the master's phrases most accurately and reproduce them most mechanically, and to teach children such as these is not a career which a young man of more than ordinary intelligence will embrace without being well paid for condescending to it. The prospect is not a pleasing one for any one who regards moderation in expenditure as one of the marks of a good local authority.

GIANTS AND DWARFS.

FROM time immemorial no show, pageant, procession, or fair has ever been complete without the presence of a giant, a dwarf, an unknown animal, or a monster. The monster, indeed—especially the human monster—has been of late years extremely rare and difficult to procure. Formerly, when the demand was brisk, the manufacture of monsters formed a special industry; and, according to Ambroise Paré, "that famous chirurgeon," the *larrons et bélistres* of France carried on in his day a profitable trade in the transformation of wretched children into shapeless and hideous monsters. A large proportion of the subjects of the great Coesre, king of vagabonds and thieves, and most of the residents of the Cour des Miracles, were such mutilated and disfigured creatures. The art of producing withered limbs and distorted faces is now probably lost; yet the visitor to a French fair may always look to find some eccentricity, some unfortunate freak of nature, figured with bold exaggeration outside a booth, provided with a showman, a drum, and a pair of cymbals, and exhibited behind the canvas to all comers for the charge of one penny. A lively writer in a French paper some time ago described a banquet, at which he declared that he had himself assisted, where all the guests were professional monsters. Among them were the well-known dwarf with long arms, and his sister, likewise a dwarf, with no arms at all; the living skeleton; the elephant girl, with a trunk for a nose; the woman covered with fur like a bear; the bearded woman; the albino; the giantess; the man with no legs; the human porpoise, and others, all pleasing companions of the dinner table and delightful objects of study. It is certain that in the matter of monsters the French are ahead of us; for except the fat lady, and perhaps the living skeleton, we should hardly nowadays expect to find a single one of these interesting specimens of humanity in any English fair. But then our fairs themselves are degenerate, besides being few and far between. Their attractions are not what they were. Gingerbread in all its branches may yet survive; but it is sad to think that children may go from fair to fair without once setting eyes on those terrible and interesting creatures who formerly held booths of state, and filled the mind with terrible, yet delightful, dreams of Bogey which lasted for a month.

The fact of this Banquet of Monsters may be as doubtful as the valiant Gest of Brummy, but the idea is worthy of a French imagination; only it deserves extension beyond a simple dinner. There should be held a Congress of Monsters, at which might be elicited something of the habits of thought engendered by having your head between the shoulders, or by wearing two pairs of legs, or by being covered with fur. The "gate money" at such a Congress would be certainly considerable, though the "scientific results," to quote the words of a late illustrious Faster, might fall short, as his did, of reasonable expectation. We should like to know, for instance, how monsters regard the world from which they are held apart, and we would call them together with the object of this anthropological inquiry; but they might, when met together, make use of the opportunity to speculate, instead, how the ignoble and common herd, made after the mere every-day pattern, not distinguished by so much as a hump, look upon things. This would be disappointing. Or perhaps they might refuse to read any papers at all; they might prove indifferent as regards scientific research; they might be slow at catching the idea of the thing; they might be perverse; they might even be unable to wield the ready pen. Such an assemblage would, however, apart from scientific considerations, attract all sorts and conditions of men. Some of us would hasten to see it under the pretence of holding up the exhibition to public contempt in the papers; some in order to be able to warn off others; some professing an intention of preaching upon it; some under solemn protest; a few with a brazen ostentation of curiosity; but all would find their way there, and the "gate money," as we have said, would be very considerable.

The manager of a London show has partly anticipated these suggestions—he may, indeed, be contemplating a Universal Congress of Monsters—in an interesting collection now open to the public in his establishment. A long narrow room furnished with a piano, a platform, a table, and a few chairs, contains the whole exhibition, which consists of a giant, three dwarfs, a Hindoo, a young lady to play the piano, and another to sell certain perfectly useless articles displayed upon the table. What they all do when there are no visitors in the room it is impossible even to guess. On entering, a certain movement is perceptible as of a general awakening; the young lady at the piano runs her fingers carelessly over the keys; the young lady at the stall is discovered busy among her boxes; and while you are beginning to look about a great figure of a man solemnly stalks up to you and holds out his hand to be shaken. He is between seven and eight feet high; this, according to Josephus, who here differs from the leading authority, was about the height of Goliath—"four cubits and a span in tallness"—which may be roughly estimated at seven feet six inches, unless one takes a meaner view of the cubit. It is interesting to shake hands with a man as big as Goliath. He of Gath, no doubt, had as large a hand. Upon one finger of the modern Goliath there is a ring of gold, which the giant takes off and shows, so that all who see may be abashed in considering the miserably meagre girth of their own forefingers. He is dressed in a long blue dressing-gown; which is a mistake—such a man should rise to the dignity of his eight feet in richer and more splendid garments; a George the First costume, for instance, with a flowered silk waistcoat down to the knees, silk stockings, diamond buckles, a coat with full and ample skirts, and a full-flowing Ramillies wig, would be more becoming. But he is not a giant who cares to magnify his office; he is not, apparently, proud of his superiority; he even shows clearly that he is bored with the perpetual shaking of hands and taking off of that great ring; some day the ring may lead to fatal consequences, as the boots brought the Frenchman, who grew tired of taking them off, to an early end. He sits melancholy, thinking perhaps of other Norwegians—he is of Norway—happier than himself, though perhaps nearly as tall, who roam at ease upon their native hills. For him no more feats upon the fiord; he will go on for ever shaking hands and pulling off that gold ring. When the exhibition closes for the day, where, one asks, does he go? Where does he spend his evenings? May he take his walks abroad? Where, indeed, do they all live, the folk of caravans and shows; and what are their domestic habits? We cannot, however, ask the melancholy giant, for other people have come in, and he is once more taking off the great gold ring.

We are next invited to shake hands by a neat abridgment of man, jet black of hue. He is something under three feet in height, and has a pleasant cheerful countenance. His name appears to have been chosen for him after he went into the pigmy line, and has been chosen badly; at least one would think that a better name could be found than Midget Adonis. He is about five-and-twenty years of age and is perfectly proportioned, save for a rotundity common rather among aldermen than dwarfs. He is prettily behaved and well dressed; and, when he has told you that he hails from the Transvaal, he seems to have got through all he has to say. One would like to have his opinion on the public feeling in that colony as regards annexation, but the question may be a delicate one; we are presently assured that he "went through" the late war, in which he is said to have performed signal services—services undefined, but supposed to be such as to require agents difficult to be seen except through a microscope; and our informant does not tell us on which side he fought. Now, he is coal black, and perhaps . . . but it is as well not to pursue the subject. Adonis is followed by a lady dwarf, of whom we need only say that she does

not offer to shake hands at all, but has things to sell. She should rather be described as an undersized lady than a dwarf. The next member of the happy family who presents himself is a Hindoo. He is neither dwarf nor giant, but a properly proportioned and handsome fellow, who is probably admitted for artistic effect and with a view to contrast—an Indian dress always showing well beside anything, even the Norwegian's blue dressing-gown. One of our party addresses him in his native language; this pleases him, and he rewards us with the exhibition of two or three feats in sleight-of-hand, certainly not new, but of the kind which produce the pleasure of surprise and wonder. It must be sad indeed to know how tricks are done.

Last of all, the principal personage of the show introduces himself. He is a little Chinaman, about the same height as the Transvaal veteran, but of better figure. He has delicate little hands covered with rings; he is dressed in what is, without doubt, the correct costume of a Chinese gentleman; he knows the nice conduct of a fan; he wears a hat of recognized Celestial build, with a "little round button at top"; and his face contains all that has ever been imagined possible even in a Chinese face. We have often marvelled at the depths of wisdom which lie in all Chinese eyes, and the superiority indicated by all Chinese eyebrows; but this dwarf is the ideal Chinaman; his face shows that he is serenely satisfied with himself; that he is assured of his position; that he is a philosopher, content to enjoy; that he reads little but thinks much; that he secretly contemns the restless Westerns; that he regards us, as the gleam and twinkle of his eye denote, with amusement. He is fond of talking, too, and after the usual preliminaries (in which he states, for our amusement, not in any hope of being believed, that he is a gentleman travelling in order to see the world, not to make money) he shows himself a most genial, amusing, and pleasant little fellow. One thing we presently remark. He takes no notice whatever of his companions, nor do they take notice of him or of each other; they move about as if each was alone in the room. This gives a dreamy unreality to the exhibition; one feels as if one was inside the bars of the Happy Family cage. The giant pretends to be too big to see the dwarfs; the dwarfs look straight through the giant, as if he was not there; the Hindoo glides about, just taking care not to step upon the smaller inmates, but bestowing no more notice upon them. And then one becomes aware, without being told, that the Chinaman is the chief. The rest are afraid of him. What, indeed, has a simple Norwegian, or a rustic from the Transvaal, in common with a gentleman from Ningpo, versed in the Confucian philosophy?

It is a large question, but one cannot refrain from asking whether it is better to be a giant or a dwarf. A giant, it is true, cannot be neglected, passed by, or looked over; his bigness commands respect. On the other hand, no giants have ever distinguished themselves in anything; they are disposed to be indolent; lubberliness is a failing common to giants; they are never crafty, quick-witted, or clever. Then there are so many things which a giant cannot do. He cannot dig, ride, or drive, or play cricket, racquets, billiards, tennis, or football, because the instruments used are so absurdly small; if he reads, he ought to have a royal quarto at least; he cannot go to church, unless he is allowed to sit in the pulpit, because there is no place for his long legs; he can find no comfort anywhere, unless things are made specially for him; and think of the expense of getting everything made for you twice the usual size! And one feels—but this may be prejudice—that, if a giant were to take to poetry, the flowers of his fancy would run to hollyhocks, sunflowers, or even summer cabbages. In all these things, how much better off is a dwarf! He may suffer at first from ridicule, but this gives place to admiration as the years roll on and still he does not grow; it is so easy and so cheap to make little things for him that he can do anything; and in history he has been the pet and pride of queens and great ladies.

There is a movement; a rush of half-a-dozen visitors; the entrance of a brisk gentleman in black, who has evidently got a thing to say. He steps upon the platform and says it with professional cheerfulness and official volubility. The Norwegian sadly rises, bows, and turns the gold ring; then he sits down again; the African nods, smiles, and practises the steps of a double shuffle, in which he is as yet far from perfect. The lecturer fires off two or three weak-jointed jokelets, and the Chinaman is good enough to sing a love song in his own tongue; he calls it so, but from the expression of his eye it is clear that he is taking advantage of the lecturer's ignorance, and calling him names in Chinese. The Hindoo then says that he will show us a few tricks. We get up to go. As we reach the door, we hear a familiar voice. It is 'Arry, with two ladies. He is speaking to the Chinaman, who has withdrawn to a table, where he is amusing himself with balancing pieces of stick. "Now then," cries our friend, "why don't yer show yerself?" He comes forth, obedient and smiling. But in his eyes we read behind the smile the words, "Would that I had you, gentle Londoner, in Ningpo!" Outside the show, it is agreed that, whether it is better to be a giant or a dwarf, it is at any rate worse to be a showman's lecturer.

KEEPING THE BALL ROLLING.

IT might have been thought that during the last year or two the country had had enough of agitation. With the best of Governments in power, with an obedient majority in Parliament, with Ministers individually determined to please their loyal supporters or die for it, and, above all, with the certainty under such a Government of good trade, good harvests, no foreign troubles, and the other blessings which Providence vouchsafes to deserving Administrations, political disturbers might seem likely for a time to cease from troubling. But any one who should have thought this would have shown himself sadly ignorant of the generous earnestness which distinguishes—sometimes unpleasantly, as Lord Granville lately found—the true Radical. His motto is always "Forward," and he regards not the things that are behind. The conquest of the churchyards does but stir him up to a campaign against the churches; the victory over hares and rabbits to a crusade against pheasants, grouse, deer, and "other winged game." Still more does the failure of the attempt to rob the landlords of Ireland cheer him on to an endeavour to rob the landlords of England. He cannot live—the phrase is frequently true in a very literal sense—except in and by agitation, and agitation accordingly is his theme all the day and all the year. Already, though Parliament has barely risen some ten days, many inspiriting trumpets have been blown. There is the Secretary of some Manchester Society who writes to the papers of his party complaining that between 1868 and 1874 the Tories published pamphlets containing "shamefaced and insolent" statements. Perhaps this gentleman, not being equipped with a dictionary, has made a little confusion between shamefaced and shameless; but his meaning is clear, and that is the chief point. He is anxious that his friends should state their views shamefacedly and insolently in their turn, for fear of accidents. Then we have Mr. T. P. O'Connor lecturing on the House of Lords, and Mr. Bradlaugh lecturing on the reform of the Land Laws. The great Sunday demonstration in Hyde Park against the Upper House is not understood to have been a very striking success; but then it is a first principle of modern Radicalism that the Londoner is a benighted being. And indeed the greatest proposal of all comes from no Londoner, nor from any part of London. Mr. George Fordham, of Royston, is anxious for a Reform League, and gives his reasons for wishing the formation of that particular nuisance. Indeed the impression that it is necessary to bestir oneself very much does not seem to be limited to professional agitators or to anonymous or insignificant crotcheteers. Not much, indeed, has been heard of the great National Vigilance Committee which was to be formed for the packing of the House of Commons and the abolition of the House of Lords. But voices, steady and respectable enough generally, have been lifted up against the unfortunate members of the Cabinet for taking a holiday. They ought, it would seem, to hold Cabinet Councils every day—what about we really do not know. The general impression intended to be created is that Radicalism is very earnest. There are in the future to be none of your lazy deferences to aristocratic cravings for amusement. Sessions are not to end for grouse-shooting, or partridge-shooting, or any such frivolous reasons. There is a great deal to be done, and it is to be done with the most tremendous activity and speed.

A student in another planet, who knew nothing of England and took his ideas of our social and political condition from the statements of these active gentlemen, would have a very odd and a singularly inaccurate notion of the state of this country. He would imagine that we were in pretty nearly the same plight as that in which the extremest partisans of the French Revolution represent France to have been before that event. The lower classes tyrannized over by the upper, a wealthy and bloated clergy oppressing and robbing the poor, workmen forced by law to work for impossible wages, personal liberty curtailed, odious disabilities enforced—all these things would float before his eyes as characteristics of what Mr. Carlyle used to call the Condition-of-England Question. It would be really curious to hear the opinions of such a person after six months' or a year's actual investigation of the country. This opinion might probably be formulated in language more forcible than polite; such, for instance, as "You fools, don't you know when to leave well alone?" This impolite question, of course, would not be addressed to Mr. O'Connor, or to Mr. Bradlaugh, or to the gentleman who thinks "shamefaced" a good word to run in a curricle with "insolent." They know very well what they are about and what they want. It is not to be supposed, for instance, that Mr. O'Connor did not know quite well what he was doing when he addressed to the people of Southwark an argument eminently suited to the capacities of those who call themselves the people. One-sixth of the House before which he made his motion about the House of Lords, says Mr. O'Connor, voted for him. Argal, as the number of the whole House exceeds six hundred, if the whole House had been present over a hundred would have voted for him. Afterwards Mr. O'Connor cheerfully destroyed the value of this argument by remarking that, after all, the present Parliament does not represent England. A man who talks random nonsense of this kind is only formidable because he is evidently bent on agitation for agitation's sake. To do the member for Northampton justice, his method of agitating is different from this. The bait which Mr. Bradlaugh holds out to tempt his hearers to so-called Land Reform is "the compulsory cultivation of all cultivatable lands not hitherto cultivated." That is to say, Mr. Bradlaugh would have the State assume possession—it is fair to say that he would give compensation on something like Mr. Parnell's system—of all parks, forests, moors, &c., assigning them to actual tenant cultivators. The apparent moderation of this is another instance of the ways of the professional agitator. But it is a still more curious illustration of the un-English character of the agitation itself. It has lately become the fashion to laugh at the word un-English. But it may be humbly sug-

gested to the superior persons who laugh, that when a certain set of conditions have worked fairly well for some centuries, it is not altogether unreasonable to attach an unfavourable connotation to the word which expresses the destruction and reversal of those conditions. Mr. Bradlaugh's ideal of an England robbed of all that makes its present beauty is not æsthetically tempting; his ideal of an England occupied by small proprietors perpetually on the brink of starvation, owing to competition, dubious weather, and the want of capitalist landlords ready, as at present, to give a helping hand or to bear the brunt of the loss, is economically less tempting still. As for Mr. George Fordham and his Reform League, of the objects of which he gives a long list, it would be rather interesting to find a defender of the programme and pin him down to show the practical good which, even on his own showing, would arise from the adoption of its various items. The worst of it is that this is exactly what is never likely to be done. The skill which has induced a majority of Englishmen to vote for representatives who in their turn vote as if Nonconformists had grievances will do anything. The only thing to do is, of course, to meet controlment with controlment, and to organize and register stoutly against these thickcoming delusions.

It is agreeable to turn from the dreary platitudes of English agitators to the fine racy stuff which is being turned out on Irish platforms. Here, unfortunately, as in England, native products are being hardly pressed by American competition. Despite the efforts of a thousand spouters, with Mr. Dillon at their head—we beg Mr. Sullivan's pardon, with "John" Dillon at their head—a single American has come in an easy winner. Mr. Redpath is an American journalist, and is sometimes described as the Correspondent of an American journal. It is only to be regretted that the organ of light and sweetness which has the advantage of Mr. Redpath's contributions is not known. Nor indeed can there be said to be much known about Mr. Redpath at all. There have been in effete Britain distinguished persons who bore that name, but the climes which they finally sought were, if we remember rightly, Antipodean rather than Transatlantic. It seems, however, that Mr. Redpath, who emerged upon the horizon, as far as most people are concerned, at the beginning of this week, has been talking in Ireland for a considerable time. He has been proving—rather a stale occupation for a man of Mr. Redpath's powers—that Irish landlordism represents "the foulest confiscation," and that every lawyer in Christendom, it seems, knows Mr. Redpath's law to be good law. It seems also that Lord Oranmore, more naturally than wisely, did Mr. Redpath the wholly unmerited honour of mentioning him in the House of Lords. This has greatly grieved Mr. Redpath. He does not "like to be lectured by an inferior, and every king, queen, and lord in Europe is the inferior of every Republican on this earth." The reason of Mr. Redpath's indignation at Irish affairs, it seems, is purely chivalrous. He cannot bear to see "a race of noble women" ill dressed, instead of being dressed warmly and in good attire all the time, and in purple and fine linen on Sundays." "Queens," says Mr. Redpath, with perhaps an insufficient knowledge of the habits and history of the lower animals, "have had these trappings long enough." Then, after some further observations as to the meanness of the Irish aristocracy and the nobility of the Irish poor, which were of course cheered to the echo, Mr. Redpath diverged into a plan of campaign against England. He has had, it seems, some military experience —is, indeed, probably a colonel in his own land—and, with rather surprising common sense, he told his hearers that their chances against England were in the field of battle decidedly small. He accordingly counselled patience and a preliminary gripping of the land. The result of these utterances was what can be best described as a corn-stealing picnic. We cannot see that there is any reason to threaten Mr. Redpath, as injudicious persons have done, with the fate of some previous Republicans who neglected Lord Oranmore's excellent advice and did not mind their own business. Mr. Redpath is in our opinion a most useful man, and one to be cordially welcomed. Now that not a few people in England are delicately playing with Republicanism, pointing out what a nice thing it is, how it hardly needs distinguishing from limited monarchy, and so forth, it is very good to have a real genuine Republican fruit exhibited whereby all men may know the nature of the tree. Mr. Redpath's exquisite politeness, his modest comparative appreciation of himself and others, his accurate knowledge of history, political economy, the philosophy of government, the principles of distributive justice, and other sciences, speculative and practical, strike us as really refreshing examples of voluntary Helotism. The Helot Republic has kindly made us a present of an awful example, without any necessity for intoxicating him or in any other way incurring moral guilt. Indeed we should not be surprised if some very long-headed Republican were to accuse the accursed aristocrats of having bribed Mr. Redpath to make his display. Certainly it comes very pat and useful at the moment. Mr. Bradlaugh's notion of an England with all the woods stubbed up and all the fells and heaths changed into the holdings of half-starved crofters, the doctrines of M. de Freycinet's adversaries in France as to toleration and the rights of persons, and Mr. Redpath's general American views of private manners and public ethics, compose a panorama of contemporary Republicanism which is in the highest degree instructive. If this is what all our agitations tend to (and it will be hard to show that it is not), there must be common sense enough left in England to remember a certain proverb in a partially obsolete work concerning old wine and new.

HYÈRES.

THE numerous visitors who now run every autumn along the beautiful line of railway between Marseilles and Nice leave on their right, soon after passing Toulon, a short branch which leads through an almost tropical valley to the half-forgotten little winter station of Hyères. A quarter of a century ago, when Nice still lay beyond the Italian border, and Cannes consisted, as its name imports, of a mere fishing village among the cane-brakes which lined the bays of the Esterel, Hyères had already won favourable notice as a temporary home for Northern invalids. But fortune has been more propitious to the easterly towns. Lord Brougham's villa set the example at Cannes; the French annexation has turned Nice into a little Brussels on the Mediterranean shore; M. Leblanc has transformed Monaco into the gambling capital of Europe; and the tide of invalids has made Mentone and San Remo familiar to our ears as fashionable resorts. Meanwhile, Hyères, the eldest aspirant amongst them all, has fallen into comparative oblivion, from which it is only slowly recovering under the impetus of its branch railway and its somewhat spasmodic efforts to regain its lost position. Yet the City of Orange Groves, as its inhabitants poetically term it, is not without many strong attractions of its own. Perched high on the side of a craggy schistose hill, in a latitude south of Florence, it overlooks at a distance of three miles the roadstead and islands by which it is best known to the outer world; while its landward view embraces at once the wooded heights of the Maurettes, the Oriental vegetation of the plain, and the bare limestone peaks of the great range which encircles the Toulon valley. Probably the almost universal belief that Hyères is built on one of its own islands forms the main reason why it is so comparatively seldom visited by the crowd of winter tourists who yearly hurry past it towards the gayer cities of the Riviera.

Between the dark porphyry block of the Esterel and the white ridges that gird round Marseilles, a mass of broken slaty hills, the Montagnes des Maures, cuts off the valley of the Argens from the sea. Tossed about by the upheaving energy into the wildest confusion, the Maures form at present a series of indistinguishable peaks and spurs, the furthest southerly outliers of the Maritime Alps. Their sides are thickly covered with an evergreen coat of pines and cork-oaks, while at the very summit a crest of denuded rock generally rises like a dome in the centre of every separate little system. The Maurettes, upon whose flanks the town of Hyères is planted, form the south-westernmost of these minor divisions. Both names recall the period, as late as the eleventh century, when the Moorish pirates had a fixed settlement on the Provençal coast, while many of the natural features in the neighbourhood still retain their strange Arabic titles. Amid so much exotic vegetation, however, the Oriental names hardly surprise the ear. Between the Maurettes and the bay a singularly level alluvial flat fills up the valley, which must in tertiary times have formed an arm of the sea, penetrating inland to the very foot of the Pharon and the Coudon, those huge piles of naked rock which block up the view to the westward. Enclosed between the Maurettes on the north and the rounded ridge of the Montagne des Oiseaux to the south, the Hyères valley gradually silted up with the detritus of the encircling ranges, and formed that rich soil which now supplies the markets of Marseilles and Paris with an almost incredible amount of early fruits and vegetables. Palæolithic implements occur in considerable numbers among the drift.

The plain so composed is sufficiently sheltered from the north by the Maurettes to permit the existence of a subtropical flora. The common clipped date-palm of the Riviera grows abundantly along the little boulevards of the town, and a few taller and more Egyptian-looking stems diversify the aspect of the endless garden plots. The prickly pear spreads over the rocky terraces in true Mexican profusion; while the great American aloe threatens to become a positive nuisance by its rapid spread among the dry hill-sides, which may well remind it of its native Jamaican home. Indeed, under the clear blue sky of Provence, the general effect of the landscape at Hyères is, if anything, a trifle too realistically tropical. The little white *bastides*, however, scattered up and down the valley in thick profusion, recall rather the Ionian coast; and George Sand describes some of the pretty neighbouring cliff paths as "a promenade on the shores of Greece." The orange-trees which once grew in all the surrounding fields encouraged the fanciful spirit of the Renaissance to identify the Iles d'Hyères with the Gardens of the Hesperides; a harmless delusion which the modern inhabitants have studiously fostered, though the islands are in reality mere barren rocks, picturesque objects in the view from the town, but quite incapable of producing the golden apples of the legend. Even in the sheltered plain of the mainland oranges are now no longer grown as a commercial crop, the competition of Algeria and the Azores having proved too much for the native producer. Only a few stray trees recall the memory of the imaginary Fortunate Islands. But it is seldom that the mistral, that masterful wind—its name is simply the clipped Provençal form of *magistral*—can find its way round the sheltering barrier of the Maurettes.

Of course a spot so specially favoured by climate has always formed a natural centre of human life. Setting aside the relics of the Stone age, the Château of Léoubes stands upon the site of Olbia, a Greek colony perhaps as old as the Phocæan Massalia. A similar colony seems to have held the castle hill of Hyères itself, one of those naturally commanding eminences which appear as

though specially designed for the protection of the rich lowlands at their feet. Coins of Helleno-Celtic date have indeed been found among the foundations of the modern town. The Roman ruins of Pomponiana, situated on the sea-shore some three miles off amid the gardens which still bear the suggestive title of the Quartier des Horts, possess only a purely antiquarian interest. They belong to the class which attract excavators and scholars rather than tourists. The sea-beaten remains of a bathing-establishment and harbour, with the bare foundations of a forum and a few villas, cannot of course compare with the magnificent structures still standing entire at Arles and Nimes, or even with the amphitheatre and aqueduct at the neighbouring little port of Fréjus. But the most casual searcher can easily find numerous fragments of figured pottery, while more careful quest is rewarded by the discovery of unbroken lamps, and regular researches have resulted in unearthing fine *amphoræ* and numerous coins. Mediæval Hyères still answers for itself *in propriâ personâ*. The old town covers the southern side of the castle hill, surrounded to the present day by rough masonry walls of the eleventh century, with a few dismantled towers and machicolated bastions running up the slope towards the summit. Only a relic or two of the ancient buildings crown the bold mass of lichen-covered rock; but the site itself is interesting, and the view from the crest stretches over the whole plain and roadstead as far as the Bay of Toulon. Small narrow streets run down the hill from the castle in every direction, as badly drained—or, rather, as wholly undrained—as those of most other Provençal towns. There are few architectural attractions; the two churches are poor and mean-looking, the best of them having but a plain and heavy exterior, with three very much restored Romanesque portals, and an interior which is too dark to be seen, or tawdry in the one chapel where sufficient light is admitted for distinct vision. To say the truth, the lovely Ligurian and Provençal coast between Genoa and Marseilles is little remarkable for the beauty of its architecture. The perpetual terror of the Barbary pirates, which never wholly died out till the present century, seems to have prevented the people from bestowing much time or pains upon ecclesiastical art. The villages nestle for the most part under shelter of castles perched on high peaks, and built wholly with a view to the protection of the agricultural champaign; and the most sacred shrines consist of mere plastered pilgrimage chapels, hanging on the summit of almost inaccessible rocks, and approached by tracks lined with neglected little white-washed oratories, vacant of the images which once adorned them. The beauty of the surrounding hill country, of the clear Mediterranean skies, and of the sea with its range of rocky islands, must make up to the lover of the picturesque for the want of Norman churches or Angevin châteaux.

Modern Hyères lies below its mediæval but still surviving predecessor, like a large faubourg, consisting mainly of a single long street which runs from end to end of the town, just without the ancient gates. It is composed of one mass of hotels and pensions for the use of winter visitors, opened, for the most part, only during the winter season. The old town and the new have little in common, save the solitary fact of their accidental juxtaposition. But even the English quarter—for modern Hyères is all but exclusively an English colony—has few gaieties or amusements of the sort familiar at Nice and Cannes. It is emphatically the invalid's resort; and most of the visitors have come because they are really in delicate health, not because they wish to idle away the colder months of the year in pleasant Mediterranean quarters with a club, a casino, and an occasional dance. As a consequence, living at Hyères is decidedly cheaper than in the more fashionable towns on the Riviera. People who require the perpetual stimulus of external excitement to keep them from mental stagnation call it dull; but those who can find sufficient entertainment in beautiful and ever-varying walks, charming drives, and all but uninterrupted sunshine, will not complain of wanting occupation. For genuine invalids the quiet of Hyères is doubtless preferable to the noisy and obtrusive gaiety of Nice or the dangerous proximity of Monte Carlo. The country around is delightful in its extraordinary variety. Immediately behind the town stretches the wooded range of the Maurettes, a tumbled mass of rock, with bold crags rising above the surface on every prominent point, and thick cork-groves covering the winding sides or shady valleys. Innumerable paths thread in and out in all directions among the brushwood, none of which apparently lead to any definite point, or serve any definite function save that of affording fresh views to the tourist. The lower slopes are covered with the sombre and silvery foliage of the olive, here a mere stunted bush, whose gnarled trunks never attain the magnificent dimensions of their Athenian and Italian congeners. The plain at their feet cannot be called picturesque; but it possesses a certain interest of its own in detail, from its Southern vegetation and its carefully tilled garden-plots of strawberries and artichokes, stretching over many miles in every direction. Beyond this curious fragment of Asia Minor, strayed into the coasts of France, a second range of red sandstone hills contrasts finely in its rounded contour with the jagged slaty tops of the Maurettes. On its seaward shoulder stands a hermitage of Our Lady, a picturesque object as seen from the modern town, with a brand-new Romanesque tower surmounting the massive pillars and simple round arches of the early building. This is one of those little hill-chapels, so common in Provence, whose sanctity probably dates back, like that of the Mont Ste. Victoire which commemorates Marius's victory at Aix, to a period long preceding the introduction of Christianity. At the mouth of the valley lies the roadstead, bounded to the west by the peninsula of Giens, which is in reality a former island of the little archipelago now linked to the mainland by two curious arched belts of shingle, not unlike the Chesil Bank which bridges over the Fleet from the Isle of Portland to our own Dorsetshire coast. Between the two banks lies a large sea pond, partly laid out into wyches for the manufacture of bay salt, and connected with the main body of the roadstead by a small Roman canal. Six or seven miles in the offing, the three islands of Porquerolles, Porteros, and the Ile du Levant, rise up as lines of bold, blue hills—the Stœchades of the Greek geographers, which have not yet lost their etymological trick of shifting their relative positions with every fresh point of view. The whole picture is completed by the range of pine-clad heights to the east and the open sea toward Corsica, where the Toulon squadron may often be seen performing its evolutions under shelter of the surrounding mountains. The extensive panorama from the summit of the castle hill embraces all these varied objects at a single glance. From the neighbouring peak of Fenouillet the eye ranges still further, to the riven gorge of Ollioules and the snow-clad Alpine crests of the Col de Tende.

BACHELOR HOUSEHOLDERS.

MUCH has been said and written about the miseries of those unfortunate persons who are compelled to put up with the accommodation offered by apartments for single gentlemen. The discomfort of the rooms, the greasy cooking, the slovenly servants, and, above all, the predatory tendencies of the landlady, have been feelingly described, and various remedies more or less practicable have been from time to time suggested. But it is to be feared that such inconveniences are inseparable from the bachelor state, for no good seems to come of all the suggestions made for their mitigation. From one point of view, it is well that this should be so. If bachelors could add to the blessings of their condition the one which they seldom enjoy, of being really comfortable at home, the complaints so often heard of the reluctance of young men to marry would be still more common. Perhaps the most satisfactory device which has yet been hit upon for dispensing with landladies is for three or four men of somewhat similar tastes and occupations to take a house and live together. It is possible to be moderately comfortable in such circumstances, but something always happens sooner or later to break up a society thus formed. We remember a case which occurred in a large provincial town, where the experiment was tried by some of the younger masters in the local grammar school. All went well for a time. Gradually rumours were spread abroad, perhaps by vindictive lodging-house keepers, that the conduct of these reprobate young men was by no means what it should be. They possessed latch-keys, and sometimes went home late at night. They habitually played whist in the evening. At last society was scandalized by hearing strains of secular music proceeding from the "monastery" windows on a wet Sunday afternoon. The "monks," as they were generally called, fell into evil repute. As gaps were made in their ranks, new comers were discouraged from joining them. Finally the society was broken up and the cause of respectability triumphed. A more successful attempt of the kind was made in London. In this case there was nothing to be feared from the opinions of society, which concerns itself little with the manner in which bachelors live at home, provided that they make themselves tolerably agreeable abroad. The various household functions were carefully distributed. A Cambridge Wrangler took charge of the financial department. A standing Committee was appointed to deal with the cook, and another to take cognizance of any dereliction of duty on the part of the housemaid in the matter of dust and cobwebs. Fortunately one or two of the men were methodical persons, who rather liked the work of housekeeping than otherwise, and the want of a mistress in the establishment was scarcely felt. But a matrimonial example was too soon set and followed, the survivors could not agree in the choice of new members, and so they parted. As bachelorhood is with many men only a transitory state, it is impossible to hope that any society thus constituted can be permanent; and persistent gynothropes, as Captain Mayne Reid, in one of his novels, calls women-haters, must regard such an arrangement as nothing more than a bright episode in the dreary succession of comfortless lodging-houses.

The most dangerous error into which a desperate man can fall is to suppose that he may remedy the evils attendant on his condition by boldly abandoning lodgings altogether and setting up as a householder on his own account. The experiment is a tempting one. To be absolute master of one's own establishment, and to order all things according to one's own pleasure, are strong inducements, and nothing but actual experience can teach the difference between theory and practice in these as in other points. The enterprising bachelor becomes at once an object of the liveliest interest to his friends. Offers of advice and assistance come in from every side. One lady offers to engage his servants for him, another is anxious to superintend the decoration of the house, a third will go about with him to choose furniture. Here his troubles begin. His friends, probably, have longings after high art, belong perhaps to different schools, while his main desire is comfort; and he will need considerable tact to enable him to have any voice at all in the settlement of his own domestic arrangements. Meanwhile, tickets of membership of every Co-operative

Society in London are presented to him, and he is inundated with the names and addresses of honest tradesmen, sober charwomen, and deserving objects of charity.

It is needless to mention the many troubles which beset the unhappy man as soon as he is fairly established. Rates, taxes, drains, plumbers, and mendicants are the common lot of householders of all sorts and conditions, and they cannot be said to weigh more heavily upon bachelors than upon married men. His worst foes are they of his own household. It is a painful experience to have a cook who will do nothing without special orders. No length of time teaches her what her employer likes and what he does not like for dinner. Each morning as he is finishing his breakfast comes the dreaded tap at the door. The cook appears, makes a comprehensive survey of the room, as though she expected to find an entire change in its furniture and general aspect since she last entered it, and opens the conversation. Starting from the state of the weather, she proceeds to remark upon the effects of drought on the production of cauliflowers, or gives a masterly sketch of the fluctuations of the potato market consequent upon the excessive rains. Thence she passes on to the question of the day's dinner. It is useless to tell her to get anything that happens to be in season. It is not thus that she has learned her duty to her employer. She has come for dinner to be ordered, and ordered it eventually is, though probably she, after all, has most to do with it. It is hard to say whether town or country servants give more trouble. Perhaps the most unpleasant, though most virtuous, specimen of her class is the elderly woman who is always recommended by the rector of a country parish to take charge of a bachelor's establishment. She is generally deficient in the matter of teeth, excessive in the use of aspirates, and her chief qualifications are said to be that she is clean, honest, and economical. It would seem as though these three virtues had been impressed upon her from her youth up as the most desirable to be cultivated. There is an elaborate assertion of candour in her slightest utterance which at once impresses the listener; and, no sooner is she installed in a new post, than she begins to make a great display of her three cardinal virtues for the edification of her employer. He, good easy man, would rather associate the idea of cleanliness with some definite effect upon the appearance of his rooms than with the continual sight and smell of soapsuds; but he is unwilling to check the praiseworthy exertions of his servant. He has ignorantly supposed that economy and honesty have their visible outcome in a reduction of his weekly expenses; but, so far as he can see, they are chiefly represented by the reappearance at table day after day of uneatable scraps, and dregs undrinkable. The rigid economy which refuses to throw away such unsavoury relics is further illustrated by reluctance to accept as soiled any linen which may be left about the bedroom. Cast-off shirts are carefully folded up and replaced in a drawer, to be taken out, perhaps, some evening when their owner is dressing in a hurry by the scanty light of a single candle. The "handy girl" whom such a woman regards as her proper colleague, or rather subordinate, is chiefly noteworthy from her extreme nervousness, and the stertorous nature of her breathing when she is in her master's presence. She seldom appears, however, being duly kept in the background by her superior officer. When there is no special work for her to do, she is generally set to "clean up"—either the kitchen-floor or her own person. Her face is usually covered with a glaze of yellow soap, and always bears traces of recent friction. When she has been a short time in her place, and begins to be of some real use in the house, she probably rebels against the iron rule of the cook. That functionary announces that she is beginning to "give herself airs," and she is replaced by a girl of more tender years and more utter helplessness. In town, of course, the two maid-servants who generally constitute a bachelor's household are pretty much on an equality, and their respective functions are more clearly defined than in the country. But it may be doubted whether things go the more smoothly on that account. If the servants are town-bred, they are sure to have a quantity of relations in the neighbourhood, and the warmth of their family affection is something beyond all previous experience. They are in favour of employing the local tradesmen, and are eloquent on the bad quality of provisions which come from the Stores. If the householder fondly fancies that he can escape these evils by engaging servants from the country, he soon finds out his mistake. They cannot go on an errand without missing their way, or being delayed at crossings, and are constantly having their pockets picked while lost in contemplation of the Albert Memorial or other triumphs of modern art.

But neither the awkwardness of the one class nor the doubtful honesty of the other is the thing to be most feared. From various indications it begins to appear that the relations between the two domestics are somewhat strained. The housemaid never mentions the cook without mysterious tossings of the head and a ceremonious emphasis on her name. The cook, when she comes for orders, lets fall casual remarks on the flightiness of housemaids at large. Voices from below are heard pitched in a higher key than usual, until some day there are sounds as of a scuffle in the hall, and one or other of the servants rushes abruptly into the room with heightened colour and broken utterance, and bursts into tears in the midst of an impassioned declaration that she cannot stay in the house another day. Her bewildered employer seeks refuge in flight, but finds her fellow-servant in a fainting state at the foot of the stairs, and is forced to hear her version of the story. After this there are only two courses open to him; either to dismiss the servants, shut up the house, and throw himself, with the humility which befits a returned prodigal, on the mercy of his former landlady; or, by proposing to the first eligible woman whom he may chance to meet, to prepare the way for leisurely repentance.

THE PORTRAITS OF CERVANTES.

THERE are not many faces among those of the great men of the past that seem so thoroughly familiar to us as the face of Cervantes. The very name is enough with most of us to call up the image of the well-known features, and almost any one with a moderate gift for portraiture could sketch them from memory so that nine persons out of ten would at once recognize the likeness. It is a pity that a faith like this, in itself so striking a proof of the personal affection the world feels for the great novelist, should have no foundation to rest upon; but such, unfortunately, is the case as regards the reputed portraits of Cervantes. One authentic portrait of him we certainly do possess, the one drawn by himself in the prologue to the *Novelas Exemplares*; but of the portraits which appeal to the eye there is not one with any better voucher of authenticity than can be shown for the early Scottish monarchs in the Holyrood Gallery. It may not be amiss, perhaps, to review the evidence on which they stand, especially as one of them has been lately put forward in a new and very inviting form.

Taking the portraits which claim to represent Cervantes in the order of their appearance in public, the first is that which was prefixed to the handsome edition of *Don Quixote*, in four volumes, large 4to., published in London, in 1738, by Jacob Tonson, under the patronage of Lord Carteret—the first of all editions, it may be observed, to recognize the rank of the book as something above a mere popular romance not worth editorial or artistic care. This portrait made no pretence whatever to authenticity. Dr. Oldfield, who appears to have been editor-in-chief, apologizes for putting an emblematic frontispiece in the place of honour, saying that with all the exertions they had made ("por mas solicitud que aya puesto") they had been unable to find a portrait of Cervantes. The search, we must presume, extended to Spain, for naturally the first person to be applied to would be Don Gregorio Mayans y Siscar, who had been engaged to write the life of Cervantes for the edition, and who, as the first scholar and critic in Spain at the time, would be in a position to give valuable advice and assistance in a matter of the kind. They had, too, the help of Pedro de Pineda, who no doubt was able to aid in setting inquiries on foot; so that, on the whole, we may fairly assume that, as the undertaking was one on which no expense was spared, the search was not abandoned until it was seen to be hopeless. Unwilling, however, to send the book into the world without some kind of effigy of the author, the editors decided to have a fancy portrait executed and prefixed to the life by Mayans y Siscar. It was described as "Portrait of Cervantes by himself" ("por el mismo"), meaning that it was founded upon the portrait in words given in the prologue to the novels and quoted in full by Mayans y Siscar at the end of his memoir. Vertue was the engraver, and the designer was Lord Burlington's versatile *protégé* Kent, architect, landscape-gardener, portrait-painter, and sculptor; a clever but unquestionably second-rate artist, whose best-known work, the Shakspeare in Westminster Abbey, this Cervantes portrait strongly resembles in manner and treatment, so far at least as a drawing can resemble a statue.

The next in date was that published by the Spanish Academy in their noble edition of *Don Quixote* in 1780, "Ibarra's *Quixote*," which, as Ferriar says,

> charms the sight
> With faultless types, and costly sculptures bright.

They, too, wished to grace their edition with a portrait, but were naturally reluctant to reproduce so unsatisfactory a work as the Kent and Vertue engraving, the only one that seemed forthcoming. At length, however, after much inquiry, it was ascertained that a certain Count Aguila at Seville was in possession of an old portrait, said to be of Cervantes; and to him the Academy applied for leave to examine the picture—an application to which the Count responded with patriotic generosity, not only sending the picture, but presenting it as a gift. But when Count Aguila's picture came to be examined, it was found, to the amazement of the Academy, that as a portrait it was substantially the same as the London engraving, and that, in fact, to use their own words, "one must of necessity be a copy of the other" ("el uno debia ser precisamente copia del otro"). Perplexed by this curious coincidence, they applied once more to Count Aguila. All the information he could give was that he had bought the picture some years before from a picture-dealer in Madrid, who had sold it to him as a work of Alonso del Arco, a painter born about ten years after the death of Cervantes. The matter was then referred to the Directors of the Academy of Fine Arts of San Fernando, who reported, after due consideration, that the painting was older than the engraving, founding their opinion on the mellowness (rancio) of its tone and the appearance of the canvas, which seemed to be of the preceding century. They added, moreover, that the painting could not have been copied from the engraving, because the face looks the opposite way, which would not be the case if it were a copy, and is just what would be the case if it had served as the engraver's original; and their conclusion was that, while it was clearly not a portrait painted from life, it was not a mere fancy portrait, but very possibly a copy of an older

and better work of the time of Cervantes. How far this was thought satisfactory by the Academy we cannot say; but at any rate they had the portrait engraved by Carmona for their edition; and it is from this engraving, or else from the production of Kent and Vertue, that publishers have drawn their portraits and the public taken its ideas of the features of Cervantes ever since. As to the relation between the two, it is plain that the theory of the San Fernando academicians was that the London portrait was a copy of the Aguila painting. But this is a theory that cannot hold its ground for a moment. Not to speak of the improbability of such a trick on the part of the promoters of the London edition, the inconceivable silliness and stupidity of the suppression make it absolutely impossible. It would have been an incomprehensible policy indeed for the editors, after having been at the trouble and expense of finding and engraving the portrait, to pass off the copy of it as the pure invention of their own artists, thereby defeating the very object they had in view. If they thought the portrait untrustworthy, they need not have engraved it; but to engrave it and then publish the work as a result of their own fancy, inserted because they had nothing better to offer, would have been something beyond stupidity and folly. If it was worth engraving it was worth owning, and however doubtful its date and pedigree might have been, it would have served their purpose better than a confessedly imaginary work. If, then, the deliberate opinion of the Spanish Academy be correct, that one must be a copy of the other, it follows that Kent's drawing must have been the foundation of the Aguila painting; nor, as any candid critic will own, is there much in the arguments of the San Fernando experts against such a conclusion. The first thing that a painter would think of when about to concoct an "old portrait"—for this, of course, must be the hypothesis—would be a canvas of suitable age, an article very easily procured, and there are more ways than one of obtaining a proper mellowness of tone. And then as to the face looking left instead of right; it is very unlikely that the painter, under the circumstances, would have had recourse directly to the engraving in the London 4to; much more likely that he would have copied from some more readily accessible reproduction of it in which, as usual, the position of the face would be reversed—like that, for instance, in the Hague edition of the "Novelas" in 1739. The conclusion, in short, must be that, while there is not a scintilla of evidence to prove the picture a genuine portrait of Cervantes, there is very strong presumptive evidence that it is nothing more than a fabrication founded on Kent's fancy portrait.

So much for the current likeness of Cervantes; but there are one or two other claimants to be noticed. About fifteen years ago an interest nearly as great as that created in Florence by the discovery of Dante's features on the wall of the Bargello was produced in Seville by the announcement that a portrait of Cervantes had been discovered in the Museo Provincial, formerly the convent of La Merced, in a picture attributed to Pacheco, the master and father-in-law of Velazquez. It had always been an article of belief that Pacheco had made a portrait of Cervantes, as he kept a kind of album in which he inserted pencil or crayon likenesses of illustrious or distinguished personages at Seville. There is no proof, however, that Cervantes had a place in the book, and certainly there is no trace of him in the MS. volume, which is said to be the original, or at least a fragment of the original, of Pacheco. Nor indeed, *à priori*, does it seem very probable that, even as author of the *Galatea*, poor Cervantes picking up a precarious livelihood on the wharfs of Seville would have come under the category described by Pacheco. The glory of *Don Quixote* is apt to blind us to the obscurity in which its author lived. However, the belief helped to favour the theory of Don José Asensio y Toledo, who, on the authority of a MS. of unknown date and authorship, but claiming to be a relation of affairs at Seville from 1590 to 1640, announced that there was a portrait of Cervantes in a picture by Pacheco representing Redemptorist Fathers releasing Moorish captives at Algiers. On examination the only picture by Pacheco that seemed likely to be the one meant in the MS. was a "Scene from the Life of San Pedro de Nolasco," in which, Don José maintained, the head of the Saint was a portrait of the Padre Bernal, who had been active in releasing captives at Algiers, and whose portrait Pacheco speaks of having painted. In this picture, therefore, he concluded the portrait of Cervantes was to be found, and he found it in the head of a boatman in the foreground, who is holding his boat ready for the embarkation of the Saint. The evidence, it will be, perceived, hangs together very loosely. In the first place there is no proof that the MS. is an authority worth paying any attention to; then, the identification of the Museo picture with the one referred to in the MS. cannot be said to be made out; nor, again, the identification of the boatman with Cervantes. And there are several arguments against the latter. Is it likely that a painter, wishing to introduce a characteristic portrait of a man like Cervantes, would have chosen to represent him as a boatman? Cervantes at the time of his release from Algiers was between thirty-three and thirty-four, and the boatman in the picture is at least ten years younger; he has only the beard of a very young man, while Cervantes was a remarkably full-bearded man, and in his description of himself written at Algiers describes himself emphatically as "bien barbado." When Pacheco knew him, if indeed they ever met, Cervantes was past fifty, and the painter reproducing his features afterwards would have been more likely to err in the other direction by painting him older than he really was at the time of his release. It is plain that the boatman in the picture has the perfect use of both hands and arms. That Cervantes had literally *lost* his left hand is doubtful; but that he had lost the use of left hand and arm—"lost the movement," to use his own expressive phrase—is beyond a doubt; and this was a fact which no sympathetic painter (and Pacheco was a poet as well as a painter) would have suppressed or slurred over, being, as it was, a pride and a glory to the man of whom he was striving to produce a characteristic memorial. These are among the difficulties that suggest themselves against the claim Don José has set out, with no less ingenuity than enthusiasm, in his *Nuevos documentos para ilustrar la vida de Cervantes*, to which a copy of the portrait is prefixed.

For the portrait we mentioned as having been lately republished there is even less authority. This is the one which has been reproduced by the Woodbury process in the gallery of "The Hundred Greatest Men," now in course of publication by Messrs. Sampson Low and Co. It is from a fine line engraving by Charles Bouvier, published in 1825 by the Société des Arts of Geneva, by whom it was described as a portrait of Cervantes, and after a painting by Velazquez. For neither assertion is there the slightest authority beyond the *ipse dixit* of the Société; and they are in a manner contradictory, for Velazquez was a boy of sixteen when Cervantes died, so that, if this, which is obviously a portrait from life, is a portrait of Cervantes, it cannot be his work, or, if it be his work, it cannot be a portrait of Cervantes. But there is, in fact, no ground for supposing it to be one or the other. The original painting in the possession of Dr. Briere, of Yverdun, has no history or tradition in any way connecting it with Cervantes, Velazquez, or Spain, and the ascription is entirely the conjecture of the Société des Arts. The painting of the head, which is all that the engraver has reproduced, is certainly somewhat in the manner of Velazquez; but no other part of the picture, which is a large one, resembles his work in the slightest degree; and as to the possibility of its being a portrait of Cervantes, the costume alone is decisive. The broad falling collar, as we know by contemporary portraits, did not come into fashion until long after his time; nor was the hair in his day worn long and bushy as it is in the picture, in which moreover it is grey, while in the case of Cervantes it was, as we know, still "chestnut" when he was drawing close to seventy. The details too—as for instance a lute lying on the table beside the figure—are inconsistent with the notion of Cervantes being the subject. It is as well perhaps that there is no case to be made out in this instance, for the face is not one that would be acceptable to any one who loves the author of *Don Quixote*. There is both humour and character in it, but it is not the sort of face from behind which we should expect the conception of the dear old visionary of La Mancha.

In short, though editors and publishers will no doubt to the end of time continue to present the public with portraits of Cervantes, the best they have to offer is not more trustworthy than the old blind bust that does duty for the likeness of Homer. It is not, of course, impossible that an unimpeachable portrait may yet be found, but the chance is certainly a remote one. There are only two distinct traditions in Spain of portraits of Cervantes. One has been already mentioned in connexion with Pacheco; the other is of a portrait painted by the poet Juan Jauregui, to whose skill as a painter Lope, among others, bears testimony. This depends upon the words of Cervantes himself in the prologue to the "Novels." He is there grumbling about having to write another preface, a labour which the friend who urges it might have spared him, he says, by having him "engraved and sculptured" on the first page of the book, "according to use and custom." This is plainly a sly hit at Lope de Vega, who was much given to publishing his portrait in front of his books, especially that very handsome and youthful one originally prefixed to the *Arcadia* in 1598, of which a new impression had appeared not long before this was written, and in humorous contrast to which Cervantes may have drawn the picture of himself. "For," Cervantes continues, "the famous Don Juan Jauregui would give him my portrait." From this it has been assumed that Jauregui had actually painted a portrait. But the words "le diera mi retrato" do not necessarily imply anything of the kind. It is far more likely that they are nothing more than an instance of Cervantes's way of paying a good-natured passing compliment to a friend—a thing he was very fond of doing; that it is, in fact, as though he said, "If my portrait were to be made, there is no painter I should be so well satisfied with as Don Juan." It is very unlikely that there ever was such a portrait, for it is hard to see how it could have totally disappeared without leaving some trace behind it. When portraits disappear it is generally because their existence is unknown to those interested in the subject, or because they fall into the hands of people who set no value upon them, knowing nothing about their originals. But in this case everything was favourable to the preservation of the picture. Jauregui was a man of rank and position; he survived Cervantes for more than a quarter of a century, during which the fame of his friend spread far and wide; the "Novels" had been printed nearly a score of times, advertising this portrait to all the world. It would naturally have been treasured by its possessor, and known to a wide circle of men of taste and culture; and under such circumstances, even if the original did mysteriously vanish, surely some record of its existence would remain; if not a copy made for some *Quixote* worshipper, or an engraving procured by some enterprising bookseller of the Low Countries, at least some allusion, description, or reference to it from some one of the many contemporaries to whom it must have been well known.

On the whole, it seems probable that the world will have to

remain content with the likeness drawn by the pen that drew Don Quixote and Sancho; and there are, after all, touches in that which no painter could have rendered so well. A painter might better bring before the eye the "aquiline features," the "chestnut hair," the "beard of silver that was gold not twenty years ago," the nose "hooked but shapely withal"; and possibly he might manage to indicate those six remaining teeth, "ill-preserved and worse placed"; but no painter could put before us on canvas the "smooth, untroubled forehead, and cheerful eyes," as we see them in the playful little picture of himself which the great novelist has sketched for us. And these are the features that are best worth remembering, reminding us as they do that the long hard life of struggling poverty, neglect, failure, and disappointment was borne to the end with the spirit of a gallant soldier and the serenity of a true philosopher.

THE UNDERGROUND RAILWAY OUTRAGE.

It is to be hoped that no philanthropic association of persons for the protection of criminals will attempt to create an agitation against the firm and just sentence passed by Mr. Justice Stephen upon Henry Perry, who was convicted on Wednesday last of the crime of robbery with violence. The facts of the case were so simple and so glaring that the counsel for the prisoner had absolutely no resource except to attempt a line of defence which the Judge pronounced to be intangible. He tried to show that the prisoner had no intention of committing the serious crime of murder, but had only endeavoured to render his victim temporarily insensible in order to facilitate the robbery. The learned Judge very properly ruled that this was no defence at all, that counsel could only speak to the jury upon the facts, and that anything in mitigation of the sentence must be said after the verdict and to the bench. The prisoner, therefore, had practically no defence, but stood convicted, as it were, on his own confession.

It may be well before making any comments upon this somewhat remarkable case to give something like a summary of the facts. "Clarence Lewis, the prosecutor, about eighteen years of age," is an apprentice to a firm of tea-dealers at Aldgate and Kensington. He, being employed at the Aldgate branch, went on the 21st of August last "to Kensington, according to the usual practice, to fetch the cash." The sum given to him amounted to 105*l.* in cheques and gold, and, having put the bag containing it in his pocket, he went to the Kensington railway station to take the train. Here at the door he saw the prisoner, who attempted to claim acquaintance with him, followed him to the platform, and persuaded him to get into a first-class carriage with him. It might seem odd that the prosecutor so readily yielded to this persuasion; but it must be remembered that the prisoner was several years older than the prosecutor, that people can hardly be expected to suspect a possible assassin or robber in every chance person who makes conversation with them, and that a carriage on the Underground Railway is not at first sight a likely place for the commission of such a crime as that of which Perry has been convicted. Nor perhaps is it probable that, at first, Perry had any idea of committing his crime in the particular shape which it finally assumed. When he had got his victim into the carriage he began proceedings by asking him, with a curious naïveté, to taste some liquid in a bottle which he had with him, and which he said was "Zoedone, a mineral water. I did so," continued the prosecutor, in his evidence, "and it nearly choked me." Perry then, with amazing belief in the stupidity of his fellow-creatures, "poured something out of a bottle on to a handkerchief" and asked Lewis to smell it, which Lewis naturally refused to do. Then he offered Lewis some port, which also was naturally declined, and then the prisoner seems to have lost altogether the very small amount of circumspection which he displayed at first. His plan, if plan it can be called, was interrupted for a time by a lady getting into the carriage; but as soon as she had left it, he dealt Lewis a violent blow on the head with a stick which he carried, and having stunned him, continued, when he came to his senses again, "beating and kicking me about the head and body, and then tried to take the bag of money out of my pocket." The prisoner, it should be observed, had himself been for a time in the service of the tea-dealers who employ Lewis, and was aware that "it was the practice every Saturday to send a large sum of money from the Kensington establishment to Aldgate." After the beating and kicking had gone on for some little time, the train stopped at the Farringdon Street Station, where the prosecutor called for help, "but no one came." After the train had gone on again, Perry asked Lewis to tell him where the money was, which Lewis, with commendable pluck, refused to do. He then continued his beating of Lewis, apparently found out the pocket in which the money-bag was, and, with a diabolical ingenuity which he had not displayed before, tried to push Lewis out of the carriage door. "I begged him not to do so, and said he would kill me." Luckily he failed in this part of his attempt; and luckily also, when the train stopped at Aldgate, Lewis had strength enough to run after the prisoner and cause him to be arrested. "At this time," said Lewis, "I was very much injured, and was bleeding from my head and my hands"; and he was for ten days afterwards an in-patient of the hospital where he is still an out-patient.

It would have been useless to attempt to combat seriously the facts given in evidence by the prosecutor, and all that the prisoner's counsel could do was to attempt the line of defence already referred to. Two bottles were found upon the prisoner when he was arrested, one containing chloroform and the other "port wine mixed with laudanum in a sufficient quantity to produce insensibility"; and, after the verdict of the jury had been given, it was proved by a colleague of the prosecutor's that the prisoner had the week before attempted, when the witness was entrusted with a sum of money to be taken from Kensington to Aldgate, to make him drink something out of a bottle.

No case could well be more complete against a prisoner, and Mr. Justice Stephen's summing-up and sentence were a model of clearness, judiciousness, and decision. The prisoner, he truly said, "had been convicted of one of the worst offences that had ever come to his knowledge." It was obvious that he had hoped to render the prosecutor insensible by hocussing, and to leave him under the suspicion of misappropriating the moneys entrusted to him—a suspicion which, it may be added, would have weighed heavily upon him, for his story of what actually happened might well have seemed improbable enough if Perry's first attempt had succeeded. Failing in this, he "had resorted to the most brutal violence," and, after this "had deliberately attempted to drag the prosecutor to the door of the carriage, intending to throw him out, evidently utterly regardless of the consequences." Commenting further upon the gross brutality of the prisoner's conduct, and the pain and suffering which he had inflicted, Mr. Justice Stephen went on to say that he felt it his duty to give Perry some idea of what physical suffering was, and sentenced him therefore to receive thirty lashes with the cat, and to be kept in penal servitude for twenty years.

This is a sentence which every sensible person must thoroughly approve, but though it completely satisfies the ends of justice, it does not of course immediately touch the general questions raised by the case, with which it was no part of Mr. Justice Stephen's duty to deal. Perhaps the first impression created in most people's minds after reading the case may be one of amazement at so great a crime being attempted in so clumsy a fashion. This, however, may be followed by a reflection as to what might have happened if the prisoner had had a tithe of the capacity constantly possessed by criminals in fiction, and too often possessed by robbers who would not stick at murder in real life. If Perry had succeeded in his attempt to push Lewis out of the carriage, it is possible that the chain of evidence against him might never have been completed. In a certain sense there was some ingenuity in the very audacity of the crime; for, as has been said, a railway carriage which stops every few minutes seems a very unlikely place to select for the commission of such a crime as Perry's, whether it takes the shape of hocussing or of violence. And to this fact it is possibly due, in part at least, that "no one came" when Lewis cried for help at Farringdon Street Station. No one, of course, would imagine that such a scene had taken place or could take place under such circumstances. It is the more important therefore that whatever steps can be taken should at once be taken to guard against the possibility of such a scene taking place again. It is more easy of course to say this than to point to an efficient remedy. Absolute protection against a completely unforeseen form of crime is impossible; and it is only a question to what degree protection can be ensured. The adoption of the American "car" is an obvious suggestion; but it must be remembered that the car might be practically useless without a conductor to patrol it. The evidence in this case points to the fact that Lewis was as much protected as he would have been in an ordinary saloon carriage, for the division between his carriage and the adjoining one did not run up to the ceiling, and could be looked over. But there happened to be no one in the next compartment, and in the same way of course it might happen that there might be no one in a "car," however spacious, except a robber or robbers and his or their victim. The fact that the prosecutor's cries for help at a station were unheard or unheeded is more curious, and calls for explanation. In any case something should be done, and done quickly, if only on the lowest motives, by Railway Companies to allay the sense of insecurity which the hearing of this case is certain to create in the public mind. The Underground Railway, in spite of its undoubted convenience, is not so perfect and pleasant a means of transport that its directors can afford to throw in the chance of their passengers being fallen upon, robbed, and possibly murdered, as a makeweight to its advantages.

TRAVEL IN SOUTH AMERICA.

The crush of home politics and anxieties as to our foreign affairs have interfered with an interesting sequence of letters from a Special Correspondent of the *Times* in South America. Those letters are well worth studying for the light they throw on the present condition of a continent that is steadily developing immense capabilities, in spite of spasmodic *émeutes* and a climate that is often enervating. We hear of significant changes that may seriously affect the prosperity and credit of countries in which English investors are interested. In three cases out of four the confiding capitalists who lent their money on the faith of seductive prospectuses have long ago discounted their losses and left all hope behind. But even States which have hitherto enjoyed deserved consideration see their future seriously compromised by circumstances they cannot control. There is Chili, for example.

Of course the costs of the war that was forced upon her must weigh heavily on her finances, and the Correspondent believes that the possible prizes of victory may prove to be curses in place of blessings. It is probable that when she signs terms of peace with Peru, Chili may insist on the cession of the frontier districts and islands, which contain valuable deposits of minerals and guano. Those early sources of lightly-won wealth have in reality impoverished the people that has hitherto possessed them, and there is the possibility, at all events, that a change of ownership may carry with it similar consequences. Chili has kept her credit on the Bourses of Europe chiefly by the hard-working habits of her agricultural population; and the acquisition of shorter cuts to fortune may conspire with the atmosphere to demoralize the Chilians. Independently of that, however, one of the staple exports of the State is being enormously affected by foreign competition. For long she has shipped from her overflowing granaries her surplus bread-stuffs, for the support of her Peruvian neighbours. But since the rich arable lands of the Californian coast, and notably the deep bottoms of the Sacramento Valley, have been turned into wheat farms that are practically limitless, the Chilian grain dealers have been undersold by consignments sent from San Francisco. And, so far as sentiment exerts any influence on trade, the heart-burnings that have been created by the struggle with her northern neighbour must inevitably have a tendency to tell against Chili.

We have directed attention to an illustration of the commercial value of these letters for the sake of those who are financially interested in South America. But their great charm for the general reader lies in the pictures they give of the grand scenery of the continent and of the manners and modes of life of the people; with their information as to means of travel, and the steady development of international communications. It seems almost out of place to speak of "touring" in connexion with the distances that are to be traversed, and the natural obstacles that must be surmounted. Touring suggests short and easy stages; careful registering of baggage and comfortable first-class railway carriages; sumptuous hotels or snug inns, with staffs of self-interested servants zealous to dance attendance on the tourist. In South America you find comparatively few of these things; and the half-breed natives in the half-settled districts still regard the stranger with the feelings of the mining rough immortalized by Leech. Only the half-brick which the English miner would have heaved takes the shape with South American Indians of an arrow-shot or a spear-thrust. At the same time, you need seldom face dangers of the kind, unless you deliberately choose to turn aside in search of them. At the very worst, when "establishing connexions" across the continent, to borrow the phraseology of Americans of the North, you have but to run the gauntlet of such chance perils through some days of forest riding from the terminus of one line of railway to another. For the progress those South Americans have made in railway construction has been really marvellous, all things considered. Undoubtedly the Grand Trunk lines, in their present stage, very frequently lead nowhere in particular. When they are not carried along parallel to the coast, stringing the thriving seaports together—in which cases, of course, they are useful and profitable—they generally tend ambitiously skywards, towards the summits of the Andes. The Cismontane Companies are reaching hands towards those Transmontane Companies which are opening up the pampas and the virgin forests. But the Western section often ends at the base of a precipice, with condors soaring picturesquely overhead; while the Eastern has come probably to a temporary standstill at some "one-horse" backwood city in the swamps. Out of Chili or the Argentine Republic, at all events, no one has probably suffered much, save the confiding European investor who indirectly supplied the funds for the enterprise. The great landowners, the mining Companies, and the native merchants of the inland towns have found a quick and cheap means of transport for themselves and their produce. The English or American contractors who promoted and constructed the lines have been paid, and paid liberally. And the traveller who would inspect the glories of the mountain ranges is enabled with ease to accomplish a journey where the game would formerly hardly have been worth the candle. For, as a rule, in the Southern hemisphere of America, while there must be many points of view which are absolutely matchless for rugged grandeur and stupendous sublimity, the characteristics of the scenery are monotony and aridity. On a clear day from the summit of the Cordillera you might look with the eye of the poet from that throne of clouds over half the world. Nevertheless working one's way from the plains to the summit on muleback would be a heart-breaking and interminable business. The paths lie for the most part in the beds or along the rills of the *arroyos*, or water-courses, that come down in flood for a brief space in the rains, and are choked in dust through the rest of the year. The scorching sun has powdered the friable rocks, and except on the patches of soil in the neighbourhood of water there is hardly a sign of vegetation anywhere. The people have no notion of irrigating. The swollen torrents run to waste in the rains, and the streams that are perennially fed from the snowfields shrink into trickling brooks in the height of the summer. But the dreary chasms of these heat-stricken deserts have been bridged over by railways ingeniously devised. The engineering feats of South American contractors throw into the shade the achievements that one admires on the Sömmering. You may take a through ticket on the sea-coast and be delivered at your destination with a very moderate expenditure of vital energy, the heat and the dust notwithstanding. Then your troubles begin with a fresh base of departure in some mountain or mining city where you have been hospitably welcomed; and you must fall back upon four-footed beasts for the transport of your belongings, if not of your person. But we fancy that on those heights the riding is seldom disagreeable. While the lower ranges have been denuded of their timber, the forests beyond the reach of the woodman have been spared. There is shade under the leaves and fresh air in the openings; and at that elevation there is far less of the density of undergrowth which makes the forests in the Brazils almost impervious. Rising above the line of the trees and the scrub, it becomes of course a simple question of scrambling; the worst of it being, that when the climb has been accomplished, the odds are almost anything against the view you came in quest of.

The remarks on this subject in the letters of the *Times'* Correspondent are fully confirmed by the despatches from Mr. Whymper. The peaks of the Andes are almost invariably wreathed in dense volumes of drifting vapour, so that the adventurous mountaineer has his exertions for his pains. As to monotony in the scenery, you find it as much in the pampas or the *llanos* as on the lower ribs of the rocky backbone of the Continent. You may ride for many days across limitless plains, where you are often buried out of reach of any air that may be stirring in the rank luxuriance of reeds and grasses, and where each successive clearing you emerge upon exactly resembles the last. You are oppressed by the same sense of vague immensity when coasting the endless seaboard. No line of coast elsewhere on the globe, the shores of Australia not excepted, are so little broken by bays or headlands. The introduction of steam navigation has not only economized time, but saved an infinity of precious lives and property. Where the traveller does find the perfection of picturesque marine scenery, as the *Times'* Correspondent pointed out in a recent letter, is in threading the intricate archipelago of islands, rocks, and shoals, that lie stretched between Patagonia and Terra del Fuego. The perils and the beauties of that complicated inner passage must make the mouth of the spirited ocean-yachtsman water. The Correspondent tells of common forecastle men, who were in the habit of making the trips through those straits as a matter of business, awestruck by the irresistible sublimity which impressed them on each fresh occasion as forcibly as ever. Nor was that wonderful. For in the height of the Antarctic summer, "the narrow passages still wore a polar look; the glaciers slid down in perpendicular sheets from the brow of the hill to the water-edge; the waterfalls in the glens seemed to hang frozen in the air like crystal columns, and although neither the wind nor the storm reached us, we could see far up on the mountain summits, when a rift in the cloud laid them bare, the surface all covered with fresh-fallen and thick-fallen snow, drifting into wreaths, and heaving into heaps as it flew eddying before the blast." The slip of a mass of ice from these overhanging glaciers might lash the pent-up waters in the channel into fury, and possibly block the passage. But the crowning effect was in the charms of contrast. While winter reigned undisturbed on the heights, the lower slopes were covered with the brilliancy of summer vegetation. There was "a juxtaposition of ice and flowers, of snowy summits and grassy slopes, of blue glaciers bordering on green meadows and yellow corn-fields, and of icicles hanging on the branches of budding trees."

So far as we can judge, we should say that one of the chief drawbacks to South American travel was the difficulty of finding satisfactory Capuas in which to recruit in the intervals of campaigning. Rio de Janeiro is perhaps an exception. There, at least, are infinite beauties of tropical scenery by land and sea, though the hotels, with a single suburban exception, leave, as we understand, a great deal to desire. But elsewhere the monotony of the mountain scenery is reflected in the uniform aspect of the cities, as well as in the habits of the national life. The cloudless climate seldom changes, while the Peruvians must make the best of it in a perpetual cloud-haze. It is true that the foreign residents are universally hospitable; but, after all, one hardly cares to cross the world for the dinners and dull domestic entertainments that have become a weariness of the spirit at home; and, on the whole, we are of opinion that travel in South America can only commend itself to exceptional temperaments.

THE EXPECTED DRAIN OF GOLD.

FOR some time back the business community has been disturbed by the apprehension of a large export of gold to the United States during the autumn. Were such an export to take place, it would drain away the reserve of the Bank of England, and, in bankers' phrase, raise the value of money—that is to say, raise the rates paid for the use of capital in the short-loan market. The effect of this would be either to trench upon the profits of legitimate trade, or else to enhance the prices of commodities, and in another direction to increase the risks of speculation, by adding to them the danger that advances might be obtainable only on conditions which would render the success of the speculation impossible. For a while these apprehensions became so acute as almost to deserve the name of a scare; but since the publication of the Bank of England return last week they have greatly diminished, until now the general disposition seems to be to look upon them

as wholly unfounded. To which of these views does the balance of probability incline?

The first point to inquire into is the American demand. As is well known, the money of the United States at present is of five different kinds—gold coin, silver coin, gold and silver certificates, greenbacks, and bank-notes, of which all but the latter are legal tender. The gold and silver certificates, however, we may leave out of account, because they are neither more nor less than receipts for the deposits of the precious metals, and obviously can be added to only by the import or production of the bullion they represent. The silver coins likewise may be left out of account, since they are not current. They are being struck by the American mints at the rate required by law, but they accumulate in the vaults of the Treasury, and are practically of no more use to satisfy a currency demand than if they were in Japan. Of the three remaining kinds of money, the greenbacks are fixed in amount by Act of Congress, and can neither be increased nor diminished without a change in the law, whatever may be the scarcity or overabundance of the circulating medium; while the legislation respecting bank-notes imposes such onerous conditions on their issue that in practice their amount hardly increases. The result is that, if an augmentation of the currency is required, it can be made only by an addition to the gold. We have evidence of this in what has been going on since the resumption of specie payments at the beginning of last year. In the interval the bank-note circulation has been increased only by 2,688,000*l.*, while 28 millions sterling have been added to the gold currency. The question is whether this increase of over 30½ millions sterling has or has not given the country all the money which it requires. Periods of great and expanding prosperity, such as the United States are now enjoying, always require large additions to the currency. A vast multiplication of commercial transactions is the characteristic of such periods. More railways, ships, factories, shops, and houses are built than usual; more iron and coal and other minerals are produced; more goods are manufactured. In consequence more workpeople are employed and at better wages. The great body of the people have thus more means of outlay, and consumption is increased. The consequence of this general increase of expenditure is that the old medium of circulation is found to be insufficient. It is augmented, if there are the means of augmenting it; if not, it rises in value—that is, acquires additional purchasing power. During the period of inflation upon which the United States have now entered, the currency, as we have just seen, has been increased by over 30½ millions sterling. The point which we wish to ascertain is whether a further large addition is to be expected. To ascertain this with any confidence we require the teaching of past experience; but such teaching, strictly speaking, does not exist. The United States have been a gold-using country, in the full sense of the words, only for twenty months. For seventeen years previously they had been under the *régime* of inconvertible paper; and before the Civil War their economic condition was so unlike what it is to-day that it would be sheer waste of time to go back to that epoch. Still we are not entirely without a guide. A writer in the *Statist* pointed out three weeks ago that, when the last period of inflation set in on the accession of General Grant to power, the inconvertible paper currency rose in purchasing power in the first two years of expanding trade just 25 per cent. But the addition actually made in the last twenty months is about 22 per cent. In other words, if we may assume that the addition to the currency will be in the same proportion now as the increase of purchasing power was after 1869, that addition between now and the end of the year will not exceed 4½ millions sterling.

But are we justified in making the assumption just stated? It is impossible to answer this question with any confidence. It may be observed, however, that the last ten years have made an immense addition to the population of the United States, have vastly extended the cultivated area, have enormously expanded their trade, and, in particular, have given them an unprecedented control of the food markets of Europe. It is not unreasonable to suppose that a country so much more populous, active, and rich than it was before, requires a proportionately larger currency. But, on the other hand, there has during the ten years been a great development of banking, which of course tends to dispense with the use of cash in a variety of transactions. Yet there is another consideration which must not be lost sight of. It is that the West and South are essentially agricultural, and that in all agricultural communities there is a great expansion of the circulating medium in the autumn. The crops have then to be cut and got in; the corn has to be threshed and sent to market; the cattle fed upon grass during the summer have likewise to be disposed of; and provision has to be made for winter operations. In the case of the United States the fertile lands which produce the wheat, maize, pork, tobacco, sugar, rice, and cotton consumed in Europe lie thousands of miles, for the most part, from the port of shipment. And these commodities have to be sent long distances, perhaps, to the nearest railway station, and have then to be conveyed hundreds, or it may be thousands, of miles to New York, New Orleans, Galveston, or wherever the port may be. All these operations involve a vast outlay in wages, the hire and feed of horses, railway and steamboat freight. And, in consequence, every September a drain of cash from New York to the interior sets in, and continues till very close upon the end of the year. Twelve months ago this drain was so exhausting that New York was obliged to draw from Europe 15 millions sterling in gold. The experience of 1869-70, as the writer in the *Statist* observes, would suggest that this enormous import, reinforced by the subsequent production of California, will nearly suffice for the needs of this year. But, on the other hand, it is to be remarked that, notwithstanding the Californian production, not a penny of the 15 millions in question has been returned to Europe, from which it would seem that even in the summer, which is always a slack season in agricultural countries, the currency of the United States was not excessive with the present activity of business and high range of prices, and consequently that it will be insufficient for the exceptional demands of the autumn.

Assuming that the United States will require before the end of the year 4½ millions sterling in gold, and possibly much more, the next question is whether they have the means of obtaining it from London. It is said that our harvest this year is good, and so is the harvest generally over Europe; that consequently we shall not require anything like the quantity of grain which we had to buy twelve months ago, and therefore shall not owe so much to the United States; that, on the other hand, the American people will require our goods—iron, machinery, cotton, and so on—which will further reduce the debt; that, if a balance remains, we can liquidate it by sending out securities; and that the Americans will much prefer goods or stock to gold which can be of no use to them. There is force in these arguments; but they are all based on the assumption that the Americans do not require additional currency; which may be quite true, but is not suggested by the foregoing inquiry, and certainly is not to be assumed. If they do require additional currency, they will as easily find means to get it as to get iron or any other commodity. As for the contention that, our harvest being good, we shall not need so much American corn as we required last year, it is to be borne in mind that a low price stimulates consumption, that we have to replenish stocks seriously exhausted, and that if we do not take wheat we shall take something else—beef, pork, butter, and so on. The Americans have an immense supply of articles of food which we require; and, if they choose to stimulate the sale, they can always do so by reducing prices low enough. If they would lose by so doing, they would lose still more by allowing the articles to perish at home. We may dismiss therefore as nonsensical the talk about the inability of the Americans to obtain whatever supply of gold they may really require. Another argument is that France and Germany will have to provide most of the gold which America may take, as they are at present doing. But the stock of the metal held by the Banks of France and Germany is now so small that it is contended, on the other hand, that they cannot afford to part with much more; and, in fact, to prevent the loss, the Bank of Germany has already put up its rate of discount as high as 5½ per cent., while the Bank of France maintains a premium on gold of over ½ per cent. The rates in the outer market in Berlin are following those of the Bank, and large sales of stock are being made in London to obtain command over the money market here; and in France the excessive amount of light coin is interposing an obstacle in the way of shipments. But we have not space to discuss this part of the question. We would only observe that a good deal may be drawn from the French circulation, or that by the sale of securities France and Germany may transfer to ourselves part of the burden of finding gold to satisfy the American demand.

THE ST. LEGER.

With the week in which the St. Leger is run begins what may be called the second part of the year's racing. Although in these days there is racing of some sort almost all the year round, the best of it is practically divided into two parts. The first begins about the middle of April at Newmarket, and then follow the Epsom Spring, the other Newmarket meetings, Epsom summer races, Ascot, and Goodwood. This brings us to the end of July; and, although there is a great deal of racing during August, no races of great importance take place again until near the middle of September. After six weeks of comparative quiet, we begin the second part of the racing season with Doncaster, and then come the Newmarket autumn meetings, after which the season soon closes. Racing fixtures are arranged to fit in conveniently with the other occupations of sportsmen. The following is pretty much the programme of what sporting men consider a well-spent year. When the hunting season ends, in the spring, racing begins, and continues at its height until the end of July. Then it is time to think about going to Scotland, and the best of the grouse-shooting and some deer-stalking carry on matters until near the middle of September, when Doncaster begins. Then come partridge-shooting and the Newmarket autumn meetings, a week's shooting and a week's racing alternating for about six weeks. With the beginning of November the hunting season begins, and this, varied with pheasant-shooting during the frosts of December and January, carries matters on till it is time to begin the same profitable round again in the next spring. To men who spend their lives in this manner the St. Leger is a particularly attractive race, as they return fresh to racing after their month's shooting, and they find it pleasant to compare notes with friends about sport in the Highlands. Then Doncaster is an agreeable meeting in other respects, and the racing is generally of an interesting description. There are many hospitable country houses within a drive of Doncaster, and the days spent at them for the races are usually very pleasant. In the town there are many little parties in hotels and lodgings, and those who wish to buy yearlings or to bet at the subscription

rooms generally prefer remaining at Doncaster to staying at any of the surrounding country houses.

The St. Leger of the present year was expected to be little better than a match. Nevertheless it was an exceptionally interesting race. The two leading favourites were the first and second in the Derby, and as there had only been a short head between them in that race, it seemed difficult to foretell which would win the St. Leger. The excitement preceding the race had been greatly increased by the dispute about the identity of Bend Or. Altogether, the St. Leger of 1880 was very far from being a tame affair. The great question seemed to be whether Bend Or ought, or ought not, to have won the Derby. It was the opinion of many people that, if Robert the Devil had been properly ridden, Bend Or could not possibly have won. It was urged that the jockey who was riding Robert had eased him when the race appeared at his mercy, and that when Bend Or came rushing up with such a spurt there was no time to set him going again at his best pace. Whatever the case might have been, it must have been clear to every one who saw the Derby that the manner in which Bend Or shot up at the end of the race was little short of a miracle. But the partisans of Bend Or had quite another story to tell. They said that the horse had had sore shins; that he had got off very badly; that he was shut in and shut out in the course of the race; that he had twisted a plate; that he had been obliged "to run round his horses" at a critical point of the race; while some even went so far as to say that a mistake had been made about a ball which had been given to him, and that he was not at all himself when he ran for the Derby, though probably but few people gave serious attention to the latter story. His enemies, however, had another word to say. How was it, they inquired, that if Bend Or was such a paragon of perfection as was stated, he could only just manage to beat Fernandez by a head, after a hard struggle, in the St. James's Palace Stakes at Ascot? It was all very well to say that he had been eased in his work after the Derby; but with ordinary training he ought not, they maintained, to have deteriorated so much in a fortnight. But the champions of Bend Or also had a question to ask. How was it that at the Newmarket July Meeting, Cipolata had beaten Robert the Devil by half a length in the Midsummer Stakes? It was true that Cipolata had had an advantage of 7 lbs. in the weights, beyond her allowance for sex; but, if Robert the Devil was the flyer his friends pretended him to be, he ought to have been able to beat her easily at such terms. Further, they had a right to inquire how so good a horse could have been beaten by Apollo at the Newmarket Craven Meeting. As regards the work done by the two rivals during the summer, it was reported that Bend Or had undergone a very fair amount of training, but that Robert the Devil had successfully gone through one of the hardest preparations ever borne by a racehorse, and that he was as fit and as well trained as it was possible for a horse to be.

Besides the winner of the Derby and the Grand Prix de Paris, the winner of the Oaks was also to start for the St. Leger. It has not been an uncommon thing to see an Oaks winner the first favourite for the St. Leger, and it is proverbial that mares run far better in September than in May; but, although Jenny Howlet had won the Oaks this year by four lengths from a field of a dozen opponents, her chance was little esteemed for the St. Leger. A far better favourite was Zealot, the winner of the Prince of Wales's Stakes at Ascot. This race may be said to be next in importance to the five great three-year-old prizes of Newmarket, Epsom, and Doncaster. On the late occasion, a dozen horses had started for it, including Petronel, the winner of the Two Thousand. Zealot had won very cleverly by a length, The Abbot being second. The Abbot was also to start for the St. Leger. This seemed to be one of the most unlucky horses in training. Whenever he had come out this year he had run well, but he had always been second or third instead of the winner. He had been third in the Two Thousand, second in the Payne Stakes, second in the Prince of Wales's Stakes, third in the Hardwicke Stakes, and second to the great Isonomy himself in the Manchester Cup. On this running there could be no doubt whatever that The Abbot was a horse of high merit; but, in addition to his extraordinary bad luck, his appearance was strongly objected to by judges of horseflesh. He has excellent shoulders, but they are supported upon upright prop-like fore legs, with round fetlocks. His back is simply abominable, his sides are flat, and his flabby quarters look as if they did not belong to him. But, although he is the kind of horse for which we should think no one would care to give fifty pounds as a hack, and in spite of the fact that, according to all accepted rules of equine conformation, he ought not to be able to race, his public running entitled him to a prominent position among the second-class favourites. Cipolata, a filly which, as we have already said, had beaten Robert the Devil, had also beaten the winner of the Two Thousand. She is lightly made, but she is well shaped. It was clear from her previous running that, if the two leading favourites happened to be at all out of form, they would be in danger of defeat from this mare; but if they were themselves, it seemed as if she could have scarcely any chance of beating them. She had not been placed in the One Thousand; but nevertheless, taking her running as a whole, she was generally considered to be the best filly that started for the St. Leger, and she was a far better favourite than Jenny Howlet. It had been expected that Mask would be the third favourite at the start for the St. Leger. He had beaten Zealot by more than a length at even weights at Goodwood, and he had given The Abbot 3 lbs. and a beating in the Payne Stakes at Newmarket. In the Derby he had been third, and it seemed unlikely that he would ever be able to out-gallop Bend Or and Robert the Devil; but still he appeared to have every claim on public running to the post of third favourite. Unfortunately he has a weak hock, and as the time of the St. Leger approached, it was found impossible to bring him out for that race. Much as this was to be regretted, it is some satisfaction to reflect that the St. Leger favourites of this year were singularly free from breakdowns and other disappointments.

We should scarcely be speaking too strongly if we were to say that last Wednesday was the wettest St. Leger day ever known. Wind, rain, and mud made everything wretched. Whatever might be the merits of the favourites, it was certain that they were to compete under circumstances exactly the opposite of those of the Derby day. At Epsom the course had been as hard as a board, and now the two rivals were to try their powers through deep mud. This fact caused betting men to consider carefully whether Bend Or or Robert the Devil was better suited to run well over heavy ground. Many thousands of pounds depended upon this question. If, under ordinary circumstances, after galloping a mile and a half there was only the length of a man's hand between the two horses' noses, it seemed probable that the only thing except illness or accident which could separate them to any extent would be the state of the ground. The general opinion was strongly in favour of Bend Or, and this seemed reasonable enough; for, although Robert the Devil had laid on a good deal of muscle since he had run in the Derby, he was still a light, flat-sided horse, while Bend Or appeared to have power and substance enough to gallop through deep mud. Bend Or consequently became a tremendous favourite, and at the start odds were laid on him. There had not been such a strong favourite for the St. Leger for four years, when 2 to 1 was laid on Kisber. Ten minutes to four seemed rather a late hour to fix for the race. Fortunately the horses came out very punctually, and no time was lost at the post. The twelve starters got into line, and away they went at once, without a single false start. The two favourites were in front, and it looked for a moment as if they were going to settle down to race out their match from the start. They were both steadied, however, in about a hundred yards, and Novice and Incendiary made the running. As regards the pace at which the race was run, we may observe that, if the statistics commonly published of the time occupied by the different St. Legers are correct, the late St. Leger was the slowest that has been run for forty years. Novice and Incendiary kept up the running for about a mile and a quarter, when they had had enough of it, and fell back. Bend Or then came boldly to the front, and there were loud cries of "The favourite wins." It seemed all right this time, for he was not shut in among a crowd of horses, as he was said to have been in the Derby, and the coast was clear between him and the winning-post. He came on gallantly in front for some distance, followed by Cipolata and Robert the Devil. As he was turning into the straight at the bend he did not seem to be going quite so kindly, and it was evident that, at any rate, he was not going to win without having to race for it. In a few more strides he was running like a beaten horse, and one of the strongest favourites that ever ran for the St. Leger was clearly defeated. Robert the Devil then came striding along, and as he ran up the straight had the race all to himself, winning at last by three lengths. Cipolata was third, and The Abbot was only a neck behind her, this being the sixth time that this ill-fated beast has run second or third this year, without once winning or once being unplaced. Zealot was fourth. Bend Or was sixth, but he may have been eased when his jockey found that he could not win. Jenny Howlet, the winner of the Oaks, ran badly.

It might have been satisfactory if Bend Or had confirmed his Derby victory by winning the St. Leger; but, after all, he has had a very glorious career, and his friends can always say in his defence that the course at Doncaster was in a very exceptional state. On the other hand, after his gallant struggle in the Derby, one cannot fairly grudge the St. Leger to Robert the Devil. The two champions have now divided the highest honours of the Turf between them, and let it be ever remembered to their credit that they settled their differences without a lawsuit.

REVIEWS.

KANDAHAR IN 1879.*

It is difficult to say what corrections and additions have been made to this Diary since its first publication in the *Royal Engineers' Journal*; but the narrative has not lost the rare merit of simplicity and freshness. This gallant Major of Engineers takes the public completely into his confidence, and supplies us with every kind of personal and domestic detail about his kit, clothing, and correspondence. We almost know the number of pipes which he smoked when tobacco was his only solace under

* *Kandahar in 1879.* Being the Diary of Major Le Messurier, R.E., Brigade Major with the Quetta Column. Reprinted, with corrections and additions, from the "Royal Engineers' Journal." London: Allen & Co. 1880.

short commons and rough accommodation. We are told, as racing touts might say, the names, colours, and peculiarities of his stud; how his tent was robbed and his gold watch was stolen, and how he recovered it by the exercise of some moral pressure; by how many snipe and partridges, black and grey, he managed to supplement the rations of the Commissariat or his purchases at a travelling store; when one of his children was born, and how very glad he was to get back to his nursery after roughing it on something worse than beefsteaks and porter for about eleven months. Some time in November 1878 he found himself appointed Brigade Major to the Mooltan Field Force, under General Sir D. Stewart, who was making for Kandahar. He accompanied that division and reached the city in January 1879, remaining there until the October following, when he was marked off for employment in India. Though he saw little or no fighting, he had a good deal of experience of the country and its inhabitants; he surveyed, shot, rode about, visited native chiefs, got up sky races, cleared spaces for the troops, pulled down old walls, and made quarters comfortable and healthy for the soldiers; and in all these varied occupations he has shown us no trace of the dictatorial and omniscient "Correspondent." Though he gives a *précis* of political events and a catalogue of Dost Mahommed's descendants, there is no attempt to forecast the political barometer or to fix precisely the frontier at which Russia can best be held in check. But if any young soldier wishes to know what the occupation of a hostile territory is like and what form of hardships he may have to encounter, we can refer him confidently to this Diary; nor is it wanting in lively descriptions of the climate, habits, and temper of the people, and in materials for the administrator and the diplomatist.

Major Le Messurier is evidently an old campaigner, or, at any rate, he possesses the happy faculty of making the best of things and of getting on in spite of lame horses and departmental blunders and delays, where work has to be done or space to be traversed. As a member of a scientific corps he has an eye for gradients, curves, and the difficulties of road-making over plateaus swept by dust storms and in defiles liable to sudden inundations. And his invariable buoyancy of spirits lends an additional value to his observations. As might be expected by those who have studied the country, he endured most trying alternations of heat and cold. In the Bolan Pass, near a stream appropriately called the Dozdan, or "thieves' nullah," he shivered under a biting wind and water froze in his tent. His skin was chapped, and the natives of India failed to comprehend what it was that gashed and slit their hands. The last stage into Kandahar is described as a howling desert without a trace of vegetation. The climate was then bitterly cold, but invigorating; everything seemed to sparkle with electricity, and every one's appetite was always ready for any meal. In Kandahar itself the thermometer varied in January from 57° to 27° in two or three days. There was snow on the hills, and the wind shifted capriciously, or occasionally dropped and brought on unseasonable heat. But all this was nothing to the summer. Flies came in swarms; columns of dust swept through the camp, especially in the Khojak Pass; and, in spite of sanitary precautions, fever and cholera broke out. Yet the men, Europeans and natives, and horses and ponies, somehow managed to stand the temperature. Not so the camels. These useful animals devoured prickly bushes, and occasionally died from eating poisonous shrubs. If an experienced Shikari called Biluch is to be trusted, the Government officials put too heavy loads on the camels' backs. They should have been given lighter burdens and warmer clothing, and bad grazing would not then "have broken their hearts." But, as this sententious old hunter said, the Sirkar (Government) "does everything at the wrong time." Major Le Messurier gives us some trustworthy statistics of the numbers of troops, camp followers, horses, mules and bullocks, and stores that were forwarded by special trains on the Scinde, Punjab, and Delhi Railway, during these troublous times. It needs neither extraordinary aptitude for finance nor elaborate budgets, but ordinary judgment, to be quite certain that a war depending on the transport of such vast material could never be concluded for a paltry three millions sterling. Such figures as the following might have opened the eyes of the humblest clerk or the most complacent civilian:—

Troops and followers	190,000
Horses and mules	24,000
Bullocks	8,000
Camels	1,000
Stores	1,400,000 maunds.

This was on the line of railway in the space of eight months. Later on, in 1879, after the murder of the escort, similar energy was displayed for ten days, though the figures do not of course rise so high. And this was independent of additions sent from Bombay direct. We observe that the author, while describing these arrangements, prefers the system of regimental carriage to what is termed the consolidated system in force with English and Continental armies. He argues that in the late campaigns whole regiments were constantly ahead of their Commissariat, and would have fared better had the commanding officers of each corps been allowed to provide for their own wants.

Leaving this knotty question to be decided by experts, we turn to some of the episodes in the Diary which diversified the hardship and monotony of camp life. The city, and especially the Shah bazaar, had been immensely improved by the efforts of our officers; rubbish carted away, spaces cleared, drains purified and trade encouraged. Blacksmiths manufactured spades, knives, horse-shoes, and cooking pots, with iron imported from Bombay. Coppersmiths were no less busy, and displayed, besides articles of indigenous manufacture, the Russian samovar. Leather curriers and tailors drove a brisk trade, and the *postin* or large Afghan coat that comes down to the heels was procurable for about 10*l*. This seems a large sum to give, and, it may be, was fixed to suit the Englishman, but an Afghan would probably pay less and wear the article down to rags. Shoes ranged from 1*s*. 8*d*. to 9*s*. 6*d*. a pair, and the close-fitting quilted caps worn by the lower orders cost about twopence-halfpenny. For a prayer-carpet the price asked from the author was ten rupees, though a true believer might have had it for seven. The description of the manufacture of floor-cloths out of felt, in coloured patterns, is extremely curious, but too minute for us to quote or analyse. Brickmaking, on the other hand, is extremely simple. Two men can turn out, from a trench supplied with running water, nearly 1,500 bricks a day. They are dried in the sun, and not burnt. But the account of baking bread and making *kabābs* is truly inviting, and the process is distinguished, we are told, by a neatness and cleanliness for which we should look in vain in the bazaars of Calcutta or Cairo. Five men divide the labour of kneading the dough, dabbing it in pats on a board, rolling out and ornamenting and finally affixing them to the inside of the sloping roof of the oven. The *kabābs* are made as follows: to minced meat is added the fat of the *dumba* or heavy-tailed sheep, and the two are neatly skewered, with the addition of spice, salt, and onions. We are gratified to learn that the author and a friend had an enjoyable meal on these delicacies, which cost them little more than twopence. Similar praise cannot be given to the mode of shoeing horses, which sounds unscientific, haphazard, and barbarous. These walks through the bazaars, with, it must be admitted, the chance of a stab from some zealous Mohammedan, were varied by a day out with a hospitable native gentleman. Once the author joined a garden-party at a place prettily laid out—extent, forty acres; vines in trenches; avenues of rose-trees; an orchard; and plots devoted to lucerne and barley. There was a square house on this property, of two stories, with galleries and *tahkhanas* or rooms underground, in which the owners live during the hottest days of the year. Another day was spent, at the invitation of a Kazi, at the shrine of a real saint. The tomb was of various coloured stones, with a headstone of black marble, inscribed with Arabic characters. Round the enclosure were hung horseshoes and the horns of the ibex and the *markhor*, not killed in the chase but picked up on the hillsides. An excellent *déjeuner à la fourchette* was served in a large tent, at which stews, pilaos, *kabābs*, sweetmeats, and pickles succeeded each other. The attendants and the crowd had no hesitation, we gather, in disposing of the remnants of the feast. The Kazi, besides being learned in his own classical languages, was proficient in modern history and geography; had relations who wrote about Napoleon and knew the four great continents of the world, but did not think much of Australasia. We daresay they had also their own ideas about Russian advancement, if they could have been induced to open their minds. The necessity of taking an armed escort on shooting parties reminds us that sport in Afghanistan is not as simple a matter as our officers have found it in Besika Bay or on the plains of Troy. It reads more like a risky adventure in Greece or Sicily. Sappers watched the ponies and the shooters, while the sportsmen themselves waded into tanks and across irrigation canals—places, the author insinuates, hateful to dirty Afghans, who never apply water to their persons. The bags, however, were not large. Snipe were wild and ducks wary, and partridges not abundant. The Afghans net quails in large numbers, and, as we have read in Lieutenant Wood's *Journey to the Sources of the Oxus*, regularly ride down pheasants and partridges at particular seasons of the year. It is characteristic of the English officer on a campaign that, while Viceroys and Councils are still debating about advance, retirement, or retention of what we have got, he has already put together his breechloader, levelled a space for cricket, laid out a course for a steeplechase, including probably a water-jump, and amazed the natives by a spirited game of polo. Fruit, by itself, will not make up a Budget nor pay a dividend on a railway; but in Afghanistan it was to be had in abundance. An excellent imitation of gooseberry fool was made out of green plums; of grapes there were at least fourteen or fifteen varieties; and peaches and apricots were so plentiful that we are only thankful there was not more cholera.

Major Le Messurier has some excellent suggestions about kit, dress, and the bivouac generally. He had to be prepared for extremes. Boots with canvas tops, brown suits, and helmets with spikes and chin-straps of leather, sound very well for rough work. Two suits of clothes, with four sets of underclothing, ought to suffice for any man, says our author, until they are worn out. Flannel should be invariably worn next the skin, as most Anglo-Indians will admit; and when the campaigner reaches his small tent in some defile which might compare with Wuthering Heights for wind and bluster, he takes down his saddle-bags from the camel, puts on a *banian* (*Anglicè*, a jersey), and tops this by an ulster and a pair of felt leggings, and then is quite ready for dinner. His bed is a "sack of felt, with a waterproof sheet underneath, blankets, and ulster above." But even with all this he could not have kept warm, had it not been for the thoughtfulness of his wife, who had stored away in his baggage an india-rubber hot-water bottle. To use his own unadorned and expressive language, this article excelled all comforts that any poor shivering devil ever had, warmed

his feet at night, made him *khush* (happy) in his mind, and gave him hot water when he turned out to renew his march next morning. The details of the equipment and allowances for officers, privates, and camp followers will be found of practical use for all similar expeditions; and the heights and distances of the Thull Chotiali route, procured from General Biddulph's corps, are all so many contributions to an accurate and "scientific" knowledge of our frontier. Taking this record for what it really pretends to be, we have very little to criticize or deprecate—save perhaps the practice of sporting on Sundays, which, we can assure the author, if winked at by Englishmen, will not gain him respect in the eyes of the natives, who know that the English official is wont to set aside certain times and seasons for rest and *Pooja*, and to read the service at Stations when there is no chaplain. But, in every other respect, this Diary is a credit to the soldier, the sportsman, and the engineer.

FORMBY'S ANCIENT ROME.*

MR. FORMBY has given to the world an exceedingly sumptuous volume; but for all except those who are willing to embark in the same boat with him, or have made the venture already, he has rendered it impossible to do more than express their admiration of its typographical and artistic beauty. It abounds with illustrations of objects of almost every kind which may throw light on the history of the city from its first beginnings, and more especially of those which belong to the province of Christian antiquities. But from no portion of the text will readers moderately acquainted with the subject gain much addition to their knowledge. They will find something in Mr. Formby's text about the walls and fortifications of the city, something about the tombs on the Appian Way, and something more about the catacombs and some recent discoveries in them, the discovery of the chair of St. Peter in the Ostorian cemetery being apparently the most important of all. But they will soon see that Mr. Formby's zeal refuses to be bounded by the limits of the historian's office, and that the results of historical research have for him no value unless they support a particular conclusion. Of course we do not suppose that he has at any time distinctly made up his mind to reject facts if they fail to square with theory; but his conviction of the truth of his own belief is so absolute that he is spared the pain of discerning in history anything which may disturb the serenity of his assurance, far less anything which may suggest doubt. We have a sketch of the fortunes of the Roman city and State from the days of Romulus downwards; we have some account of the Punic wars, of the internal struggles which led to the downfall of the Republic, of the Greek schools of philosophy and their influence on Christian thought, and a much more detailed account of Roman imperialism and of the imperialism of the Popes who took the place of the Emperors. But from beginning to end every fact is made to point to one conclusion, and this conclusion is to be received as coming with the full weight of Divine authority. To whatever part of the book we may turn, there is no escape from the iteration of the one great lesson which universal history teaches to Mr. Formby; and so thoroughly is he absorbed by its paramount importance that he neither feels wearied himself by repetitions which to others must be intolerably oppressive, nor thinks that any one can be found to shrink from the toil of wading through pages the writing of which has afforded him unmingled pleasure.

Unfortunately this conclusion involves a mass of propositions which Englishmen generally have definitively rejected. The English nation does not look on itself as bound by allegiance to the Holy See; it does not look on the Roman pontiff as by Divine appointment the absolute lord and master of the whole Christian world, whose imperial power is the only safeguard against an anarchy which, without this check, would sweep everything away. But, although we have come to tolerably definite conclusions on these points, it may safely be said that there are few Englishmen who would care to complain of Mr. Formby for upholding the most rigid Ultramontanism, so long as he does not impugn the independence and sovereignty of the English State. He is quite free to assert that the Roman Church is the mother and mistress of all Churches, so long as he does not assert that her decisions may override the authority of English law within the limits of the realm. But Englishmen are not merely Englishmen; many of them are historical students and scholars also. For many generations English writers have, with greater or less care and ability, dealt with the history of Rome, and the subject has attracted during the present century the special attention, not only of German sceptics like Niebuhr and Mommsen, Curtius and Schwegler, of whom Mr. Formby has a righteous horror, but of English scholars whose honesty and learning cannot be called in question. The history of Rome, however, cannot be separated from other history. There is but one method which must be applied to the records of all times and countries; and this method has yielded certain results as to which historical scholars in this country and on the Continent are generally agreed. In England and Scotland, and not in these countries only, there is a general impression that the claims of the Roman See to unconditional authority were deliberately and definitively rejected a few centuries ago, that the English nation broke with the Pope as completely as one people or power can break with another, and that this alienation, or revolt, or rebellion (the name is a matter of indifference), was not confined to the bounds of Great Britain. Englishmen therefore can scarcely hear without some feeling of surprise, or indeed without a slight incredulity, that no such events have ever occurred, and that in the eyes of the staunchest upholders of the Papal claims such incidents are regarded as mere possibilities of the distant future. As a citizen both of Arpinum and of Rome, Cicero spoke of his attachment to his native place as an affection which must be subordinated to the attachment which he felt for Rome.

> If then [adds Mr. Formby] it should ever come to pass in the disorder of human things that a Christian nation should be betrayed into breaking its ties of allegiance to Christian Rome, which has been divinely constituted the one supreme centre of Christian unity for the nations of the earth, and if this fatal act should prove the inevitable rupture of the previously subsisting concord between the lesser patriotism which is by nature, and the higher allegiance to the centre of unity which is Christian and divine, the words of Cicero are plainly seen to stand good for the higher claim.

The argument of Mr. Formby's lumbering sentences may be left on one side. It may be right that Englishmen should be Ultramontanes first and Englishmen afterwards; but it is puzzling to be told that certain things which have happened long ago may perhaps happen for the first time hereafter, and that claims which have been disputed or rejected by the largest part of Christendom have been formally denied nowhere. For those, however, who may have the patience to read a few of Mr. Formby's chapters consecutively, the feeling of puzzlement and surprise will soon pass away. They will see that history reveals to him quite another set of facts from those which it displays to Englishmen who fancy that they are not under the Roman obedience. To their unenlightened eyes the story of the Roman asylum in the legend of Romulus stands out in marked contradiction to the rest of the tale, and appears as a singularly unimportant incident in the traditions of a people whose fortunes were in no way affected by it. Not a few perhaps may doubt whether it was a Roman tradition at all. It is certain that during the time of the Republic the Romans were practically unacquainted with the Greek custom of taking sanctuary. Hence those who made up the story had to borrow the Greek word; and we know pretty well who the makers of such stories were. But with Mr. Formby inconsistencies, improbabilities, and contradictions go for nothing; and for him the incident becomes the pivot of the history, not of Rome only, but of the whole world. The opening of this refuge for vagrants and criminals is, in his eyes, an event in which the finger of God is pre-eminently seen; and the character of the Roman State and people throughout their history is read by him in accordance with his interpretation of it with marvellous and unwearied persistency. In the story as given by Livy the incident of the asylum stands wholly by itself. It is never mentioned again, nor can it be reconciled with any part of his subsequent narrative, any more than it can be brought into harmony with the tale of the colonization from Alba. It is utterly inconsistent with all that is known of every other old Italian community; and all that can be said is that one passing phrase of Livy lends some slight countenance to Mr. Formby's notion that

> Romulus established his city as an asylum for the benefit of all who in various ways have made shipwreck of their fortunes and need a second chance to rehabilitate themselves in a new social order, in which no inquiries will be made into their questionable antecedents or doubtful previous character.

But, having mentioned this, Livy, writing after a supposed interval of seven centuries from this period of his history, goes on to tell us of a society as narrow, as close, and as exclusive as that of the haughtiest of Eupatrids in any Greek community. The Roman State, as described by him, consisted, in the very lifetime of its founder, of patricians who almost felt the touch of a plebeian to be a profanation; and these patricians belonged to tribes, houses, and families, in the religious rites of which none but hereditary members could possibly be allowed to share. With plebeians there could be no intermarriage, and for them there could be no admission into public offices, because all these were connected with religion, and to allow plebeians to fill them would be sacrilege. It is to the last degree unlikely that when the first Roman dwellings rose on the earlier Seven Hills, the country was swarming with vagrants; it is simply impossible that a society such as that which Livy describes could have immediately grown out of such materials, and could have presented that compact front and unbending attitude which belongs only to a social supremacy uncontested during a long series of generations. But for Mr. Formby's purpose it was indispensably necessary to assert that Rome from the beginning and continuously bestowed her citizenship on all who chose to present themselves for it. For those who have not his lights, the whole history of the Republic, whether trustworthy or not, is the history of a long and at times almost a desperate struggle on the part of the plebeians to fight their way to a share in the government which the patricians regarded as their own sacred and incommunicable privilege, these struggles being followed by bloody wars with the Italian States who wished that those privileges should be extended to themselves. Mr. Formby is beyond doubt right in saying that it was "distinctly contrary to the genius of all the other cities of the ancient world" for a city to open its gates freely "to strangers and newcomers." The whole traditional history which follows the passing mention of the Romulean asylum shows that it was in no degree more the distinctive characteristic of Rome. But the pre-Christian Rome must foreshadow the Rome of the Popes, and she is thus

* *Ancient Rome and its Connection with the Christian Religion.* By the Rev. Henry Formby. London: C. Kegan Paul & Co. 1880.

made to gather "her citizens from every quarter of the earth, whom she afterwards transformed into the Romans who conquered the world," although, apart from this solitary legend of a late age, there is not a tittle of evidence to show that she ever did so, or attempted to do so. This, however, in no way disturbs Mr. Formby. "Rome," he insists, "from the beginning, follows the diametrically opposite practice to all other cities, it being her rule to have no exclusive connexion whatever with any one nation or tribe of men; but always to keep her gates open for the reception of individual comers, and even of whole populations, without instituting the least inquiry into their nationality." Assuredly this conclusion is only less wonderful than the discovery that the English nation has never thrown off its allegiance to the Holy See. The objection lies not to Mr. Formby's ideas of the constitution of the Christian Church, but to the misreading and misrepresentation of facts. So far as he can support his own belief by analogies which can be adduced without doing violence to such evidence as we may possess, we have no right to impose any restrictions on his fancy. We have some information as to the relation of the clients at Rome to their patrons; but whether all, or only some, plebeians were clients, we cannot decide with any confidence. The institution may have worked well; in any case it may have helped to make the burden of subjection less intolerable. But it pleases Mr. Formby to think that "here as in so many other ways ancient Rome is seen to be the mirror of the Christian religion, in which the Christian people rejoice to be taught to regard their former fellow-citizens of earth, now saints of Heaven, as their patrons, and themselves as their clients"; and he has every right to any comfort which he may derive from the comparison.

If, again (the question of the trustworthiness of the narrative being put aside), the story of the times following the expulsion of the Tarquinian house from Rome teaches anything, it teaches us that a long and wretched struggle was needed before the Roman constitution assumed the form which it exhibited during the time of the wars with Carthage. To the patrician the admission of plebeians to a share in the work of government was the greatest of all conceivable organic changes. The attempts to bring about this change were resisted with an obstinacy and fierceness which showed that the patrician houses regarded the conflict as one for life or death; and the concessions wrung from them were, whenever it was possible, evaded, or left inoperative, or practically withdrawn. Nowhere, perhaps, was the struggle more virulent or protracted; nowhere was it accompanied with more deliberate injustice and more disingenuous subterfuge on the part of the nobles. With a wave of Mr. Formby's wand all these terrible controversies disappear. No sooner is the "life-monarchy" got rid of "than the city ceases to exhibit the least symptom of a desire for any further change." He cannot sufficiently praise the moderation and sound sense of the whole Roman people. "No sooner are the Tarquin family fairly ejected, than the city, become a republic, is seen to settle down at once to enjoy the substantial advantages of the firm and durable constitution established by Servius Tullus, sustained by the never-failing sagacity of the unbroken stream of capable statesmen." We can scarcely suppose that even a public school lad would win much credit by an essay which should maintain that, after the passing of the Petition of Right, all controversy between Charles I. and his subjects was at an end, that the rest of his reign exhibits a singular picture of harmony and concord between all orders of the realm, and that the King, dying in extreme old age, was quietly succeeded by his son, a sovereign as deservedly popular as himself. Mr. Formby's history is not a jot more credible. By what process he reaches his conclusions we cannot pretend to say; but he leaves us no option as to the mode in which they must be dealt with. The hallucinations which meet us in the first chapter run through it to the last; and we have only to say that, although the preparation of this splendid volume has doubtless been a labour of love, the book is historically worthless.

LISA LENA.*

"BASE is the slave that chronologizes," ought to be the motto of Mr. Jenkins's new novel. It is common for reviewers in their nasty cold-blooded fashion to find difficulties in adjusting the details of work which the novelist has thrown off in the flush of his genius. But we do not remember to have come across many books which outraged chronology quite to the extent of *Lisa Lena*. The heroine is the child of parents—very odd parents, too—who live somewhere in the neighbourhood of Mobile. Her father joins the Confederate armies and is killed. She herself, deserted by her mother, is apprenticed to a farmer when she is quite a small child. She then grows up to womanhood, or at least to full girlhood, and is fired with an ambition to join a circus. Among the members of the circus she joins is found no less a person than the redoubtable Mr. Heenan, the very same hero who afterwards had the famous fight with Tom Sayers. Now we had always imagined that that memorable combat took place some months before the outbreak of the American Civil War, so that apparently Miss Lisa Lena must have been living backward in some incomprehensible manner during the early years of her life.

Let it not, however, be for a moment supposed that this dull scholiastic criticism is the only kind of comment to which *Lisa Lena* exposes itself. It is much too remarkable a work for that. Generally speaking, Mr. Jenkins's novels have been of the strictest class of novels with a purpose. We are not quite able to make out what the purpose of this particular book is, unless it is to recommend the Dangerous Performances Bill which Mr. Jenkins, in days that are, alas! no more, and when yet Bills were matters within his competence, brought into the House of Commons. The *plaidoyer*, however, is by no means conclusive. Indeed, the second volume, which chiefly contains the life of Lisa Lena as a Living Cannon-ball, a Queen of the Caribees, and so forth, is a curiously incoherent and purposeless piece of work. It introduces us to some very bad company, and to some very queer company. The heroine, after being a model of propriety for some time, seems—we are not quite told how or why—to have become a model of impropriety, though we leave her comfortably installed as a deaconess. It must be admitted that some of the events of her life were agitating. Having become, not in too gratifying or romantic a fashion, the wife of an English clown, Mr. Benjamin Toddles, she finds herself pestered by her husband's employer, a fiend of the name of Boganio, and by a rich young New York *roué*, Mr. Vanderteufel. A highly interesting scene takes place in a New York hotel, in which Vanderteufel and Boganio appear and reappear very much like the classic figures in the weather-house. Lisa Lena disposes of the youthful Dutchman by pointing a revolver at him, but most imprudently abandons that weapon, which is in reality much more wanted against the aged sinner with the Italian termination. Finally both the lovers come to very bad ends, Boganio being not only ejected from a restaurant by a valiant tiger-tamer so that he has concussion of the brain, but also exposing himself to a charge of perjury, while Vanderteufel is killed by Lisa's husband in a fit of mistaken jealousy. Then we have some London scenes, in which Mr. Jenkins introduces a Lord Somebody, who talks about "a cwooked sawt of customaw," "nevaw mind," and so on. Mr. Jenkins was for several years a member of Parliament, and must have had the opportunity of hearing noblemen and gentlemen speak in public and private. Did he ever hear from any human being off the stage this absurd dialect which two or three generations of novelists and dramatists have perpetuated? We confess that we never did.

If *Lisa Lena* had consisted only of its second volume, it might have been dismissed as a dull piece of absurdity merely. If it had consisted only of its first, it would have taken very tolerable rank, at least among Mr. Jenkins's works. The childish experiences of Lisa Lena, or Elizabeth Bellamy, as for some mysterious reason she is called, though her parents' name is Mercer, are certainly painful experiences. Her earliest remembrance, with which the book opens, must have been more exciting than satisfactory. This earliest remembrance was of waking up and observing "a woman in her delicate white night dress, laced and frilled, leaning out over the sill of an open window, her hands clasped, her long black hair, a wealth of glossy beauty, floating down her shoulders, her white face, its fine profile distorted with anguish, marked like a marble relief on the black background of the night," &c., &c. The lady who made this striking tableau is the mother of Lisa Lena, and the reason of her excitement is that her husband is in the road below shooting freely at a crowd of citizens, who return the compliment with unusual want of address. Every now and then Mr. Mercer goes for the citizens with a bowie while his faithful negroes load for him, and altogether his conduct is such that after a short time we are not surprised to hear that the citizens desist from the unequal combat. When the war breaks out the lady with the distorted profile shows herself in some respects a worthy mate for this hero. She, too, shoots with freedom and lightness; and negroes who may be suspected of lukewarmness drop around her like the leaves on the strand. Regarded as a wife, however, she seems to fall a little short of the qualities expected in these cold climes. During her husband's absence some Southern troops come to the house, and one of the officers falls desperately in love with her. At their parting he throws his arms around her, and she, though like a well-conducted person she "disengages" herself, "kisses him on the cheek once." Soon afterwards the absent Mercer is killed in battle, which is perhaps lucky for him, and still luckier for the amorous officer. Thereupon Lisa's mother deserts her children, and, as we afterwards learn, goes to join the affectionate survivor. It is in consequence of this thoughtless act that Lisa Lena herself is transferred to the tender care of a Yankee farmer and his amiable wife, Mr. and Mrs. Mason. The torments which these good folks inflict upon their little white slave are described with some minuteness. The most original of them leads to what is also the most original thing in the book, a horse-and-dog fight. If Mr. Jenkins could introduce this on the circus boards, and if the Society for the Prevention of Cruelty to Animals did not interfere, the spectacle could not fail of an immense success. The fight comes about on this wise. The Masons have a fiendish horse, whom they appropriately, but perhaps for such pious folks irreverently, call Jeshurun. This amiable brute takes a special antipathy to Lisa Lena; and, when she has misbehaved, her master and mistress shut her up in the stable with Jeshurun for some time. Thereupon Jeshurun kicks, stamps, squeals, and evinces every desire to get at the child and treat her as though she was an appetizing wisp of hay, of course to her great terror. Providentially, however, there is another evil beast on the farm who is her friend. This is a great mastiff named Dragon, who

* *Lisa Lena*. By Edward Jenkins. 2 vols. London: Sampson Low & Co. 1880.

constitutes himself Lisa's friend and protector, even to the point of flying at his master and mistress when they ill use her. The final Armageddon between Dragon and Jeshurun is an admirable imagination, though we think that an artist with Mr. Jenkins's powers of "word-painting" might have made almost more of it than he does make. Lisa has broken a coffee-pot, and has to be tormented somehow. So the Masons decide that she shall sleep in the stable. Dragon, her friend, is nowhere to be found, and the prospect is sufficiently awful. She is carried into the stable and left there. The horse begins "to lash out, to shake his halter, to bite with his teeth, to snarl and shriek"; but at the same moment Dragon, who has concealed himself in the stable, thrusts his head into Lisa's hand. For two hours the horse struggles at his fastenings, and at last gets loose, but Dragon pins his throat at once. The farmer comes to see what is the matter, opens the stable door, and the combatants rush out, knocking him down and trampling on him. Then they fight it out till both are done for, the horse by the dog's teeth, the dog by the horse's fore feet. The scene certainly deserves the attention of ambitious animal-painters.

We like Mr. Jenkins's horse-and-dog fight much better than the fight which the unlucky Lisa Lena, who is a very Helen in her power of stirring up dissension, causes in her next "place." Here two brothers quarrel about her with a similar result—that is to say, that she runs away. She is indeed always running away for one reason or another. In this earlier part of the book, as in the later, Mr. Jenkins indulges in didactic passages. The didactic passages of the later part are chiefly directed to the impropriety of composing those parts of ladies' dress which are not seen of chamois-leather, Mr. Jenkins having, to all appearance, penetrated very deeply into the mysteries of feminine apparel. The earlier volume, when it mounts the platform or the pulpit, chiefly busies itself with the impropriety of teaching children religion in a disagreeable way. There is an odd episode of an elder who endeavours to convert Lisa without much result, and indeed without the incident having anything particular to do with the rest of the story. A severe critic might indeed say that there is not much in any part of *Lisa Lena* which has much to do with any other part. A somewhat indulgent Frenchman once criticized *The Devil's Chain* as being *L'Assommoir Anglais*. It would be rather hard on Mr. Jenkins to accuse him of having written an English *Nana*, though there would be certain grounds for the accusation. It seems more likely that, having had his attention called to the subject of dangerous performances, it struck him that he would improve the occasion in his usual fashion. *Lisa Lena*, however, cannot be considered in any way a success. It is not quite absurd enough to laugh at, except now and then, and it is not interesting enough to read. Except the horse-and-dog fight, there is no one of those bright imaginations which have generally illuminated Mr. Jenkins's productions; and even that passage is not worked up with half the picturesqueness of, let us say, the tar and feathering in *Jobson's Enemies*. In parts it really seems as if Mr. Jenkins had made a collection of cuttings about circuses and women athletes, and had written this book to work them up. The mysterious apparition of Heenan is the only place in which we directly recognize any historical person; and, as the pugilist has nothing to do in the book that Smith or Brown might not have done, his appearance is not very intelligible. Scattered incidents, however, such as the trimming of a tiger's claws, are easily recognizable as old friends in the corners of newspapers. It is less pleasant to record the fact that Mr. Jenkins (or is it Miss Lisa Lena?) knew a Queen of the Caribbees who had all her teeth pulled out by the misadjustment of the apparatus by which she was to support a weight. She seems to have got over it, however; and perhaps the simultaneous drawing of all one's teeth (it is not said that she broke her jaw) could not be much more neatly or conveniently effected if there were occasion for it. On the whole, unless Mr. Jenkins has been privileged to put into literary form the actual experiences of some music-hall *Diva*, we do not quite see the *raison d'être* of *Lisa Lena*.

HENRY VENN.*

WHATEVER may be the shortcomings of this Memoir, the compilers cannot be charged with undue haste. Eight years have elapsed since Mr. Venn's death; the materials of his biography were from the first ready at hand; and we doubt not that a considerable number of expectant readers have been looking for the publication of this book. The hindrances which have delayed its issue are, the principal author informs us, of little concern to the public; and the fact that we are obliged to refer to Mr. Knight as the principal author witnesses to the inartistic structure of the book. It is, in fact, two books, each of which goes over much of the same ground. We have 140 pages of Memoir, written by his two sons; then we have 400 pages which profess to describe his "Secretariat"—which is, indeed, sufficiently done for all practical purposes in the previous Memoir; and we have an Appendix, also contributed by his sons, on African Commerce. There is, consequently, no attempt at unity in the book; but, in spite of these drawbacks, it has a limited interest even for the general reader, who will care little for the laudation of Evangelical principles or for the Church Missionary Society as the apotheosis of these principles—which, indeed, is the burden of the story from beginning to end.

To the general reader the sketch of Henry Venn's early days is a sketch of the doings and manner of life of the "Clapham Sect" in the first years of the nineteenth century. His father was rector of Clapham. The present parish church, then called the New Church, had been built a quarter of a century before to the order of the Vestry, who stipulated for "a strong church," and received that "hippogryph of art" which Lord Teignmouth, in a letter contributed to this volume, describes with contentment, and not without regret that "it has not been able altogether to escape the touch of the restorer inside." Amid all the calls which were made on a prominent clergyman of his school, the Rector of Clapham found it consistent with his parochial duties to take pupils. Thorntons and Barings, and other wealthy Evangelical parents, were glad to send their boys to receive their early education from the Rector of Clapham, who could hear their lessons only between 8 and 9 A.M., and left them to themselves in the schoolroom for the rest of the day. In 1813 Henry Venn was transferred to the care of Professor Farish, who lived near Cambridge; the following year he entered himself at Queen's College, and in 1818 graduated B.A. as nineteenth Wrangler. He found himself at once in the same atmosphere at Cambridge which he had breathed at Clapham. Simeon had nearly lived down opposition; he and his followers represented the only school which gave any prominence to religion. If a young man had aspirations higher than his fellows, he attended Trinity Church, and went to Simeon's rooms for his Friday evening classes. No other method of satisfying his religious aspirations was open to him. Undergraduate life must have been very dull in those days. Probably, if we knew more of it, we should find that it did not compare favourably with our own days, in which amusement has been magnified into a science. We are told (p. 17) that "there was no boating whatever in the modern sense of the term; no boat club existed till long after this date." To men who could not afford a horse, walking was the only available exercise, and took the shape of a hurried constitutional (always in cap and gown) after the 3 P.M. dinner, and before chapel at 5 or 6 P.M.

Ordained on his Fellowship in 1819, he had some difficulty in finding a curacy which would give him the pastoral work which he desired. His particular views and those of his friends and party did not commend him to incumbents who wanted a curate; he, too, was not easily to be satisfied in his choice of an incumbent. At length he found one to his mind in the person of the Vicar of St. Dunstan's-in-the-West, who spent half of the year in another benefice, and whose bad health rendered him at all times incapable of doing much work. Here, then, Venn had a population of six thousand souls, and among them he worked for nearly four years, visiting every house, but taking care to post the parish beadle at the door of houses of indifferent fame until he made his exit in safety, a precaution which we have never met with in any other records of parochial labour. From Fleet Street he was moved to an uninviting parish, Drypool near Hull, then in the gift of Wilberforce, and after six years, to his great delight, was presented to a vicarage in Islington. The next seven years are a record of parochial work and of broken health which led to his being absent for two whole years; and in 1841 he became the Secretary of the Church Missionary Society, an office which he filled until within a few weeks of his death in 1872.

With this event the interest in his biography is, for the general reader, at an end. Venn was essentially a partisan, and laboured with a single eye to party ends for the Society which was for practical purposes himself. The Church Missionary Society was founded in 1799 as a distinctly partisan organization, and its original character has been carefully maintained; indeed it seems to us to be the one partisan society or association against which Bishops' charges do not fulminate. Perhaps the fact that this Society has a gross income of some 200,000*l*. wins for it the abstention from criticism which is freely bestowed on less wealthy associations. This same large income is a puzzle to some persons who are not behind the scenes. The Evangelical party is admitted by its own members to be in a very decided minority; it lays very moderate claims to learning; and indeed, in the obvious lack of that talent, it is inclined to depreciate it in others, and to substitute for it, as altogether superior to critical acumen or powers of analysis or synthesis, the very indefinite endowment of "possessing the root of the matter." Low Church incumbents who still survive lament that they cannot get graduate curates who will accept the aphorisms of those whom they call the "Fathers of the Evangelical School"; and Simeon Trustees, and other patrons of the same way of thinking, admit that it is impossible adequately to fulfil the terms of their trusts by reason of the dearth of men who will swallow the whole Calvinistic system. The Clapham Sect has disappeared root and branch; in very few churches can we now hear the doctrines in which that sect trusted as the whole body of revealed truth; and yet the Church Missionary Society year by year has added to its income, and, presumably, to its influence. But the Church Missionary Society is the inner citadel, the last stronghold, of the descendants of the "Eclectic Society" of 1799. Its income is appealed to by Low Churchmen as the real test and gauge of the power of the Evangelical party; pew rents may melt away, churches may change hands and doctrines, other schools of thought may come

* *Memoir of the Rev. H. Venn.—The Missionary Secretariat of Henry Venn, B.D.* By the Rev. William Knight, Rector of Pitt Portion, Tiverton, and formerly Secretary of the C. M. S. With an Introductory Biographical Chapter and a Notice of West African Commerce by his Sons, the Rev. John Venn, M.A., and the Rev. Henry Venn. London: Longmans & Co. 1880.

to the front, criticism, whether patristic or neologian, may shake the faith even of those who were counted faithful—these are not portents seen and known of all men; but an increased income of the Church Missionary Society, proclaimed in the early days of each recurring May, by a titled President, to sympathetic crowds in Exeter Hall, is trumpeted throughout the Evangelical world, and accepted as evidence of the corresponding dominance of the Low Church school. Nay, more, to some zealous partisans the Church Missionary Society becomes an objective article of faith more real, more fruitful of intensest devotion, than any that is to be found in the generally received Christian symbols. The Bishop Designate of Liverpool, for example, declared a few weeks ago on the congenial boards of Exeter Hall that "he should tremble for the very Ark of God if anything were to go wrong in Salisbury Square."

At the head of such an association as this any but a thorough-going partisan would be out of place. Mr. Venn realized what would be expected of him, and threw himself into the work with glee. He was an astute, diplomatic man, always ready to draw up a lengthy memorandum on any subject, and in pious phraseology to claim for his Society the fullest liberty, and to assert, even to the verge of contradiction, its entire consistency as a Church Society. The fundamental law of the Society declares that "a friendly intercourse shall be maintained with other Protestant societies engaged in the same benevolent design." This was, so his biographer tells us, thoroughly congenial with Mr. Venn's spirit; he wished to send a special deputation to Ireland in the height of the revival of 1860 to secure some of the subjects of that emotional crusade for the foreign work of the Society; he was on terms of great intimacy with the officers of Dissenting organizations; he deprecated the appointment of a bishop for Madagascar out of deference to the objections of the Congregationalists, and because the Bishop was to be "sent out by the authorities of the Church under the Jerusalem Bishopric Act." The reason given is worth quoting in view of recent and notorious facts. Mr. Venn, in one of the lengthy memoranda which he had so great a facility in drafting, wrote (p. 342):—

> In the case of a colonial bishop the case (*sic*) is altogether different. The Society's missionaries are, as a matter of course, placed under any colonial bishop whom Her Majesty may appoint, and the Church Missionary Society has never hesitated to uphold his authority. But in the case of a bishop consecrated under the Jerusalem Act the law gives a discretion, and therefore lays upon the parties concerned the duty of exercising such discretion as to the desirableness of accepting his authority.

This was written in 1871. We believe that almost the foremost objection urged against the Bishop of Colombo during the recent dispute, which was a matter of public knowledge, was that his lordship, being appointed by Her Majesty, was not fitted to lead the work of missionaries to the heathen.

But, while thus professing sympathy with every phase of Protestant thought, Mr. Venn was careful to make known that the Society interpreted this principle in a very limited way. Thus (p. 181) he claimed that "the Society had resisted the temptation to assimilate its proceedings to the necessary latitude of a National and Endowed Church"; "the Canons and Usages of the Church and the decrees of Councils" are declared (p. 199) to be "too obscure and uncertain a rule for general guidance." In the days of the Indian Mutiny some zealous clergymen in Somersetshire established a Missionary Candidates' Association, and asked permission to send candidates for approval to Salisbury Square; but this was declined in a lengthy minute, the gist of which was that all candidates must be selected "according to the practice and principles of the Society." We have heard that a favourite test of soundness with the Society is the answer given to the question, "Was the baptism of Simon Magus accompanied by regeneration?" Another minute with the inevitable "H. V." appended, pledges the Society to take no cognizance of missionary meetings or sermons "where the object is not the independent support of the Church Missionary Society."

A Society nominally connected with the Established Church, but so thoroughly a law unto itself, must inevitably come into collision with bishops, especially when, claiming to be "the rallying-point for all who are zealous on the Lord's side," it finds itself related to bishops whom it places in another category. When it was founded there were only two colonial bishops, and these in America, which was outside its sphere of operations. It early came into collision even with Bishop Daniel Wilson of Calcutta, and from time to time similar contentions have arisen. We believe that the Committee have two or three such cases on hand at the present time. Strange to say, it finds its defence in the precedent of "the voluntary brotherhoods of the middle ages, the salt of the corrupt Christianity of that time" (p. 223). The Society avails itself of the Act of Parliament passed in 1819, by which the two Archbishops and the Bishop of London were empowered to ordain "for the colonies" without the usual title (an Act passed when there were only three bishops in the foreign dominions of the sovereign, and which might be well allowed by our prelates to fall into abeyance now that the colonial episcopate is everywhere established), and then thrusts the clergy thus ordained into colonial dioceses, applying to the bishops for license to them to minister in "the districts to which they have been assigned. This is done on the understanding that licences will not be refused, nor, when granted, be revocable, except for some assigned legal cause" (p. 209). Thus the bishops become the mere ministers of a dominant Committee in England, and episcopacy is reduced to a shadow.

In all these arrangements much astuteness has been displayed, and whatever credit attaches to such diplomacy is due to the subject of this memoir. Thus to his party he became a hero; his secretarial chair was called his "throne"; his biographer writes of him as "a prince and a great man in Israel." We should expect nothing less; but outsiders, taking a more dispassionate survey, will rate him less highly. They will mark his narrowness of view. His Life of Xavier, which engaged his leisure for fourteen years, showed how impossible it was for him to appreciate the labours of any but his own party. He declared that Roman missions serve a good purpose when in juxtaposition with Protestant missions, as affording a warning against a nominal Christianity; and this from a man who claimed to have made missionary work the study of his life, and who may be expected to have known something of the vigour and extent of the Roman Catholic missions in China. The biographers have thought well to devote 110 pages to the "Instructions to Missionaries at their Dismission," which the Committee of the Society are in the habit of delivering by the mouth of the secretary. There is in these addresses an assumption at once of absolute authority on the part of the Committee and of passive obedience on the part of the missionaries which strikes us as exaggerated and hollow. To those who know that each missionary has at least consented to his fixed destination, if he has not chosen it, there is something unreal in such a sentence as "You, Brother ——, are appointed to Sierra Leone"; and the phrase occurs, *mutatis mutandis*, again and again. But we must refrain from further criticism. The book is not altogether such a one as we are wont to read, and we cannot say that we are anxious to meet with others of the kind. To persons who can assimilate it it will appear to be brimming over with unction; for ourselves, we forbear to describe our sensations with more exactness.

PULLAN'S CHRISTIAN ARCHITECTURE.*

MANY as are the books on this subject, there appears to be room for one or two more. A man who thoroughly knows an art or a science can usually make himself interesting, even though he has nothing absolutely new to tell. Mr. Pullan's lectures are elementary in the sense that, knowing what he talks about, he is able to select what is necessary to make his meaning plain, and can leave out judiciously. Brevity has been studied rather than ornament—indeed some passages are a little too much like leaves from a note-book—but that is no fault in a book of this kind. First principles are carefully stated, exceptions and side issues being avoided. Thus Mr. Pullan in his first chapter, devoted to the rise of the Romanesque style, gives a simple yet complete outline of the history of the Basilica. When the Christians were first able to seek out public places of worship they were not minded to employ the temples already existing. The worship of idols had defiled them, while the arrangements for sacrifices and the darkness of the interior chambers unfitted them for the use of congregations. The courts of justice offered a better model. They were oblong, often divided into aisles by ranges of columns. The tribunal was at one end, in the form of a semicircular recess. This apse was, together with a portion of the hall in front of it, fenced or screened off. Nothing could be better fitted for Christian worship. There was an elevated platform for the altar; the due separation of the ecclesiastics from the laics was provided for by the *cancelli*; the separation of the men from the women, according to the custom then prevalent, by the division into nave and aisles. "There was a raised throne for the bishop, and lower seats for his presbyters—a crypt beneath for the bones of the martyrs—and a porch for the penitents." Thus does Mr. Pullan put the basilican theory into its most elementary form; and the few reflections which follow, though they may serve to impress the theory upon a student, really add nothing to it. As the cross, says Mr. Pullan, was exalted and changed from a badge of infamy into a sign of honour, so the hall of judgment, a hall like that in which Pilate sat, became the type of the Christian Church. In this way the Romanesque or corrupt Roman style arose. The columns used in the erection of religious basilicas were taken from the temples, and corresponded to each other in height alone. The exterior was plain, but the interior was made to glow with colour. There are no basilicas of the primitive period remaining which exhibit all the original features; but St. Paul's Without the Walls at Rome was only destroyed by fire in 1823. It was of the time of Theodosius, and extremely simple and complete. St. Peter's, the predecessor of the great church, was of the same character, but was removed in 1506. St. Clement's, in the same city, interesting as it is from its exhibition of early arrangements, has now been proved, by the irrefragable evidence of excavation, to stand upon the earlier basilica. At Trèves, on the Moselle, is an actual basilica converted to religious uses by, it is said, the Empress Helena. It was partially rebuilt in the beginning of the eleventh century, but retains its ancient features. The founding of Byzantium by Constantine gave a new departure to church-building, and the architects, who "had an affectionate recollection of the magnificent cupola of the Pantheon," endeavoured to imitate it. The dome of St. Sophia became "the progenitor of a numerous offspring, which the mosque of Omar at Jerusalem, the tombs of the Caliphs at Cairo, and the Kremlin at Moscow respectively represent." The present St. Sophia, however, is not the original of

* *Elementary Lectures on Christian Architecture.* By R. P. Pullan. London: Stanford. 1879.

Constantine, but a copy by Justinian, who exclaimed, when he saw the result of his orders, "I have outdone Solomon." To the same period and style belongs the church of San Vitale at Ravenna; and another Byzantine building in Italy is St. Mark's, Venice, which is still substantially what it was in the tenth century. Mr. Pullan, observing that St. Sophia has been altered and shorn of its beauty by the Mahometans, describes St. Mark's carefully, as a typical church in the Byzantine style.

So much has recently been written in what can only be called a rhetorical style about St. Mark's that Mr. Pullan's simple description is refreshing. In calling it, however, a mixture of mosque and cathedral, we wish he had not indulged in the "nice derangement of epitaphs" which led him to say that "in it we behold the 'contemplative dome' of the East, side by side with the aspiring pinnacle of the North." We may remind our readers, though the description may be a little trite, that the west end is low and broad. This end faces the Piazza, for St. Mark's, unlike many other churches in Venice, stands, in the English fashion, east and west. The five western doors lead into a long porch, extending the whole width of the building. Such a porch is not unknown in England—at Fountains, for example. Three doors lead into the nave from the porch. The plan consists of five squares arranged in the form of a Greek cross. Over each square is one of the five great domes. A screen divides the eastern arm or square from the nave, thus forming a chancel. The uneven pavement is tesselated in interlacing circles of agate and jasper; the monolithic columns are of porphyry and verde-antique; the roof throughout is of gold mosaic, covered with many coloured figures; yet with all this variety of hue there is no gaudiness. So little light is admitted through small arched windows in the upper part of the building that the contending tints are sobered and harmonized.

Mr. Pullan has a good deal to say about English church architecture in the present century. He sensibly remarks that, though the architects of the new Constantinople may be said to have been driven by the force of circumstances into the invention of what was practically a new style, "we cannot divest our minds of the recollection of what others have done before us; therefore most of our efforts at novelty result in buildings which have no distinctive character, but which are mixtures of all known styles." Accordingly he classes the efforts of modern church architects as either *Eclectic*, combining parts from each style; or "of the *New Light*," of those who would have a new style for our churches; or *Antiquarian*, of those who would faithfully copy old examples; or, lastly, the school of *Development*, consisting of those who, "taking a point of departure, would therefrom proceed to develop the architecture of the future." His own sympathies would appear to be with the last. "No one," he remarks, "who has not got the true feeling for Gothic ought to belong to it." The difficulty lies, of course, in the point taken for departure. Upon what principles, he asks, did the old architects build? Pugin, on the one hand, thought the true plan lay in ornamenting the necessary construction. Mr. Ruskin, on the other, asserts ornament to be a principal part of good architecture. Some, too, say that symbolism was observed by mediæval architects. Mr. Pullan seems certain that the growing principle of ancient Gothic lay in the fact that the builder made the best use of the best materials. So far as this idea goes it is undoubtedly right; but Mr. Pullan shows that it may be pressed too far. Pointed arches were best where only small masses of stone, or still smaller bricks, could be obtained; but with large stones and with cast iron a different set of circumstances comes into play. He advocates a very restricted use of iron; and suggests that, if we are to use Gothic architecture, we should employ the ordinary building materials in an intelligent way, taking our departure, not from the first Pointed style, which was incomplete, nor from the fourth style, which was no improvement on the third, but from one of the intermediate stages. In the chapter on style and proportion in Gothic building Mr. Pullan develops a theory as to the use of triangles, as affording "governing lines" for a design; but the greater part of it is taken up with a condemnation of "Eclectic Gothic," and of the "hybrid Elizabethan, or that negation of style known by the name of another good queen." He is strongly opposed to anachronisms in design, and complains that too often in the same church you may find "lancet windows, plate tracery, and flowing tracery side by side; four centred arches and geometrical tracery," or the mouldings of all periods intermixed. With regard to proportion, Mr. Pullan observes with much force that, though many architects scout the idea of proportion in Gothic altogether, "we may be certain that there is no good architecture without good proportion."

In one serious matter we must find fault with Mr. Pullan's lectures. All through the volume we find a spirit of antagonism to amateur interference in architecture. "Surely those engaged in the practice of building ought to know the most about the principles of architecture." No doubt they ought; we all ought to do many good things that we leave undone, and to leave undone many things that we do. An architect ought to know something of art. He should have an eye to the picturesque. He should have an acquaintance with the great works of his predecessors. He should understand a little painting and a great deal of sculpture. Barristers and architects have this in common, that neither of them can know too much outside their own special province. But a survey of the buildings of, say, London would demonstrate two remarkable facts; one, that great architects, men of renown, do not always know style, proportion, picturesqueness, good building, or sculpture; and the other, that some of the best buildings we have were designed by amateurs. Sir Edmund Beckett pointed this out long ago. Indeed, if we mistake not, he calls even Inigo Jones an amateur. Sir Christopher Wren was one certainly. And among the writers on architecture whom Mr. Pullan most frequently cites and most implicitly believes in we find the names of Ruskin, Parker, Petit, Bloxham, Fergusson, Freeman, Webb, Glynn, Willis, Whewell, and Kerrich, all, if we mistake not, amateurs. He speaks of the possibilities of a purist school; and, mentioning the names of no fewer than seven great writers on architecture, remarks that, had they combined for the advancement of correct art, "our churches, instead of being mixtures of all things rich and rare, would have been harmonious compositions, recalling the best productions of the Middle Ages." But all the seven names are those, not of architects, but of clergymen, lawyers, college dons, publishers—anything, in fact, but the very men into whose mouths Mr. Pullan would put the question (p. 56):—"What are we about that we should find it necessary to be instructed by amateurs?" It may be that we mistake Mr. Pullan's meaning. If so, the fault must lie on his side, for undoubtedly the effect of his expressions is what we have described. Pugin, Mr. Street, and Sir Gilbert Scott are perhaps the only English architects whose writings can compare with amateur work. It is, indeed, a pity that the "purist school" for which Mr. Pullan longs was never established; but had the professionals listened to the amateurs, all would have gone well. It may not be too late. We have run, in the time of a single generation, through all the styles, from Edward I. to Queen Anne. If the architects have learnt wisdom from failure, now is the time for a new departure. Gothic, as Mr. Pullan observes, is our national style. It is capable of further development, not in a downward but an upward direction. We do not make the best of the materials in our hands as our ancestors did with what they had. We are willing to believe that there may be a bright future in store for a pure school of English architecture, though we see but comparatively few signs of it at the present hour of unrestrained eclecticism; but Mr. Pullan and all other architects may rest assured that they will not establish it by despising the freedom and independence in work which are the characteristics of the amateur.

JOHN DAVIS, THE NAVIGATOR.*

IT is nearly three hundred years since Queen Elizabeth granted her letters patent empowering Adrian Gilbert and others to find a passage "northwestward, northeastward, or northward," as best they could, "unto China and the Isles of Moluccas." Captain John Davis, one of these associates, made the first of his three North-western voyages in 1585. In the summer months of that and of the two following years, this skilful and intelligent Devonshire mariner sailed again and again up the Strait or Sound that still bears his name, leading to the Bay which was explored by William Baffin some thirty years later. The Hakluyt Society's collection of reprints is now enriched by a volume containing the original narratives of these early steps towards English maritime discovery in the Arctic regions, together with those of Davis's less famous adventures in the South Seas and the East Asiatic Archipelago, where he was killed; and with his writings upon subjects of geography, navigation, and seamanship. These papers, accompanied by Captain A. H. Markham with a suitable introduction and frequent explanatory notes, afford an interesting historical study.

One of the collateral disquisitions clears away several mistakes concerning the biography of this John Davis, of Sandridge, Stoke Gabriel, near Dartmouth. He has been confounded with a Captain John Davis of Limehouse, in the service of the East India Company, who was imprisoned by the Dutch in 1617, and who was also the author of a "rutter" or book of sailing directions. The error, begun in Prince's *Worthies of Devon*, was repeated by Dr. Kippis and Sir John Barrow, and latterly by Mr. J. A. Froude in *England's Forgotten Worthies*. The true Captain John Davis of North-west Passage exploration was a country neighbour of the Gilberts and their kinsman Raleigh, and their associate when they came to London. It was in January, 1583, that they were introduced to Walsingham, the Secretary of State, at the house of Dr. John Dee, the mathematician and astrologer, who had known them several years. "And so talk was begun of the Northwest Straights discovery," says Dr. Dee's journal of that date; and the very next day "we made Mr. Secretary privy of the N. W. passage, and all charts and rutters were agreed upon in general."

We get an incidental glimpse, here and there, of the characteristic excitement, caused by various motives, among the company of projectors. Adrian Gilbert, an enthusiastic idealist, petitions the Queen for licence to establish "the Collegiate of the Fellowship of New Navigations Atlantical and Septentrional." Dr. Dee was in favour with her Majesty, who one day rode through Mortlake and stopped to see him and Mr. Thomas Hudson, of the Muscovy Company, both of them dwelling there. A tenth part of the "gold and silver ore, pearls, jewels, and precious stones," which Adrian Gilbert was to fetch from the East Indies by his expected North-west Passage, would belong to Elizabeth. She and Secretary Walsingham had been led to consider also the great political and commercial advantages of the proposed exploit.

* *The Voyages and Works of John Davis, the Navigator.* Edited, with an Introduction and Notes, by Captain Albert Hastings Markham, R.N., F.R.G.S. Printed for the Hakluyt Society.

These are eloquently set forth in Davis's later writings. It would be "a deadly horror to her adversaries," for the Spaniard, who vaunted himself so great a monarch, and "Commander of both Indias," would be fairly cut out, and must "return to his old trade of figs, oranges, and oil." Davis says this in his dedication of *The Seaman's Secrets* to Lord Howard of Effingham, whom he neatly compliments upon his defeat of the "huge supposed invincible" Armada. He reminds the Lords of the Council, in his *World's Hydrographical Description*, that India would open a profitable market for English manufactures of woollen and linen cloth, fustians, seys, grograms, and other commodities, which too often "lie dead upon our hands." Above all, "there is no doubt but that we of England are predestinated to be sent unto these Gentiles in the sea, to those isles and famous kingdoms, there to preach the peace of the Lord." In the minds of English, as of Spanish and Portuguese maritime and colonial adventurers in that age, there was a mixture of religious with political ambition; "for are not we only set upon Mount Sion to give light to all the rest of the world?" It is a spirit readily allied to that of mercantile enterprise. Gilbert and Davis soon found a company of sufficient London capitalists, headed by William Sanderson of the Fishmongers' Company, who gave his niece in marriage to Sir Walter Raleigh, and who was "merchant for marine causes" to the Queen. The merchants of Exeter and Totnes, however, supplied a large share of the costs of Davis's second voyage.

The first voyage, from June to the end of September 1585, is related by John Janes, nephew and clerk to Mr. Sanderson, acting on board as supercargo. Davis commanded two small barques, one of fifty tons, the other of thirty-five—namely, the *Sunshine*, of London, with twenty-three persons on board, and the *Moonshine*, of Dartmouth, with nineteen, Captain Bruton in charge of the latter. Sailing from Dartmouth on June 7, they were delayed by contrary winds nearly three weeks at Falmouth and at "New Grymsbie in Sylley," but Captain Davis used the time wisely, making a survey and chart of the Scilly Isles. On July 19 or 20 they were amidst the floating ice off the south-east coast of Greenland. It seemed, at first, "the most deformed, rocky, and mountainous land" that ever they saw. Captain Davis therefore named it the Land of Desolation; but after getting round its southern shores, and passing up the inner westerly coast, to latitude 64 degrees 15 minutes, he found many green and pleasant isles, lying off Gilbert Sound, which is now called Godthaab. The sea here was "void of the pester of ice," which had rather alarmed his crew by the "irksome noise" it made; the air was temperate, and the country soon proved to be inhabited by a friendly race of people. These harmless Eskimos, allured by the playing of musicians who landed from the ships, came near to dance, and swore an eternal peace by pointing to the sun, beating their breasts, and shouting "Ilyaout!" The Englishmen admired their canoes, their dresses of sealskin and bird's skins with feathers, and their docile behaviour. Thence departing, and crossing what is known to us as Davis's Strait, new shores were reached, and waters to which the names of Exeter Sound and Totnes Roads were fondly given in remembrance of Devonshire. There also, to this day, Cape Walsingham bears record of the official patron of the enterprise; and "a very brave mount, the cliffs whereof were as orient as gold," is designated Mount Raleigh. We are reminded of Raleigh's fondness for splendid dress. Captain Davis, in this first trip, did not go beyond the 67th degree of north latitude, but turning southward found the entrance to Cumberland Gulf or inlet. Relics of fugitive Eskimos were picked up on the islands; among them was a sledge, and tame dogs were met, one with a collar about his neck. From the set of the tides and currents, and from the sight of whales beyond, the nautical geographer here thought himself near a great western sea.

It seems to have been always Davis's opinion that somewhere in those parts lay the most northerly coast of the great island of America, the Pacific Ocean shore trending up in that direction. His idea of its probable conformation may be understood by imagining the open sea to extend from near Vancouver Island to Hudson's Bay. If that were indeed the case, there would be a tolerably safe, easy, and commodious western passage for our traffic to China and the Asiatic Archipelago. The arguments upon which Davis relied are set forth in his *World's Hydrographical Description*. He lays much stress on the proofs of America being an island, which we now know that it is, but he could not be aware that it extends to above 73 degrees north latitude. He was misled also by the fabulous story told in a Spanish history of Mexico, that in 1540 Francisco Vasquez de Coronado, marching up the coast of California, met ships laden with merchandise, having their prows ornamented with gold and silver figures of birds like pelicans, which had sailed in thirty days, as he believed, from Asia. There was, besides, the fact mentioned by Cornelius Nepos, that, when Gaul was a Roman province, "certayne Indians, sayling out of India, were by tempest driven upon the coasts of Germany." It could not be supposed that they had come either round Africa, or round the north of Asia; "therefore it must needs be concluded that they came by the north parts of America." Such inferences and such evidence may provoke a smile; but Davis's conjecture of an immediate opening from the Atlantic into the Pacific was not at all unreasonable. He might well expect to find it either in Cumberland Gulf or Hudson's Strait; and if nature had so provided, the commercial and political value of the discovery to England in that age could not be overrated.

Davis himself is the historian of his second expedition, from May to September of 1586. He had a larger squadron to start with, but the *Mermaid*, his biggest ship, had to be sent home with invalids, and a small pinnace was lost in a storm. The *Sunshine* and the *Moonshine* also parted company, and no further geographical discovery was made; but some codfish were caught and salted, of which gifts were presented to Secretary Walsingham and Lord Treasurer Burleigh. In Davis's third voyage, that of 1587, with the ship *Elizabeth*, of Dartmouth, the *Sunshine* again, and a pinnace, he passed far within the Arctic Circle. He gave the name Hope Sanderson to a point of the interior or western Greenland coast, in 73 degrees north latitude. The ice in Baffin's Bay stopped further navigation; and Davis returned southward along the opposite shore, visiting Cumberland Gulf once more, Lumley's Inlet, and the entrance to Hudson's Bay, which was yet unknown. At the last mentioned place he found the sea in great agitation, from eight or nine successive furious currents, "races or overfalls, lothsomely crying like the rage of the waters under London Bridge," and pouring into the gulf. We quote from his own notes to his "traverse-book" or log-book.

The remaining contents of the volume before us, after taking account of what belongs to the history of Arctic or North-western discovery, have some interest as serving to illustrate the practices of seafaring life, and of rather unscrupulous traffic and warfare, in the Elizabethan age. We are led all round the globe in the company of some bold buccaneers, to see how the Spaniards and Portuguese, the English and the Dutch, were accustomed to dispute the opportunities of plundering "Indians," meaning every barbarous nation they approached by sea. John Davis held no chief command of the several expeditions here related, to the Azores, to South America and the South Pacific, and to Sumatra and the Straits of Malacca. His social position and character, in spite of Captain Markham's friendly attempts to explain away unfavourable contemporary allusions, cannot but appear to us rather shady. We are very willing, however, to acquit him of the base treachery of wilfully deserting Cavendish's expedition, in 1592, in the Straits of Magellan. The narrative of that disastrous expedition, by Admiral Cavendish himself, who died on the voyage home, may be compared with John Janes's pathetic account of what befel the *Desire*, the ship entrusted to Captain Davis, this statement being evidently prepared for his exculpation. Not less interesting, as an episode of our naval history, is Edward Wright's spirited description of the Earl of Cumberland's performances in the Azores, in 1589, with a squadron to which a vessel commanded by Davis was attached. But it does not appear that Davis's vessel was with the squadron in the homeward voyage, or shared the extreme distress of the other ships in the Bay of Biscay, the dreadful scarcity of water, and the strange experiences on the west coast of Ireland. There is a strong probability of his having served under the Earl of Essex in the attack on Cadiz in 1596; but he is next found as chief pilot in a Dutch mercantile voyage to the Malay principality of Acheen, the north part of Sumatra. Davis wrote the story of this adventure, which is here reprinted from Purchas's *Pilgrims*, and, though it seems highly coloured, is still worth reading. The two brothers Houtman were chief commanding officers of the *Lion* and *Lioness*; but one of them was slain, with a large number of his men, by a sudden and insidious attack from the Malays while feasting on board ship, and the other was taken captive. Both ships were then safely brought home to Holland by our brave countryman, who survived to encounter a similar tragic fate in 1605. He was fifty-five years of age when he thus met with his death, and was on his third voyage to the Straits of Malacca. His second, from February 1601 to September 1603, was in the capacity of "pilot major" to the *Red Dragon*, one of the English East India Company's first squadron of vessels under Captain Sir James Lancaster. The last voyage, which proved fatal to Davis, was made by him as pilot of the *Tiger*, a vessel fitted out by Sir Edward Michelborne, who personally commanded, as it appears, without regard to the East India Company's exclusive privileges. It is evident that Michelborne wrote the report given by Purchas which is here reprinted. A gang of Japanese pirates, whose vessel lay alongside the *Tiger* in a harbour not far from Singapore, were imprudently permitted to come aboard for hospitality. Michelborne says that Davis neglected to keep proper guard, or to remove their weapons; however that may have been, they attempted to seize the English ship, and in the fighting he and other men were killed. The claims of this active and ingenious navigator to rank among our true naval heroes may seem, after all, in some degree liable to question; but the documents connected with his memoir deserved the cost of reprinting them, and the pains which their editor has bestowed upon them.

An account will also be found here of the remarkable pair of globes, terrestrial and celestial, constructed by Emery Molyneux for Sanderson, which are kept in the Middle Temple Library. To the connoisseur of geographical antiquities there will be equal interest in the autotype facsimile of a map of the world attached to the three-volume folio edition of Hakluyt Voyages in the year 1600, upon which Mr. C. H. Coote offers some remarks. It is designed on the principle usually styled Mercator's Projection, but its author was probably the Edward Wright above-named, who was an accomplished mathematician, astronomer, and teacher of navigation. A biographical list and brief account of the men of science in this department, foreign and English, to the end of Elizabeth's reign, is supplied in an appendix to this volume.

Among these is Gerard Kauffman, or "Mercator," whose chart was published in 1569, but he did not make known the principle, which was left to be re-discovered by Edward Wright, and taught by him to Hondius the Dutch engraver. The Hakluyt map of 1600 is supposed to have been that noticed by Shakspeare, "the new map with the augmentation of the Indies," in Act iii., Scene 2, of *Twelfth Night*. It recorded the very latest geographical discoveries of that date, including not only Davis's Straits, but the coast of northern Novaya Zemlya visited by the Dutchman Barents in 1596. Perhaps the original draft of this map, as well as Molyneux's globe, was displayed in the Middle Temple Hall when *Twelfth Night* was acted there. It is suggested that a glance at its upper outline would show what Shakspeare alluded to:—"You are now sailed into the north of my lady's opinion, where you will hang like an icicle on a Dutchman's beard."

WHITE WINGS.*

MR. BLACK'S latest novel of yachting life is as unlike as it well can be to the one in which some two years ago he introduced his readers to ocean scenes. That book—*Macleod of Dare*—contained, it will be remembered, a somewhat daring introduction of incidents as romantic and thrilling as those of Bouchardy's melodramas into the surroundings amidst which they would be least expected. It is possible that the shortcomings which are to be found in Mr. Black's latest work may be due to the system of magazine publication, which, if it has some advantages, certainly has also many disadvantages both for writers and readers. We cannot speak from personal experience, for we always avoid reading books—books, at any rate, from which real enjoyment may be expected—in driblets; but it seems probable that while the effect of *White Wings*, as a whole, cannot be regarded as completely satisfactory, each part as it appeared in a magazine may have been very pleasant reading. At the interval of a month there would be little or no perception on the reader's part of the iteration which in the pages of a three-volume novel, read at one or two sittings, cannot but produce a somewhat wearisome effect. *White Wings* has, in fact, less resemblance to a novel in the ordinary sense of the word than it has to the books which used to be published under the heading of Diaries or Travels. There is, of course, a thread of story running through it, and there are some not ill-conceived sketches of character; but the real meaning and life of the book is found in the descriptions of things and scenes which the author's keen eye and memory have observed and retained. It is perhaps needless to say that many of these descriptions are vivid and charming; but, as we have hinted, when they are all gathered together and put before us in the guise of a three-volume novel, the good effect which they might have when presented singly is unavoidably diminished. The leading idea, or, in other words, the idea which enables the thread of story to run on through the three volumes, is a variant on the perhaps too familiar notion of the noble-minded girl who wishes to sacrifice herself for her lover's good, disregarding the facts that his idea of what is good for himself is that he should marry her, and that, if she has any glimmering of consistency, she ought to accept his ideas as better than hers. It is a well-recognized superstition, if not a fact, that women are apt to be inconsistent; but it may be doubted whether such instances of inconsistency and mistaken self-sacrifice as novelists love to exhibit are very frequent in real life.

In *White Wings* the hero for whom the mistaken self-sacrifice is made is a young doctor of extraordinary attainments, to which his conversation does not always do justice. When the love affair between the heroine and himself begins she is in possession of what is called a competence, and things go smoothly enough in his courtship, which is conducted on board a yacht in delightful weather. His duties call him away, and it is patent to everybody that nothing but the strongest feeling could induce him, devoted as he is to his profession, to give a promise of returning later on at the risk of losing time of special value. Meanwhile the girl's little fortune disappears, and he is met with coldness on her part when he returns. Apparently inexplicable changes in the behaviour of half-engaged people are certainly not uncommon, and such changes are often enough happily explained away, and traced either to an absurd mistake, or to the strange malignity of some third person, or possibly to some such notion of self-sacrifice as is employed in *White Wings*. Only it is not likely that such a girl as Miss Avon would be so silly as to practise this particular form of self-sacrifice with regard to such a man as Dr. Sutherland. She thinks that his career will be crippled or retarded if he marries a girl who has no money; and, on the other hand, she knows that he is desperately in love with her, and sees that he is made very unhappy by her amazing change of conduct, which it costs her much unhappiness to keep up. The difficulty is solved by the generosity of a pleasant old gentleman, who is half in love with Miss Avon himself, and who has been wholly bent on marrying her to his favourite nephew; but who, with a keenness which might not be expected from him, takes in the situation, and devotes himself to setting things right. In the treatment of this incident, and of the character of the old gentleman—the Laird of Denny-mains—Mr. Black makes up for a good deal of what may seem disappointing in the rest of his book.

It must, however, be remembered that if *White Wings* is disappointing as a novel, it is attractive as a book to take up and dip into. One can open it almost at random and get from it a sense of freshness and picturesqueness which, to people who have been enduring the heat of London, is pleasant, although the pleasure may not be unmixed with envy. The author's full and apparently spontaneous descriptions of scenery in this book are as accurate and as picturesque as any that he has ever written, and the subjects which he has chosen or fallen upon are some of the most beautiful that exist. We take at random one quotation:—

> Fairer and fairer grew the scene around us as the brave *White Dove* went breasting the heavy Atlantic rollers. Blue and white overhead; the hot sunlight doing its best to dry the dripping decks; Iona shining there over the smoother waters of the Sound; the sea breaking white, and spouting up in columns, as it dashed against the pale red promontories of the Ross of Mull. But then this stiff breeze had backed to the west; and there was many a long tack to be got over before we left behind the Atlantic swell and ran clear into the Sound. The evening was drawing on apace as we slowly and cautiously steered into the little creek of Polterriv. No sooner had the anchor rattled out than we heard the clear tinkling of Master Fred's bell; how on earth had he managed to cook dinner amid all that diving and rolling and pitching?
>
> And then, as we had hoped, it was a beautiful evening; and the long gig was got out, and shawls for the women-folk flung into the stern. The fishing did not claim our attention. Familiar as some of us were with the wonderful twilights of the north, which of us had ever seen anything more solemn, and still, and lovely than these colours of sea and shore? Half-past nine at night on the 8th of August; and still the west and north were flushed with a pale rose-red, behind the dark, rich olive-green of the shadowed Iona. But what was that to the magic world that lay before us as we returned to the yacht? Now the moon had arisen, and it seemed to be of a clear, lambent gold; and the cloudless heavens and the still sea were of a violet hue—not imaginatively, or relatively, but positively and literally violet. Then between the violet-coloured sky and the violet-coloured sea, a long line of rock, jet black as it appeared to us. That was all the picture: the yellow moon, the violet sky, the violet sea, the line of black rock. No doubt it was the intensity of the shadows along this line of rock that gave that extraordinary luminousness to the still heavens and the still sea.

It is also fair to repeat what has been said above, that some of the characters are well sketched—one can hardly say well drawn, for they are shown to us merely as passing figures, one phase of whose life is exhibited to us. It is only a practised hand that can make sketches of this kind; but if Mr. Black had been guided somewhat more by a purely artistic feeling he might have reflected that three volumes make up a heavy setting for such sketches. Some first-rate novelists have delighted in this kind of work, and as instances of this one naturally thinks of Mérimée, of M. Turguénieff, and of Mr. Henry James, who is, consciously or not, a successful disciple of both those distinguished writers. But neither of the three authors just named has tried the dangerous experiment of fitting their sketches to the Procrustean bed of the English circulating library.

In *White Wings*, John of Skye, the Laird of Denny-mains, and the Laird's nephew stand out as living characters. There is one capital scene in which the nephew, Howard Smith, and John of Skye, the skipper of the yacht, play principal parts. John is devoted to Dr. Sutherland, with whom he made his last cruise, and who to his other accomplishments adds a profound knowledge of seamanship. Therefore the substitution of Howard Smith for the doctor is not altogether pleasant in John's eyes. "Good morning, sir," he says at the gangway as Smith comes on board:—

> "Good morning, captain," the young man says lightly; and he springs too quickly up the steps, making a little bit of a stumble. This is not an auspicious omen.*
>
> Then on deck: the handsome figure and pleasant manner of this young man ought surely to prepossess people in his favour. What if his tightly-fitting garments and his patent-leather boots and white gaiters are not an orthodox yachting rig? John of Skye would not judge of a man by his costume. And if he does not seem quite at home—in this first look round—every one is not so familiar with boating life as Dr. Sutherland. It is true, an umbrella used as a walking-stick looks strange on board a yacht; and he need not have put it on the curved top of the companion, for it immediately rolls over into the scuppers. Nor does he seem to see the wickedness of placing a heavy bundle of canvases on the raised skylight of the ladies' cabin; does he want to start the glass?* Dr. Sutherland, now, would have given the men a hand in hauling up the gig. Dr. Sutherland would not have been in the way of the tiller, as the yacht is released from her moorings.

Just afterwards, when the skipper has relieved Miss Avon at the helm, he remarks to her suddenly, "Ay, ay, it is a great peety," and to her inquiry as to what he means, replies, "It iss a great peety that Mr. Sutherland not here, and he wass know so much about a yacht, and day after day not a breeze at ahl." Upon this Miss Avon blushes, and the unhappy Smith blunders deeply by mixing up Sutherland with a man of the same name who is entirely unlike him. Of these characters, however, one sees at once too little and too much, for the space which their adventures occupy. The book is, in fact, disproportioned. Many of its pages are charming as a record of yachting experience, and many others are attractive in that they contain some very pleasant and kindly observations of character; but the attempt to string the whole together by means of the not very brilliant love story of which we have spoken cannot be regarded as altogether fortunate.

---

* *White Wings; a Yachting Romance.* By William Black, Author of "The Strange Adventures of a Phaeton," "Green Pastures and Piccadilly," &c. 3 vols. London: Macmillan & Co. 1880.

NORTH AMERICAN ANTIQUITIES.*

MR. SHORT'S work on the ancient races, the prehistoric, pre-traditional civilizations of North America, has in some respects disappointed us. The subject is one of profound interest; the information collected is extensive, important, recent, and constantly increasing; and while as yet no definite conclusions respecting the origin and relations of the perished races of the New World have been or can be framed, each new work containing new facts, the records of further and later explorations, ought to furnish fresh guidance and new grounds at least for conjecture—ought at any rate to advance our general knowledge of the subject a few steps, to point to the direction in which the truth may be sought, and those in which all further inquiry is mere waste of time. Mr. Short has gathered together a quantity of valuable material, but has arranged it very badly; he has failed to distinguish properly between the prehistoric and merely monumental civilizations and those which, fading or flourishing, were still in existence at the period of the discovery and of the Spanish conquest, and has overloaded his work with a mass of speculation, absurd conjectures, and needless refutation. He has added something to the store of fact already gathered, but little or nothing towards the elucidation of the gravest, most difficult, and most profoundly interesting problems which the subject affords.

In Mexico and Central America at the time of the Spanish invasion there existed, we need hardly say, a great, powerful, well-organized empire, surrounded by the relics of more or less civilized nations, some of which had certainly, some probably, been broken in the course of ages by the growing strength of the Aztec monarchy. With these, however, we are not at present concerned. Mr. Short has told us much that is interesting, but little that is new upon this subject. It is clear that the Mexicans possessed and had long possessed a science, especially astronomical, which contrasts strangely with the barbarism of their religion and the practical defects of their social and political system. Their calendar especially, while very intricate and elaborate, was actually far superior to that then received in Europe, and accorded almost exactly with the true course of the seasons. The Mexican system rendered it possible to determine very exactly the dates of historical events as far back as their monumental records extended; and thus a people without an alphabet, and almost without a true system of writing, were able to preserve for ages materials which, but for the senseless vandalism of the conquerors, might have enabled the historic skill and archæological science of the present day to reconstruct their annals from the beginning. But the foundations of Aztec power had almost certainly been laid on the ruins of a previous scarcely less mighty, and perhaps not less elaborate, civilization, of which their records preserved but scanty and incidental notices. This prehistoric civilization, which occupies in the story of the New World something like the same place which that of Assyria or Egypt fills in that history of the Eastern hemisphere which antiquarian science is now labouring to reconstruct, may roughly be called Maya, by the name of the race to which its most striking and elaborate monuments, its best preserved remains, seem to have belonged. Enough of the language of this race can still be traced, partly from their monuments, partly in the dialects spoken long after the Spanish conquest by some broken tribes of Central America, to enable Mr. Short to present us with a translation of the Lord's Prayer into that almost forgotten tongue; for purposes of comparison with which he has given us the same document in the Aztec speech, showing, we think, that the languages, though widely different, belong to the same family. South America, again, had at least one civilization of its own, perhaps hardly less ancient, and yet more curious than that which, geographically so near, appears to have had little or no direct relation and no striking resemblance to it.

But by far the most interesting, and at the same time most bewildering and least intelligible, of the monumental civilizations of the New World is that of the race—apparently in some way more or less distantly related to the Mayas and their successors the Nahuas—which extended itself, it would appear, throughout the valleys of the Mississippi and the Ohio, and indeed over the greater part of what are now the Eastern United States. The grand primary and fundamental distinction between the monuments of Central and Northern America lies in their respective material. Like nearly all those monuments of the Old World which, buried for ages, are now being exhumed to throw light upon the thoughts and life of long-forgotten races, the dwellings, the temples, the cities, the fortifications of Mexico and the Isthmus are of stone, now and then intermingled with brick. Their builders had a peculiar arch and pyramid of their own. It seems at first sight difficult to conceive a civilization sufficiently strong, organized, and advanced to leave behind it monuments that have survived more than one tide of conquest and destruction, and yet apparently possessing neither the rudiments of the literary art nor the knowledge of iron, nor, it would almost seem, any skill in brick-making. It is the strange combination of power and knowledge shown in the construction of their monuments, with such ignorance of the arts by which elsewhere civilization has been created and protected and its monuments preserved, that gives such especial and unique interest to the relics of the great Mound-building race that once ranged over the greater part of the vast territory between the Mississippi and the mountains of the Atlantic seaboard. Bricks they had, for the most part sun-dried and moulded by hand. It may be conjectured that the burnt brick here and there discovered in the mounds has been hardened, not by fire directly and intentionally applied for the purpose, certainly not by the artificial baking of the individual bricks, but by the lighting for sacrificial or other purposes of great fires against the brick wall after its construction. But generally the mounds are constructed solely of earth; and their gigantic size, their elaborate and perfect arrangement, the wonderful mathematical skill displayed in the tracing of their outlines, and, above all, the extraordinary forms they often assume, render the character of the civilization which could achieve such marvellous feats, and yet was so deficient in much simpler and easier arts, perhaps the most curious of all archæological problems.

It is, of course, primarily to the nature of the soil they occupy that the peculiar character of these monuments must be ascribed. That soil, singularly wanting in rock or large stones upon or near the surface, no doubt primarily determined many of the most important conditions of social and political organization among the people that possessed it. It is clear that they needed fortifications; for they constructed defences so strong, displaying so much knowledge, ingenuity, and such an accumulation of spare human power, that the defeat, and apparently the extirpation, of the race that built and occupied them by enemies not civilized enough to have left any succeeding monuments of their own is utterly inexplicable. Great numbers of the mounds proper seem to have been constructed as foundations for towns and collections of dwellings more or less extensive; smaller ones served as watch-towers and beacon-stations; others probably to elevate temples, others to mark the burial-places of chiefs or princes; others, built with great accuracy in the form of animals, had no doubt some more or less superstitious purpose which at present it is hopeless to conjecture. One of these, in the shape of an elephant—a creature that has not existed in America for thousands of years—raises another and a very different question, a question enforced by the recent discovery of a pipe, if it be a pipe, carved yet more distinctly and unmistakably in the same form. The Mound-builders must have been an agricultural people, and their agriculture, since it could spare so many hands for non-productive labour, must have been of no mean character. The number and enormous size of their earthen works, together with the vastness of the region over which they range, from Northern Mexico far into Missouri, Illinois, and Ohio, seem to imply the existence of a great and united empire, probably of a powerful and well-organized despotism. A sort of subterranean chamber found in one of the minor mounds confirms the inference which the absence of stone and the rarity of brick suggests, that the buildings which must have crowned the elevated mounds and filled the interior of the fortified squares and circles were of wood, which throughout a great part of the territory of the race must have been as plentiful as other materials were rare. They were probably not addicted to navigation, since they seem to have penetrated and commanded the shores of the great lakes so far as to carry on a most elaborate process of copper-mining for many generations in security, and yet not to have extended their fortifications, or probably their habitations, so far northward. They had cloth woven with considerable dexterity by means of shuttles of stone, many of which are still preserved. They had pottery, often very graceful in outline, often reproducing—as did their earthen structures on a larger, and their carved stone emblems on a smaller, scale—the forms of animals and birds, sometimes, though more rarely, ornamented by some sort of graving tool. They certainly had copper, and seem to have had bronze; but nearly all the weapons and instruments preserved are of stone. Of pipes, or rather pipe-bowls, or what are supposed to be such, carved out of stone for the most part in the shape of animals, no small number have been found and are preserved in various local museums. Should it be confidently assumed that these are really pipe-bowls? Or may they not have served the purpose of those ancient small Etruscan and Latin lamps to which they bear no little resemblance? The forests that have overgrown the mounds, often of very great age, imply a long, unhappily a wholly undefined, interval between the disappearance of the builders and the discovery of their structures by civilized men. In one or two cases accumulations of earth above or around their foundations testify to a greater age than could be confidently inferred from the tree-growth above them. It may be observed, again, that the savage tribes who at the time of the discovery of America ranged over the entire region, once evidently occupied by a people who must have outnumbered their successors a hundred or a thousand-fold, retained no tradition of a preceding race conquered or driven southward by their fathers; not a single legend that even pretends to account for the existence of the marvellous monuments of human labour and power which they seem hardly to have noticed. One thing, at any rate, is almost certain: the Mound-builders had some relation—genealogical, historical, or commercial—with their neighbours to the southward. There exist between their earthen structures and the stone monuments of the Mayas and Nahuas resemblances which can hardly be accidental—which are in fact as close as could be expected among branches of the same race politically and geographically separated and obliged to use materials so utterly different.

The lately discovered remains of the cliff-dwellers and builders of the so-called stone pueblos in the central region of the Northern continent possess far less archæological value. The numerous very small chambers constructed in clefts or caverns of the rocks, often, strangely enough, at a great depth or height—either word seems equally applicable—in the vast walls of the cañons of the Colo-

* *The North Americans of Antiquity; their Origin, Migrations, and Type of Civilization Considered.* By John T. Short. New York: Harper & Brothers. London: Sampson Low & Co.

rado, were evidently the refuges of a feeble, endangered, oppressed race, seeking in almost inaccessible hiding-places safety from the malignant pursuit or cruel tyranny of enemies against whom they had no hope of contending. Now it is quite possible that these enemies may have been no other than the Spanish invaders, a view confirmed by one or two passages in Spanish records, in which case they have neither antiquarian nor historical value. Or they may have been the refuge of some weak remains of a race like the Mayas, from the fierce warriors of the Red Indian tribes, after the latter had become masters of all the habitable portions of the central and eastern regions north of the Rio Grande. There are, however, in the same region fortresses of a different character, refuges no doubt, since they are too small to have been intended as the regular dwelling-places of tribes numerous enough to have constructed them; towers of stone, sometimes encircled by a threefold wall, and capable, it would seem, of defence for an almost indefinite period against such enemies as the tribes which the white man found in possession. But as yet it seems impossible to form any conjecture as to their date, the history, or the connexions of their builders; and they are too few and too insignificant to possess any of that pathetic and profound interest which attaches to the remains of races so numerous, so powerful, so civilized, as must once have been the Mayas and the Mound-builders, which have yet perished so utterly, and left behind them no records but the structures which show that they must once have been great in peace and mighty in war.

GERMAN LITERATURE.

ANOTHER section is added to Professor Koerting's history of Italian Renaissance literature by an elaborate monograph on Boccaccio (1), the sequel to his previous biography of Petrarch. These two famous men may almost be said to constitute between them the Italian literature of the fourteenth century, and their mutual relations may be not unaptly compared to those of Johnson and Goldsmith. Petrarch is the literary dictator of the epoch, the man whose absolute supremacy no one in his own day dreamed of disputing, and who still remains the most characteristic representative of his age. Boccaccio, who would never even in thought have presumed to compare himself to his friend and master, is in truth the brighter as well as the livelier genius, and is to us the fresher and more interesting personage. He is, nevertheless, equally with Petrarch a type of the Renaissance, and it is in this point of view that Dr. Koerting, writing rather as a literary historian than as a biographer, principally considers him. He justly points out that classical and mediæval elements were harmonized by Boccaccio in such a manner as to afford a pattern to succeeding writers, and impart richness and variety to a literary movement which would otherwise have incurred great danger of pedantry and one-sidedness. The remark is of course applicable rather to the more ambitious compositions of Boccaccio than to the one which has chiefly immortalized his name. Dr. Koerting, whose estimate of his hero generally keeps on the safe side of enthusiasm, is particularly reserved in his treatment of the *Decameron*, whose freedoms he views in a more serious light than has usually been thought necessary by literary historians. The superiority of the *Decameron* to Boccaccio's other works is, indeed, not contested by him; but his sympathies are rather with the latter, especially with the *Fiammetta*, on the strength of which he claims for Boccaccio the creation of the modern novel. The romances of the ancients, he points out, depend chiefly upon a succession of incidents; it is in the *Fiammetta* that we first meet the analysis of feeling and the portraiture of character which make the charm of the modern novel. The *Filocopo* and *Teseide* are also very favourably treated; the story of Troilus and Cressida, as told in the *Filostrato*, approximates dangerously to burlesque, and Shakspeare has shown a more correct appreciation by treating it as a tragicomedy. It has not entered into Professor Koerting's plan, or been compatible with his limits, to discuss Boccaccio's influence upon other writers, especially Chaucer, who owes him so much, and the bent of whose genius is so strikingly like his own. The biographical part of the subject is very carefully treated, but not much can be added to what has hitherto been known. Boccaccio's countrymen would no doubt have transmitted his history more carefully if they had suspected his worth; but the full appreciation of the founder of a literature is, from the nature of the case, reserved for posterity. It is significant that the epitaph by Coluccio Salutati, evidently designed as a lofty panegyric, absolutely ignores Boccaccio's vernacular writings.

The second volume of A. Ebert's valuable history of mediæval literature (2) is devoted to the Carlovingian period, beginning with the revival of letters under Charles the Great, and continuing down to the death of Charles the Bald, a weak prince, but a patron of learning. In his zeal for literature, as well as in every other particular, Charles the Great showed himself immensely in advance of his age, and, although the visible fruits of his interference were small, the impulse which he communicated was never lost. It was beyond his power to create genius, and, tried by any elevated standard, the direct literary production evoked by him and his successors appears almost contemptible; but his formal recognition of the place which literature ought to occupy prevented the very conception of the literary character from perishing out of Latin Christendom. The only spots where letters flourished apart from his patronage were the Irish monasteries and their Continental offshoots, and it is a legitimate subject for congratulation that the only two writers of the period whose names have become illustrious—Alcuin and Joannes Scotus—belonged to these islands. The latter was undoubtedly a commanding genius, who would have ranked among the great teachers of mankind if he had lived at almost any other time. The annalists, hagiographers, and wretched poets with whom Herr Ebert has principally to deal would be most uninteresting but for their relation to the general history of culture. It is a marvel that his pages should be, as a whole, so spirited and readable.

Dr. Wieseler's investigations into the history of apostolic Christianity (3) are animated by a conservative spirit, and display fairness and moderation as well as learning. He confines himself to those parts of the New Testament whose genuineness is recognized by all, with the object of proving even from these that there is no foundation for the theory of a fundamental discrepancy between the teaching of St. Paul and that of St. Peter. In his treatment of the Apocalypse he is evidently, though no doubt unconsciously, influenced by an anxiety to make out John the Elder's title to the book, in order that the Fourth Gospel may be reserved for the Apostle. In the course of his argument he ascribes Chapter xxi. of the Gospel and the Second and Third Epistles to the Presbyter, notwithstanding the palpable difference between the style of these compositions and that of the Apocalypse.

Professor Overbeck's contributions to the New Testament Canon (4) consist for the present of two essays, one on the reception of the Epistle to the Hebrews as an apostolic writing, the other on the Muratorian Canon. He shows that the Epistle was for a long time as persistently rejected in the West as it was accepted in the East, and contends that its Pauline origin could only be admitted when the genuine Roman tradition of St. Paul's teaching had been lost. This moreover occurred about the time of the Arian controversy, upon which some passages in the Epistle were thought to have a bearing. In his essay on the Muratorian fragment Professor Overbeck disputes the opinion of Harnack, that it embodies the views of the Canon current early in the second century, and seems inclined to bring both its age and its authority down as low as possible.

Richard Lipsius (5) has added to his numerous investigations of the ecclesiastical legends of the early Christian centuries an examination of the curious cluster of tales which grew up in connexion with Abgarus, King of Edessa, who was supposed to have corresponded with Christ, and to have transmitted his portrait to posterity, and to have written to the Emperor Tiberius respecting him. The affinities of the legends of St. Veronica and of the Invention of the Cross to the same mythical cycle also form a subject of inquiry.

Schopenhauer (6) was thirty years without a disciple, almost without a reader. At present the mere list of the books and articles in which reference is made to him occupies ninety pages octavo of a special bibliography. Many of these references are slight or occasional, and in some other instances the connexion with Schopenhauer is very remote. After all deductions, however, enough remains to constitute a very remarkable proof of the power of genius to triumph over the hostility of cliques and coteries. The compiler has prefixed an introduction, in which he endeavours to improve upon Schopenhauer's pessimism, and to approve himself more logical and consistent than his master.

A society of German naturalists is turning the Darwinian theory (7) to account by an application of the principle of natural selection to the elucidation of some of the numerous problems still in need of solution in the various fields of physical inquiry. Our countryman Mr. Grant Allen's work on the colour sense has been translated for this series, and affords a fair example of its general character. Dr. Du Prel is probably premature in the application of the principle of the survival of the fittest to the solar system as a whole, and his essay, though interesting, contains little that is specifically Darwinian. Herr von Reichenau's investigations of the nests and eggs of birds are strictly biological. He rejects Mr. Darwin's theory of the cause of brilliant colour in birds, in favour of Mr. Wallace's, to which he makes some interesting additions. Dr. F. Schultze endeavours to deduce general laws of language from the observation of children's first attempts at speech.

Parts X. to XII. of T. Simons's richly illustrated work on Spain (8) complete the description of the capital, including an account of the national museum of pictures, with its wonderful treasures from the pencil of Velazquez. The remainder is devoted to Toledo, the most characteristically Castilian of Castilian

cities, and most perfect architectural monument of mediæval Spain. The railway has now deprived the journey to Toledo of its most picturesque features, but the city itself remains nearly unchanged.

The main purpose of Rudolph Westphal's (9) elaborate theory of musical rhythm is to show that the rhythm of Handel, Bach, Beethoven, and the other great modern masters corresponds in essentials with the precepts of classical musicians as conveyed in the treatise of Aristoxenus. As the canons of art are the same everywhere, this conclusion may be accepted as probable by readers unable to follow Herr Westphal's abstruse method of proof—an abstruseness due to no want of lucidity in the writer, but to the intricacy of the subject and the scantiness of material as far as classical music is concerned.

After all the interest excited by the Ober Ammergau Passion Play (10), it seems somewhat strange that it should be left to Herr Hartmann to publish for the first time the materials out of which the standard text of 1662 has been compounded. Even this latter, it appears, has not yet been fully edited; but Herr Hartmann gives sufficient extracts and notes to establish its derivation from two performances of earlier date—the Augsburg Passion Play formerly in the library of the monastery of St. Ulrich and St. Afra, now first published by Herr Hartmann from a manuscript written about the end of the fifteenth century; and another drama of the same nature by Sebastian Wild, printed along with other pieces at Augsburg in 1566. The existing representation at Ober Ammergau, as a regular performance, dates from a vow made by the inhabitants during a pestilence in 1633; but it is probable that similar exhibitions had previously taken place at irregular intervals.

With the exception of a short essay containing hints on the origin of language, T. Benfey's *Vedica und Linguistica* (11) consists of discussions of the niceties of Sanskrit grammar, intelligible only to advanced scholars, to whom the author's name will sufficiently recommend them.

Petzholdt's bibliography of the books and essays relating to Dante (12) since 1864 only is a fairly astounding proof of the critical and exegetical attention devoted to the poet, an attention greatly in excess of his actual popularity or real influence upon human thought. If, however, his circle is limited in comparison with Homer's or Shakspeare's, the sentiment he awakens is more intense, and a real student hardly seems to think he has done his duty by his author until he has earned a niche in Herr Petzholdt's bibliography.

It is no unusual thing for a newspaper to celebrate some special anniversary by the publication of a jubilee number; but the *Kölnische Zeitung* (13) affords the first example, so far as we remember, of a journal inditing its own autobiography. The occasion has been afforded by the present exhibition at Düsseldorf, to which the proprietors of the Prussian leading journal have very sensibly thought they could make no more appropriate contribution than a volume printed at their own press and embodying their own history. The result is a tall volume beautifully printed in bold Roman type, and accompanied by illustrations more commendable for accuracy of resemblance than for ease of execution. The paper, it appears, was established in 1802, had the honour of being twice suppressed by Napoleon, but reappeared in 1814, and has been published uninterruptedly ever since. It has always been in the same family, and its management has invariably displayed the prudence requisite to ensure its continued existence under hostile and suspicious Governments, no less than the energy that has given it a place in the first class of European journals. It has always managed to be ahead of its contemporaries, and, without incurring serious danger of suppression, has made itself a power with which the bureaucracy is obliged to reckon. At one time the late King of Prussia did not think it beneath him to threaten its existence in a Royal Speech; at another the editor was bribed to betray his principles; the absurd and galling interferences of the censorship were innumerable; but the paper has survived them all, and the freedom with which they are detailed proves, at all events, that liberty has made large advances in Germany since 1848. A considerable portion of the volume is naturally occupied with an account of the great mechanical improvements effected in the typographical department.

L. Anzengruber (14) has collected into two volumes the tales which have gained him a high reputation as a delineator of Austrian peasant life. They deserve their celebrity, being at once perfectly true to nature and redeemed from ultra-realism by extreme tenderness and a genuine spirit of humanity. With unaffected but unobtrusive compassion the author depicts the dark side of the peasant's spiritual existence—poverty and confusion of ideas and stunted or crippled intellect frequently co-existing with a fine moral nature, capable of acts of self-sacrificing heroism. Of this latter there is a fine example in "Pious Kate," where the heroine is indeed intellectually superior to most of Anzengruber's portraits. The danger of a lively imagination combined with ignorance and simplicity is powerfully shown in the pathetic tale of "Lizzie, the Goose Girl," who loses her reason on discovering that her favourite Virgin is, after all, but a wooden image. Every story has its strong point, and the whole collection shows that Anzengruber possesses a remarkable power of merging his own personality in that of his characters, and looking with their own eyes at the hard problem presented to them by life.

The "banished man" of Heinrich Kruse's tragedy (15) is Corfitz Ulfeld, whose adventures, and still more the protracted captivity of his heroic wife, constitute one of the most remarkable chapters ever inscribed in the romance of real life. History hardly affords a finer subject for tragic delineation than the splendid but mixed character of Ulfeld, a Danish Coriolanus misguided by passion and ambition into the one unpardonable sin of betraying his country, but, unlike Coriolanus, denied the opportunity of redeeming it. The chief fault of Kruse's drama is that Ulfeld is too favourably portrayed, and the tragic effect of mental conflict and self-accusation is proportionately weakened. The author has also sacrificed the contrast he might have obtained by the introduction of Ulfeld's triumphant rival—a better patriot, though a worse man—Hannibal Sehsted.

The *Rundschau* (16) opens with "Saint Barbara," an Italian noveletto by H. Hoffmann, too artificial perhaps in its simplicity, but pretty and artistic nevertheless. Hermann Grimm devotes an exhaustive investigation to Raffaelle's "School of Athens," especially to the question whether the celebrated philosophical figure introduced into it represents Aristotle, according to its first interpreter, Vasari, or St. Paul, according to its first engraver, Ghisi. He decides in favour of St. Paul, on artistic grounds which may be satisfactory, and on other grounds which seem to ascribe to Raffaelle more sympathy with the Reformation than he can well have had. The second part of Karl Hillebrand's excellent article on Belgium treats of the problems which Belgium has yet to solve—national defence, the encouragement of the old national language, and the reconciliation of Church and State. The essay is valuable as the testimony of an enlightened German publicist to the importance and vitality of a State frequently stigmatized as an artificial creation. A traveller from Japan gives some curious particulars of the Ainos, the primitive inhabitants of the northern islands of the Japanese archipelago. Their physical characteristics, it would appear, are by no means Mongolian, and their origin presents a problem of considerable difficulty. Herr Rodenberg contributes some lively sketches of Berlin life; and Mr. C. Grant endeavours to explain the secret of Mr. Carlyle's influence to the German public, who would have had more sympathy with him in the days of Fichte.

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,299, SEPTEMBER 18, 1880:

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

THE GUILDHALL SCHOOL of MUSIC, under the conduct and control of the Corporation of London.

Principal—Mr. J. H. WEIST HILL; assisted by eminent London Professors.

The above School will be OPENED on Monday, September 27, 1880, at 16 Aldermanbury, E.C. Further particulars may be obtained from Mr. CHARLES SMITH, Secretary, Finsbury Chambers, London Wall, E.C.

FRED. A. CATTY, *Hon. Secretary.*
CHARLES SMITH, *Secretary.*

Guildhall, September 1880.

ROYAL HISTORICAL SOCIETY.—By special permission of the Lords of the Committee of Council on Education, Dr. ZERFFI will deliver THIRTY LECTURES on "THE SCIENCE OF GENERAL HISTORY," in the Lecture Theatre, South Kensington Museum, on Saturday Afternoons, at Three o'clock, commencing October 16, 1880. A Prize of Ten Guineas will be awarded at the end of the Course for an Essay. For particulars and Fees apply to Dr. ZERFFI, 3 Warrington Gardens, Maida Hill, W.; or at the Catalogue Stall, South Kensington Museum.

SOCIAL SCIENCE CONGRESS, EDINBURGH, October 6 to 13.

President—The Right Hon. Lord REAY, D.C.L.

Presidents of Departments—1. Jurisprudence, The Right Hon. the LORD ADVOCATE—2. Education, The Right Hon. Lord BALFOUR OF BURLEIGH—3. Health, JOHN BEDDOE, Esq., M.D., F.R.S.—4. Economy, Sir UGHTRED J. KAY-SHUTTLEWORTH, Bart. 5. Art, Professor W. B. RICHMOND.

Information as to the Reading of Papers—which should be sent to the Assistant-Secretary on or before September 20—and other particulars, may be had at the Offices, 1 Adam Street, Adelphi, W.C., and City Chambers, Edinburgh.

J. L. CLIFFORD-SMITH, *Assistant-Secretary.*

1 Adam Street, W.C.

THE LONDON HOSPITAL and MEDICAL COLLEGE, Mile-end, E.—The SESSION 1880–81 will Commence on Friday, October 1, 1880.

Four Entrance Scholarships, value £60, £40, £30 and £20, will be offered for Competition at the end of September to new Students. Entries on or before September 20.

Fees for Lectures and Hospital Practice, 90 Guineas in one payment, or 100 Guineas in three instalments.

All Resident and other Hospital Appointments are free.

The Resident Appointments consist of Five House-Physicianships, Four House-Surgeoncies, One Accoucheurship; Two Dressers and Two Maternity Pupils also reside in the Hospital.

Special entries may be made for Medical and Surgical practice.

The London Hospital is now in direct communication by rail and tram with all parts of the Metropolis.

MUNRO SCOTT, *Warden.*

ROYAL SCHOOL of MINES. DEPARTMENT OF SCIENCE AND ART.

During the Thirtieth Session, 1880–81, which will commence on October 1, the following COURSES of LECTURES and PRACTICAL DEMONSTRATIONS will be given:

1. *Chemistry*—By E. Frankland, Ph.D., D.C.L., F.R.S.
2. *Biology*—By T. H. Huxley, LL.D., F.R.S.
3. *Mineralogy* } By Warington W. Smyth, M.A., F.R.S., *Chairman.*
4. *Mining* }
5. *Geology*—By John W. Judd, F.R.S.
6. *Applied Mechanics*—By T. M. Goodeve, M.A.
7. *Physics*—By Frederick Guthrie.
8. *Metallurgy*—By W. Chandler Roberts, F.R.S.
9. *Mechanical Drawing*—By Rev. J. H. Edgar, M.A.

The Lecture Fees for Students desirous of becoming Associates are £30 in one sum, on entrance, or two annual payments of £20, exclusive of the Laboratories.

Tickets to separate Courses of Lectures are issued at £3 and £4 each.

Officers in the Queen's Service, Her Majesty's Consuls, Acting Mining Agents and Managers, may obtain Tickets at reduced prices.

Science Teachers are also admitted to the Lectures at reduced fees.

For particulars (free), or for Official Prospectus (6d.; by post, 7d.), apply to the REGISTRAR, Royal School of Mines, Jermyn Street, London, S.W.

F. W. RUDLER, *Registrar.*

THE Misses A. & R. LEECH'S SCHOOL for LITTLE BOYS will RE-OPEN October 1, at 65 Kensington Gardens Square, Hyde Park, W.

AN ENGLISH LADY, of much experience in Travelling, who passed last Winter on the Nile, in charge of an Invalid, wishes to take Three or Four DELICATE GIRLS, whose health would be benefited by a warm climate, to Egypt for the ensuing Winter. Good references given and required.—For particulars, &c. address A. B., care of Colonel Yule, C.B., India Office.

LEAMINGTON COLLEGE.—ENTRANCE SCHOLARSHIP EXAMINATION, on September 14 and 15. Address, Rev. Dr. WOOD, College, Leamington; or, after August 1, Craigside, Felixstowe, Ipswich.

UPLANDS, SOUTH CLIFF, SCARBOROUGH.—A PREPARATORY SCHOOL, conducted by a married CLERGYMAN of twenty years' experience. Thorough grounding, individual teaching, and careful training. Constant supervision and home comforts.

TOURS, FRANCE.—Rev. C. DOWMAN, LL.B. (Mathematical Honours), receives PUPILS for Woolwich, Sandhurst, and Line *vid* Militia. At July Examinations Two Candidates for Woolwich passed qualifying Examination on high marks. Only Candidate for Sandhurst obtained 44th place, making 4,108 marks. Only Candidate for the August Sandhurst Preliminary passed. Address, Beau Séjour.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

REV. W. TUCKWELL, late Head-Master of Taunton College School, and Fellow of New College, Oxford, takes a few Boys as PUPILS. Preparation for the Civil Service and the Oxford and Cambridge Certificate.—Address, Stockton Rectory, near Rugby.

MR. H. B. COTTERILL (Class. Trip. Camb.), assisted by Mr. J. HALLAM (Math. Trip. Camb), and French and German Masters, has One or Two VACANCIES.—Address, 11 Liebig Strasse, Dresden.

ARMY, SANDHURST, WOOLWICH, MILITIA COMPETITIVE, UNIVERSITIES.—Messrs. ASKIN will be happy to forward (gratis) PROSPECTUSES of successful TUTORS. References kindly allowed to Chaplain-General to the Forces and others.—Address, 9A Sackville Street, W.

DELICATE BOYS (over Fourteen).—An experienced TUTOR, assisted by a French Gentleman, receives SIX PUPILS who require special attention, but only such as are willing to read and are worthy of trust.—Address, M.A., Oxon., Mill Bank House, near Malvern.

LITTLE BOYS.—The SONS of GENTLEMEN very carefully EDUCATED and Trained, from Seven years old and upwards, by a LADY of great experience.—Address, Mrs. CARMICHAEL, Belmont House, Blackheath, Kent.

BAR EXAMINATION and LONDON LL.B.—A BARRISTER (LL.B., B.A., London Honours) receives TWO PUPILS into his Chambers, to prepare for the above Examinations. Past Pupils have obtained Honours both at the 1st and 2nd (LL.B. and Scholarships) at the Inns of Court Examinations. Terms, Six Months, 50 Guineas; Twelve Months, 100 Guineas.—Address, LL.B., 1 St. Stephen's Church Villas, Uxbridge Road.

AN OXFORD GRADUATE, in high Mathematical Honours, Scholar of his College, wishes to meet with MASTERSHIP in Public School, or with PRIVATE TUTORSHIP (Travelling preferred). Science also if required.—Address, R. F., Box 123, Post Office, Wolverhampton.

TUITION.—A LADY wishes to be put in communication with TUTORS who prepare Boys for the Naval Cadet Examinations.—Apply to M., care of Currie & Co., Stationers, High Street, Dumfries.

A FRENCH LADY, Professor in a High School, desires to BOARD with a Family or School in return for Lessons and Conversation; neighbourhood of Victoria preferred.—Address, V. M., Verrinder's Library, 36 High Street, Kensington.

STATIONERS' SCHOOL, Bolt Court, Fleet Street.—Applications for the appointment of HEAD-MASTER (who will be required to enter on his duties the second week in January 1881) will be received at Stationers' Hall, on or before October 9, 1880, to be addressed in writing to the Master and Wardens, under cover to the Clerk of the Company. Candidates must be Members of the Established Church and Graduates of some University in Great Britain or Ireland, and must furnish Testimonials of experience in Tuition. Particulars of the duties and emoluments may be obtained at the Hall.

Stationers' Hall, Ludgate Hill: September 6, 1880.

CHAS. ROBERT RIVINGTON, *Clerk.*

ENGLAND to AUSTRALIA in FORTY DAYS. ORIENT LINE.

The following Royal Mail Steam Ships, belonging to the ORIENT and PACIFIC STEAM NAVIGATION COMPANIES, are despatched every FORTNIGHT for ADELAIDE (Semaphore), MELBOURNE, and SYDNEY direct, taking Passengers at through rates to all the principal ports in Australia, Tasmania, and New Zealand.

Ship	Tons.	H.P.	Ship	Tons.	H.P.
ACONCAGUA	4,107	600	LIGURIA	[illegible]	750
CHIMBORAZO	3,847	550	LUSITANIA	[illegible]	550
COTOPAXI	4,028	600	ORIENT	[illegible]	1,000
CUZCO	3,845	550	POTOSI	[illegible]	600
GARONNE	3,876	550	SORATA	[illegible]	600
JOHN ELDER	4,152	550			

The above Steamers have been specially fitted for carrying all classes of passengers through the Tropics on long voyages, and the passages hitherto made are the fastest on record.

For further particulars apply to the Managers of the Line, F. GREEN & CO., 13 Fenchurch Avenue, and ANDERSON, ANDERSON, & CO., 5 Fenchurch Avenue, London, E.C.

PENINSULAR and ORIENTAL STEAM NAVIGATION COMPANY.

UNDER CONTRACT FOR HER MAJESTY'S MAILS TO INDIA, CHINA, AUSTRALIA, &c.

REDUCED RATES OF PASSAGE MONEY.—SPECIAL RETURN TICKETS.

Weekly departure for .... Bombay.
Fortnightly departure for.............. Ceylon, Madras and Calcutta.
Fortnightly departure for.............. China and Japan.
Fortnightly departure for.............. Australia and New Zealand.

OFFICES: 122 LEADENHALL STREET, LONDON, E.C., and 25 COCKSPUR STREET, S.W.

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.

BENJN. BULL, *Manager.*

TOTLAND BAY, ISLE OF WIGHT, NEAR ALUM BAY.

TOTLAND BAY HOTEL.—Magnificent Sea Views. Comfort with moderate charges. Billiard-room and Tennis-lawn. Bracing air; excellent sands and promenade Pier. Good anchorage for yachts. Apply to Miss FLEMING, Manageress, late of the Langham Hotel.

THE ILFRACOMBE HOTEL is on the Sea Shore. It contains 250 Rooms, and is "a model of sanitary excellence." Table-d'hôte daily. Two Months' Tourist Tickets from all principal Railway Stations in England.—Full information of MANAGER. There is attached to the Hotel one of the largest Swimming Baths in England.

DENT'S WATCHES, CLOCKS, and CHRONOMETERS. Illustrated Catalogue sent free. Apply to 61 STRAND, or 34 ROYAL EXCHANGE, LONDON.

PORTUGAL.

No. 1,300, Vol. 50. September 25, 1880. [Registered for Transmission abroad.] Price 6d.

THE MINISTERIAL CRISIS IN FRANCE.

THE Ministry of M. DE FREYCINET has come to a sudden and unexpected end. On Friday of last week a Cabinet Council was held in which it was agreed, on the suggestion of M. DE FREYCINET, and with the approval of M. GRÉVY, that the decrees for the regulation of the religious orders should be executed in a cautious and tender way. This amounted to a general acceptance of M. DE FREYCINET'S policy. The basis of this policy was that the decrees should be kept hanging over the religious orders, but that the time and mode of executing them should be left uncertain, and should depend in a considerable measure on the conduct of the orders themselves. In return for their recent act of submission they were to be dealt with as gently as was possible. Everything seemed to have been pleasantly finished, and the PRESIDENT was ready to start the next morning for a shooting party with a light and cheerful heart. But on Friday evening the Minister of the Interior, M. CONSTANS, saw M. GAMBETTA, who had just arrived in Paris, and was told that this acquiescence in the policy of M. DE FREYCINET would never do, and that he must resign. M. CONSTANS did as he was bid, and the MINISTERS of JUSTICE and WAR followed his example. Another Cabinet Council was held on Saturday, and peace was again patched up after a fashion. The real point at issue was whether the religious orders were, in return for their submission, to have a temporary respite. M. DE FREYCINET had never said, and he never had any authority to say, that the submission of the orders would be taken as an equivalent for compliance with the law. But he had given it to be understood that, in consequence of this submission, the law should be temporarily in abeyance. In order to keep the Cabinet together, it was agreed that the MINISTER of the INTERIOR should be allowed to send a circular to the orders, in which he should state that, while he recognized with satisfaction the protestations of deference to the law and the Government which the orders had given, he must remind them that the law had not been complied with. Nothing was said in the circular which could be taken to imply that the decrees would be executed quickly or harshly. What was said in it was precisely what M. DE FREYCINET had been saying to the orders all along. It seemed, therefore, to him that he might honestly accept, as a means of keeping the Cabinet together, a formal repetition of his own language. But, although there was nothing contrary to his opinions in the circular, it was not in harmony with his policy that such a declaration should be made at such a moment. It seemed to be a threat addressed to those with whom he was endeavouring to be at peace, and whom he had promised to protect. The language of the circular was the language of M. DE FREYCINET; but the issuing of the circular was a concession on his part, and a departure from the policy he was supposed to have invented. It was, therefore, open to any one to say either that M. DE FREYCINET had done nothing, or that he had done very much. He might be treated as having held his ground or as having yielded. The MINISTER of the INTERIOR took the latter view, and despatched telegrams announcing that the PRESIDENT of the COUNCIL had capitulated. He claimed a victory for himself and those who a few hours before had retired with him. M. DE FREYCINET, finding himself thus treated with something like open contempt by a colleague, and having ascertained that it was too late to stop the announcement that had been made, resigned office; the MINISTERS of MARINE and COMMERCE resigned with him; and M. JULES FERRY was charged by the PRESIDENT with the formation of a new Ministry.

M. DE FREYCINET has been much praised for resigning with so much promptitude, and so much of praise is certainly due to him as is involved in his not choosing to pocket an open affront put on him by a subordinate. On the other hand, M. GAMBETTA has been much blamed for destroying the FREYCINET Ministry without taking office himself. But there has perhaps been a little excess both of praise and blame. M. DE FREYCINET has undoubtedly assumed an attitude of independence towards M. GAMBETTA. The Montauban speech was as nearly a challenge to M. GAMBETTA as it could decently have been. The views put forward at Montauban were very good views; but they were views opposed to the views of a strong section of the Cabinet, of M. GAMBETTA, and of the majority of the Chamber. M. DE FREYCINET was, after the Montauban speech, in the position of a man with very sensible opinions, but without political strength. He had nothing to lean upon except the good wishes of the PRESIDENT, and the chance that he might be left alone until he could bring a sufficient political following to think with him. Had he had any position such as in England we suppose a Prime Minister ought to have, he would not have resigned because a subordinate Minister triumphed over him, but would have invited the head of the State to dismiss the offender. M. DE FREYCINET could not take this course, because he knew that, if he did, directly the Chamber met he would be defeated. It would have been inexpressibly mean if he had pocketed the affront, and consented to endure a reign of dictation and insult; and this reproach he escaped by resigning; but he could not assert himself, because he had no means of asserting himself effectually. M. GAMBETTA upset the Ministry because, as a leader of the dominant party in the Chamber, he thought the Ministry was wrong. Some members of the Cabinet were more especially attached to this dominant party, and he told them to resign. They obeyed, and M. DE FREYCINET had then the opportunity of replacing them by friends of his own. He could not do this, as his new Ministry would have been dead almost before it was born. It is not, however, for upsetting the DE FREYCINET Ministry that M. GAMBETTA is blamed, so much as for not taking office himself when he had upset it; and a parallel has been drawn between Mr. GLADSTONE and M. GAMBETTA, much to the disadvantage of the latter. The two cases are really quite dissimilar. In France there really is a Constitution, although most foreigners seem never to have heard of it. Under this Constitution Ministers do not appoint themselves; it is the President who appoints them, and the PRESIDENT has never asked M. GAMBETTA to be a Minister. The real key to the situation in France is that the PRESIDENT is equally unwilling to employ M. GAMBETTA and to oppose him. The QUEEN first sent for Lord HARTINGTON, and he advised her to send for Mr. GLADSTONE. In much the same way the PRESIDENT asked M. JULES FERRY to become Prime Minister, and, unlike Lord HARTINGTON, M. FERRY at once accepted the office. The PRESIDENT did not call on M. GAMBETTA to take office. He passed him over, and asked some one else to form a Ministry who was willing to try the experiment. Rightly or wrongly, the PRESIDENT has come to the conclusion that he can carry on the government of the country better if M. GAMBETTA is not openly in power. The time may be very near when he will have to change his mind, and will

be forced to try the hazardous experiment of a GAMBETTA Ministry. But at present he thinks the time for this has not come. He prefers to employ the nominees of M. GAMBETTA rather than M. GAMBETTA himself. No doubt M. GAMBETTA has found his profit in this singular state of things, and no doubt he could at any moment force the hand of the PRESIDENT. If M. FERRY had been instructed to say that he would not take any office except under M. GAMBETTA, the PRESIDENT must have asked M. GAMBETTA to be Prime Minister. But so, on the other hand, the PRESIDENT could force the hand of M. GAMBETTA. He could have offered office to M. GAMBETTA when M. DE FREYCINET resigned, and thrown on M. GAMBETTA the responsibility of a refusal; or he could have offered to support M. DE FREYCINET by asking the Senate to permit a dissolution. He did neither of these things. He let M. GAMBETTA have his way, but would not let him have office. It must be supposed that M. GRÉVY takes this course, which for him personally is far from a dignified one, because he himself believes it to be the best course for France generally, and for the Republican party in particular.

M. JULES FERRY seems to have had great difficulty in filling up the vacant places at his disposal. He has got a new Minister of Commerce by the simple process of turning an Under-Secretary into a Secretary; but he does not think himself quite equal to the office of Foreign Secretary, which M. DE FREYCINET held in conjunction with that of President of the Council. A Foreign Secretary has accordingly been found in M. BARTHÉLEMY ST. HILAIRE, the *fidus Achates* of M. THIERS. As M. ST. HILAIRE is a professed admirer of Prince BISMARCK, the appointment may be considered as a sop to those who were alarmed by the Cherbourg speech. But admiration of Prince BISMARCK is not yet a passport to general popularity in France; and the extreme Republicans consider M. BARTHÉLEMY ST. HILAIRE as in some sort guilty of the repression of the Commune. There is a general impression that the Ministry is hardly to be called a Ministry at all, that it is a mere makeshift, and will disappear in a few weeks. Men who have any reputation to lose do not like to incur the ridicule of belonging to such a Ministry. There will, therefore, in all probability, be a new Ministerial crisis in France before long, and every crisis brings the day nearer when the PRESIDENT will find himself obliged to ask M. GAMBETTA to take office. Still it is possible that both M. GRÉVY and M. GAMBETTA may have very good reasons for wishing that there should be no GAMBETTA Ministry before the elections of 1881 are held. The PRESIDENT may think that under a succession of shortlived figurehead Ministries Conservative Republicanism will have time to grow. M. GAMBETTA may think that he would appear in a much better light before the constituencies if they had the expectation of what he would do some day, rather than the memory of what he had been doing for a year. But it may easily happen that it will be found practically impossible for M. GRÉVY and M. GAMBETTA to wait so long. The difficulty which M. FERRY has found in filling up his Ministry is very significant. Men who respect themselves are beginning to be shy of forming a Cabinet which may be upset any morning at daybreak because M. GAMBETTA has been talking during the night to one of its members. The PRESIDENT of the REPUBLIC can hardly think that Republican Government is prospering when Republicans of respectability and high standing do not like to take office under it. M. GAMBETTA may discover that there is such a thing as waiting too long, and that a man who always stays in the background may some day be made to stand there whether he likes it or not. The Continental press, and especially the German press, had begun, before M. BARTHÉLEMY ST. HILAIRE's appointment, to write as if M. GAMBETTA was already in office, and to speculate on the dreadful things he would do. This is premature; but it is scarcely premature to say that the accession of M. GAMBETTA to office seems more natural and inevitable than it seemed ten days ago.

THE NAVAL DEMONSTRATION.

IT is not yet known whether the Ministerial change will affect the policy of France in the East; but it has often been stated that M. GAMBETTA, who has lately asserted his paramount influence, is more inclined than M. DE FREYCINET or his predecessor to active measures in favour of Greece and Montenegro. According to the concurrent statement of several Correspondents, the French contingent at Ragusa had before its arrival received positive orders to abstain from hostile operations. Some of them add that the German Admiral was to retire if at any time the concert of the Powers was interrupted. It seemed to follow that the coercion of the Turks and Albanians would devolve on the English and Russian vessels, for neither Austria nor Italy is believed to be zealous in the common cause. The most devoted adherents of Mr. GLADSTONE's Government have lately insisted with much pertinacity on the duty and expediency both of giving active aid to Montenegro, and of blockading the Dardanelles while a Russian fleet closes the Bosphorus; but the Ministers are not bound by the opinion of their adherents; and it would be strange if Mr. GLADSTONE and Lord GRANVILLE wantonly precipitated the country into war. That the policy in which the European Powers have been induced to cooperate is but partially intelligible may be the best reason for believing that it admits of a reasonable explanation. A single Government may be misled by passion or prejudice into capricious modes of action; but when six Powers which are well known to have divergent wishes and interests join in an ostentatious display of force, there can be no doubt that the respective Governments have provided for the contingencies which are likely or certain to arise. Among other risks or inconveniences statesmen cannot have failed to anticipate the professional jealousies or rivalries which might result from the union of six independent squadrons in a single fleet under the immediate command of the senior Admiral. English susceptibility would have been much disturbed if it had happened that a part of the Mediterranean fleet was subject to Russian orders. Mr. GLADSTONE's confident belief that Turkey would yield to the combined pressure of Europe would perhaps have been justified by the result if the decision had rested exclusively with the SULTAN. But the local resistance of the Albanians to the transfer of territory created an additional difficulty, and furnished the Turkish Government with an excuse for obstinacy and for vacillation. Probably the Albanian chiefs might have yielded if they had been convinced that the SULTAN was in earnest; and, on the other hand, the Turkish commander would have surrendered Dulcigno to the Montenegrins but for the warlike preparations of the tribes. The most sagacious and experienced observer would be puzzled in attempting to assign to intrigue or to indigenous patriotism the greater share in a complicated transaction.

It is difficult to ascertain from day to day the truth of statements which are alternately repeated and contradicted. At one time detailed accounts were published of the occupation of Dulcigno by a large body of Albanians, while a Montenegrin force was said to be approaching the town, and RIZA PASHA, in command of the Turkish regular troops, professed to await instructions from Constantinople. It afterwards seemed to be doubtful whether any important movement had taken place; and the fleet was supposed to await the return of an English officer, Lord WALTER KERR, who had been sent with despatches to RIZA PASHA at Scutari. Mr. KIRBY GREEN, the English Consul, is said to have asked for a delay of hostile operations until he could remove his family into a place of safety. It is probably true that Mr. GOSCHEN has remonstrated strongly with the SULTAN; but it is uncertain whether his efforts have been cordially seconded by his colleagues. The latest change of Ministry indicates perhaps rather the SULTAN's preference for personal favourites than any definite policy of resistance. The appointment of SAID and of SERVER, popularly known as SERVEROFF, is, like all more or less suicidal measures, attributed to the influence of the Russian AMBASSADOR; but it is impossible to test the truth of reports which are the more likely to be founded on conjecture when they are intrinsically probable. After the late declarations of Mr. GLADSTONE, no Turkish Government can be expected to feel confidence in the good will of England; but fear may sometimes be as effective an instrument as hope. As the avowed patron and partisan of Montenegro, and as the well-known advocate of the expulsion of the Turks from Europe, Mr. GLADSTONE will be credited with a resolution to use force if verbal remonstrances are found insufficient. MUSURUS PASHA, who of all the SULTAN's advisers alone possesses a knowledge of English opinion, will be able to assure the SULTAN that very few among the supporters of the present Govern-

ment have hinted at disapproval of warlike measures against Turkey. By a strange combination of circumstances, England seems to have undertaken the task of enforcing the performance of those stipulations which were inserted in the Treaty of Berlin, or in an appendix, at the instance of other Powers. The reward to be paid to Montenegro for services rendered to Russia, and the aggrandizement of Greece which was recommended by France, are now supposed to be the special and almost exclusive concern of England.

Mr. GLADSTONE's coercion of Turkey, though it is founded on sentimental and religious sympathies, may perhaps, if it attains its object, ultimately coincide with sound policy. The concert of Europe even to the present time is a considerable diplomatic achievement, and, if it survives the settlement of the Montenegrin question, it will remove many complications and dangers. Several of the Powers are exempt from any selfish interest in Eastern affairs, except the desire to diminish the risks of war; and the only Government which is suspected of aggressive designs is held in check as long as it is compelled to consult the opinions of allies. If the journalists who daily propose war with Turkey, even in default of allies, represent the intentions of the Government, no more insolent defiance of the rules of political justice and morality than an anachronistic religious crusade will have been at any time perpetrated; but, as long as united pressure is applied to a perverse and obstinate ruler who refuses to execute the provisions of a recent treaty, the English Government may be engaged in a legitimate undertaking. The saying that nothing succeeds like success is sometimes erroneously regarded as an immoral paradox; but the first duty of statesmen is to discern practicable objects, and to attain them by efficient methods. If the Turks and Albanians, after all their menaces, peaceably surrender Dulcigno, one cause of trouble will have been permanently removed. On the other hand, it must not be forgotten that the converse of the proposition is true. Nothing fails like failure in means or ends. The naval demonstration is justifiable only if it prevents war by the exhibition of irresistible force. The SULTAN would long since have yielded but for his expectation that the combination would fall to pieces. Mr. GLADSTONE and his colleagues have staked their character and their future reputation on the chance that the SULTAN may be mistaken.

There may probably be no foundation for the rumour that the Albanians were about to baffle their enemies by setting fire to the town of Dulcigno; but the mention of such a settlement of the dispute illustrates the objections to a policy of coercion. In this instance the Congress of Berlin revived the policy which had seemed unobjectionable to the plenipotentiaries at Vienna more than sixty years before. Critics and Liberal politicians have since not been sparing in condemnation of the exclusive regard which was then paid to the supposed interests of States and sovereigns. Whether the inhabitants of a province transferred from one kingdom to another approved of the change of allegiance was a question which scarcely troubled the mind of METTERNICH or HARDENBERG. The Congress more or less consciously continued the traditions which originated with NAPOLEON, or perhaps with the French Republic. There was at that time no reason to fear resistance. The most unpopular measures, such as the annexation of Genoa to Piedmont, or of half Saxony to Prussia, were effected without risk of opposition in obedience to simple decrees. The modern doctrine of national affinities had scarcely been invented; and it had at least not been exaggerated into its modern proportions. Russia undertook the late invasion of Turkey on the pretext of regard for sympathies of race, language, and religion. Even as late as the time of the Crimean war, the connexion between Russia and the subject population of European Turkey was supposed to be merely ecclesiastical, but the study of ethnology and philology had, in the next quarter of a century, provided additional excuses for ambition. As the Slavonic agitation advanced the Greek cause was less actively favoured by Russia; and perhaps the very existence of the Albanians was overlooked. The selection by the Congress, at the instigation of Russia, of a district to be assigned to Montenegro, has since been admitted on all sides to have been determined under a mistake. The substitution of Dulcigno for Tusi was a legitimate diplomatic operation, and the agreement of exchange is fully binding on the Porte; but, in accordance with modern notions or professions, it seems anomalous to compel the submission of the Albanian residents to an alien and hostile race. Nevertheless the least objectionable solution of the difficulty would be the submission of the malcontents to the will of Europe.

SIR FITZROY KELLY.

WITH the death of the LORD CHIEF BARON a long and honourable, if not brilliant or remarkable, career has closed. The peculiarity of that eminent judge was that he was so very old, and yet was not so old but that he could get through his duties with a vigour that never fell below its own standard, and could work on slowly and cheerfully at the age of eighty-four to the day when he would be entitled to retire on a pension. As he was so old, he naturally went back in his professional history to a time which to persons of a later generation seems one of fabulous antiquity. He began his legal studies in the reign of GEORGE III., and there was much in the cast of his mind and in the bent of his opinions which seems to have been fixed once for all at that remote date. Having got as far in special pleading as the human intellect is capable of going, he was called to the Bar in 1824. One of the tenets to which he most fondly and persistently clung was that of the inherent right of the English barrister to a good uninterrupted Long Vacation; and at an early date he changed his circuit when he found that the circuit to which he had unadvisedly attached himself might expose him to a curtailment of the sacred time of leisure. The Norfolk circuit was invariably true to its proper time, and his recognition of its merits was quickly rewarded by a continuous flow of business. When he had been only ten years at the Bar he was made a King's Counsel and a Bencher, and his reputation as a commercial lawyer soon became so great that he was happily forced to give up circuit altogether, and was permanently secured against any irregularity or maladministration of justice breaking into his holiday. He was in every big case. He was counsel to the Bank and to the East India Company, and he had successes in the House of Lords of which those who might have seemed his equals despaired. He could afford himself the luxury of refusing to appear before Parliamentary Committees and of returning gigantic retaining fees because he would not condescend to argue before persons who knew nothing of law. As was natural in a lawyer of such eminence, he early sought to add Parliamentary to legal distinction. But he was not fortunate in his attempts to enter the House of Commons. After two previous defeats, he was returned for Ipswich in 1835, but was unseated on petition. In the election of 1837 he was defeated at the poll, but seated on petition. Unfortunately, when in 1841 his party came into power, he lost his seat for Ipswich, and did not find another until 1843, when he was returned for Cambridge. Sir FREDERICK THESIGER stood in the way of his advancement during the earlier part of the PEEL Ministry, until, in 1845, on the death of FOLLETT, he was made Solicitor-General. During the RUSSELL Ministry he had no seat in Parliament, but in 1852 he found a safe seat in East Suffolk, which he held until he was made a judge; and he was then again made Solicitor-General, and held the office for a few months under the shortlived DERBY Ministry. He had to wait six years more, until in 1858 his friends were once more in power, and at the age of sixty-two he became Attorney-General. Lord DERBY's second Ministry lasted a very short time, and nothing fell vacant while it lasted which was worth the acceptance of an Attorney-General. At last, in 1866, when Lord DERBY was Prime Minister for the third time, Sir FREDERICK POLLOCK graciously made way for a political friend, and at the age of seventy Sir FITZROY KELLY was raised to the bench, and began to count up his years of active service as Lord Chief Baron.

To say that Sir FITZROY KELLY was very industrious and very energetic is not to say anything that specially distinguishes him. All great lawyers are industrious and energetic. They have got to do a great amount of difficult work, and they do it. But Sir FITZROY KELLY had qualities peculiarly his own. He was astute, he was ponderous, and he was ingenious. If there was a subtle way of discomfiting an adversary, he was sure to discover it. He could pick a hole in pleadings with unerring sagacity, and could put

a spoke in the wheel of a case that seemed to be rolling along with comfortable smoothness. But, while he could do the small work of his profession with the certain stroke of an artist, he also did the large work with satisfactory completeness. He went pounding and hammering on until he had exhausted every point. His clients might be sure that the slightest fact that could tell in their favour, would be brought into prominence before Sir FITZROY KELLY had done speaking. At the same time, he could, when special circumstances demanded it, invent and enforce novelties which were always bold and sometimes even startling. In the great case of the BRIDGWATER bequest he achieved the signal triumph of convincing the House of Lords that a limitation under which a succession of heirs were each to have a specified time in which to gain a dukedom was contrary to public policy, and therefore void. But the case in which he let the public into the secret of his audacious ingenuity was that of the murderer TAWELL, whom Sir FITZROY (then Mr.) KELLY defended. That prussic acid was found in the body of the deceased was unquestionable; and it was hopeless to argue that, if prussic acid had been administered, any one but TAWELL could have administered it. There was no shadow of a suspicion that the dead woman had herself taken the poison, and yet the poison was there. Mr. KELLY was more than equal to the occasion. He thought of something which probably would have occurred to no other man in England. He suggested that, although the prussic acid was there, the woman had never taken prussic acid at all. She had, it appeared, been eating apples, and the prussic acid had been evolved in her out of the pips. It is impossible not to admire the courage and self-abnegation with which so eminent a man, an acknowledged leader of the Bar, a great light in commercial law, a candidate for the highest judicial offices, rather than offer no defence at all, adopted a defence which exposed him to so much inevitable ridicule. Even if ridicule did attach to him, he was too strong not to bear it easily, and it was very shortly after the TAWELL case that he was first made a Law Officer. And, late in life as he was made a judge, it cannot be said that his reputation at the Bar had ever faded. In Parliament he had no success. Probably he desired none. He wanted to be the chief of a Court, and he looked on a seat in the House of Commons as the necessary means of attaining the object of his legitimate aspirations. Politics, he may have reasonably thought, were out of his line. He stuck to his party, and read the Duke of WELLINGTON's despatches, and that was enough for him. In one direction, however, he emerged from this atmosphere of tranquillity. For the last fourteen years of his Parliamentary life he was a county member, and he beguiled the partial leisure of his advancing years by coming out as the benevolent squire, the farmer's friend, the enemy of the Malt-tax, and the last and stoutest of Protectionists.

The real misfortune of his life was that, owing to political vicissitudes and the long eclipse of his party, he was not made a judge until he had entered on what was a hale old age, but still was old age. He got through the severe physical work of his office with surprising alacrity, and his faculties remained unimpaired; but his administration of justice laboured under considerable drawbacks. It is damping to a Court when the presiding judge cannot hear what others say, and cannot make others understand when he speaks himself. He made cases very long by constant interruptions, and he occasionally took from the outset a determined preconception which no argument could get out of his mind. On the other hand, he was laborious; he really knew law; and he was eminently courteous. If he had earned a pension by the time when he began to earn one, he would probably have been thought an accomplished, if not a great, judge. Curiously enough, his political tastes seemed to develop more and more as he grew older, and he got into the habit of favouring the civic authorities, at the time of their annual presentation to him as CHIEF BARON, with garrulous Tory disquisitions couched in the style which the perusal of the journals of East Suffolk may have made familiar to him. In his own sphere as a judge he was not to be easily put down, and in the evening of his life he engaged in a controversy with Lord CAIRNS in which he had the advantage of the better cause. He dissented from the majority of the judges of the Privy Council in a leading ritual case, and he let his dissent be known. Lord CAIRNS, by way of crushing him, furbished up an order two and a half centuries old, directing that members of the Privy Council should hold their tongues about all that might take place in their august body. Sir FITZROY KELLY replied by an elaborate demonstration that the command of silence could not be taken to apply to judicial decisions; and, whatever might be the historical merits of his argument, it was obviously ridiculous that clergymen, who, often against their will, are bound by secular law, should not be allowed to know the various opinions of their judges as much as laymen know them. It was surmised that the late Ministry had the intention, shortly before it quitted office, of giving Sir FITZROY KELLY a pension and a peerage. Either the intention had never been entertained, or the rapidity with which the dissolution was followed by the annihilation of the Ministry prevented its being carried into effect. Had these tardy rewards been actually conferred, they would have been recognized as having been fairly earned. As it was, Sir FITZROY KELLY died without a pension, and without any special honour having been bestowed on him. Lesser men have had better luck; but at any rate he has passed away leaving behind him the memory of a man who fought his way up by his own undoubted merits, and of a lawyer who presented to the contemplation of this generation the high qualities, the wide resources, and also some of the defects which distinguished the great leaders of the Bar in days that have now long gone by.

IRISH SEDITION.

THE Government conforms to a long-established but doubtful precedent in permitting unlimited license of speech to lawless agitators in Ireland. It is certainly not a change for the better that their efforts are for the present directed rather to private robbery than to rebellion. The occasional threats of murder which enliven discourses in praise of spoliation are for the most part contained in the responses which form a not less material part of the Land League liturgy than the text of the officiating demagogue. Some of the Roman Catholic clergy decline to take part in the agitation; but in general one of their number is found to preside. The chairman at Ennis, a parish priest, denounced Mr. SMYTH, who was lately returned by the Home Rule party for his supposed patriotism, as a tool of the hated landlords. The congregation replied in the usual formula, "Shoot him," without incurring any rebuke from their ghostly counsellor. It is perhaps indiscreet to pass the same sentence of death on Home Rule members who depart from some of Mr. PARNELL's doctrines, and on landlords who to the crime of improving their estates add the unpardonable guilt of expecting to receive their rents; but brutality erected into a moral code tends to become indiscriminate. At Bandon one of the orators expressed his surprise that Mr. BENCE JONES, who is well known as an improving landlord, had not been subjected to the treatment which would be suffered by a Turk in the midst of a Bulgarian population. There is no arguing with cynical ruffians who have acquired by impunity the advantage of being allowed to defend the foulest crimes, as if the distinction between right and wrong were an open question. To discuss the questions whether property ought to be protected and whether life is to be at the mercy of popular passion is to disturb the foundations of morality. Mr. PARNELL, in his speech at Ennis, so far deviated from the ordinary practice as to dispute the expediency of the sentence of death passed by acclamation on applicants for farms vacated by eviction. He was of course careful not to express or imply the faintest censure on opinions which he nevertheless regarded as unnecessarily vigorous. In his judgment it might be possible to dispense with actual assassination if the life of the delinquent were rendered intolerable by social excommunication. If the minor penalty proves insufficient, patriotic neighbours may be trusted to execute in due time the severer sentence.

One of the peculiar circumstances of the Ennis meeting was the absence of the police, for the first time, as Mr. PARNELL observed, since the commencement of the agitation. The authorities may perhaps have been well advised in avoiding a display of force which was not required to repress any probable act of immediate violence. The demagogues and the mob had the field to themselves, and there were no landlords within reach to maltreat. Mr. PARNELL, as might be expected, hinted to his followers

that the withdrawal of the police was a sign of official timidity or connivance. He had, he said, declared a year ago that the constabulary would be abolished as soon as the people triumphed over their adversaries; and already the police were on the occasion of the meeting consigned to their barracks. Not long since Mr. PARNELL informed the House of Commons, with equal truth and candour, that the question of the land would be at once solved by the disbandment of the constabulary. The Ministers were not prepared summarily to abandon the defence of law and property; but they feebly attempted to conciliate sedition by expressing a hope that it would soon become unnecessary to maintain order by the aid of an armed force. At some meetings property has been publicly destroyed in the presence of bodies of police, which were perhaps too weak to interfere. A circular has now been issued to the constabulary directing them to prevent breaches of the peace. All the danger might have been prevented by the continuance of the Peace Preservation Act, if popularity had not been preferred to public duty. At Ennis Mr. PARNELL forgot, or perhaps deliberately declined, to complain of the rejection of the Disturbance Bill. It would have been inconsistent to propose a general refusal of rent, and at the same time to regret the failure of a plan by which certain landlords were in a part of Ireland to be prevented from enforcing their claims. A ruffianly priest at Ennis boasted that evictions were no longer practised. "Who now dare "evict a tenant? A man must be a great fool who evicted "a tenant." The Liberal Government has not, either by the Disturbance Bill or by Mr. FORSTER's speeches, secured the unqualified confidence of the leading agitator. He admits that the Tory Government was to be regarded as decidedly hostile, while the present Ministers are to be indulged with a tentative delay of a year; but he is evidently prepared to denounce any possible measure which can be submitted to Parliament.

With unwonted toleration Mr. PARNELL permits tenant farmers, without risk of assassination or even of concerted persecution, to give evidence, if they think fit, before the Land Commission; but he expresses his opinion that they would act more wisely in refusing to sanction the inquiry by their attendance. His reasons are not without force. It might, he says, be contended that witnesses were bound by a report founded on their testimony; and it is certain that any possible report will be one-sided, or, in other words, that it will not recommend the transfer of the land from the present owner to the occupier. The Government has interfered in an unusual manner to secure a report favourable to its own theory of legislation; but, unless Mr. PARNELL and Mr. DILLON had been placed on the Commission, it would have been difficult to find avowed advocates of spoliation. On the accession of the Government to office, when Mr. FORSTER still prudently disclaimed any immediate purpose of meddling with the tenure of land, two members of the former Liberal Government, Mr. STANSFELD and Lord CARLINGFORD, were added to the Commission which had for some time prosecuted its inquiries into the condition of landed property in the United Kingdom. It was probably afterwards discovered that the Report of the Commission would not be in all respects favourable to the Land Bill of 1870; and consequently a new Commission was appointed in the hope that its members would be more pliable. As Lord CARLINGFORD and Mr. STANSFELD were not included in the second Commission, it may be conjectured that they refused to separate themselves from their colleagues. Mr. GLADSTONE's expectations will probably not be disappointed; but to Mr. PARNELL one respectable body of Commissioners is as objectionable as another. His conclusions are not founded on details which might be proved in evidence, but on the notorious and undisputed fact that the land belongs to some thousands of owners, and that it is coveted by hundreds of thousands of occupiers. His own political position depends on the hungry multitude, which he accordingly, after the fashion of demagogues of all ages, hounds on to the attack on property. His lieutenants are, according to their eulogists, distinguished by blind fidelity to their chief. If, said one of the speakers at Bandon, Mr. PARNELL were to order Mr. FINIGAN to throw the SPEAKER's mace out of the window, he would obey without hesitation. Mr. FINIGAN would perhaps not be deterred from his noble purpose if Mr. FORSTER were to intervene by brandishing the Disturbance Bill in his face. The instance of imaginary folly and impudence is of course figurative. Mr. PARNELL and his loyal satellite pursue their assaults on law and decency in a more practical manner. It is not for the sole purpose of insulting England that Mr. PARNELL exhorts the Irish tenants to offer the landlord only a fair rent, and, on his declining the tender, to refuse all payment whatever. He adds that, if the landlords are obstinate, it may become the duty of the Land League to prohibit all payment of rent; and he cannot but be aware that there is no real distinction between his present advice and his threatened alternative. No occupier will willingly pay even a shilling in the pound if he thinks that by a prolonged refusal he will be exempt from payment altogether. The proposal of a fair rent to be determined by the debtor as against the creditor is both illusory and insolent. Mr. PARNELL well knows that a rent left to the discretion of the tenant would wholly disappear. Of the compensation to be paid to landlords Mr. PARNELL speaks as usual in an airy tone. No money will, he says, be necessary for the purpose; but the Government, or, in other words, the taxpayers, may, if they think fit, issue paper in payment; and he would probably add that they may discharge their obligations if they think fit. The fallacious precedent of Prussia is of course cited in defence of the proposed transfer of property. The demagogues are careful to suppress the fact that the Prussian peasants were already hereditary owners of the lands, and that STEIN and HARDENBERG only commuted the feudal dues; but controversies such as that which now exists in Ireland have as little to do with historical authority as with economic argument.

JUVENILE CRIMINALS.

THE public interest in the question which Sir WILLIAM HARCOURT started, perhaps rather with a light heart, by his action in the case of WALTER DEAN, increases instead of diminishing. Not merely has a very active discussion on the general question been going on in the columns of the daily newspapers, but certain of the London magistrates have, not injudiciously, brought the matter to a point at which it cannot possibly be allowed to remain. They are acting under more special instructions from the HOME SECRETARY than their brethren in the counties, and these instructions have brought them to a deadlock. Last Monday, for instance, a boy was brought up before Mr. DE RUTZEN, charged with stone-throwing in the Regent's Park. Now everybody knows that the practice of throwing stones at trees in the nut season is not merely destructive to the trees themselves, but extremely dangerous to passers-by; while it makes the Park seats, which are usually placed under trees, simply useless, because nobody dares to sit on them. The facts were proved, and nothing remained but to inflict punishment. The magistrate asked the prisoner's father if he could pay a fine, and the father, like a sensible person, answered "No." Thereupon the boy was discharged, and he and his father left the Court "somewhat surprised at the result." We do not know whether any persons who happen to have their heads laid open or their eyes knocked out by stones will be surprised or not. But such are the consequences of the HOME SECRETARY's attempts to interfere with the administration of the law without troubling himself to ascertain or think out the results of his interference. Parliament, which could give effect to Sir WILLIAM HARCOURT's ideas on the subject, is not likely to be in Session for another four or five months, and during that time we suppose the "trivial offences"—in which, by the way, Sir WILLIAM, in his letter to the Mayor of MANCHESTER, expressly includes stone-throwing—are to go on with impunity. It would be interesting to hear the HOME SECRETARY's opinion as to the triviality of this offence shortly after experiencing in his own person the impact of a piece of granite thrown by a young person of thirteen endowed with a good aim and a healthy vigour of arm.

It is important, however, not to forget that the question of Sir WILLIAM HARCOURT's levity and want of consideration is a different one from the question of the desirableness of some change in the legislation affecting juvenile criminals. The conclusion that some such change is actually called for seems indeed impossible to resist. At present the law provides three different kinds of penalties for such persons, or perhaps it would

be more proper to say four. These are corporal punishment, fine, imprisonment, and confinement for some considerable period in a reformatory. These punishments are allotted to different offences and to different ages of offenders in a very complicated and arbitrary manner; and there seems to be a general consensus of opinion that the law might with advantage be simplified, and discretion left to the magistrate to inflict whatever punishment seems most suitable to the particular case. At present, even putting aside the inconvenience arising at the moment from the HOME SECRETARY'S precipitate and thoughtless action, there is no doubt that great advantage is taken by the offenders of the eccentricities of their enemy, the law. During this very week a curious fact has been recorded in the police reports, which not only puts this beyond doubt, but has considerable value as showing the comparative dislike with which corporal and other punishments are regarded. On Tuesday Mr. BALGUY, the Woolwich magistrate, had several orchard-robbing cases before him. He said that he had always found that the age in these cases was returned at "over fourteen," because the law authorizing whipping limited it to "under fourteen." Therefore, in the first place, it ought to be more generally possible than it is to select the best punishment for the particular case. But then the general question arises, which is the best punishment? To corporal punishment no objections are made save by those who object to corporal punishment altogether, and it may be safely said that those who have had most experience of boys are most firmly convinced of its advantages. Fines are obviously a somewhat clumsy penalty, because they do not touch the boy at all, but only his parents; and though it may be contended that the parents deserve to be punished for not keeping their children in good order, that is a position which, at least as a general one, cannot be sustained. Besides, there is the special objection that fines press hardest on the very persons who are least responsible for their children's acts—hard-working men and women who are away from home the greater part of the day. As to reformatories or industrial schools, or, as the Manchester scheme would call them, "places of "detention," their influence is not allowed to be good by all students of the subject, though, on the whole, the tendency of opinion is in their favour. But, even supposing that influence to be unmixedly good, they have admitted drawbacks. To send every child who committed a trivial offence to such a school or place of detention for a time long enough to produce any good would result in a severe tax on the parent, if the parent had to pay, and in an immense addition to the burdens of the ratepayer and taxpayer, if the expense were charged to local or Imperial account. The modern Radical—or rather Democrat, for Radical is becoming a somewhat inappropriate term—would doubtless be glad to see the State undertake in this way the complete regulation of the individual life, just as he is glad to see compulsory education, and as he clamours for compulsion of all sorts. But nothing can well be more alien to the doctrines of the old Liberal school of politicians, and nothing can more resemble that grandmotherly legislation which was once denounced in a striking manner by a person to whom there is no need to refer more particularly.

There remains, of course, imprisonment, and it is over this that the fiercest quarrel takes place. Sir WILLIAM HARCOURT thinks that the imprisonment of children "poisons the fountains of life." Mr. BARWICK BAKER, a veteran in the discussion of the subject, urges a first imprisonment as one of the most deterrent of punishments, but is strongly against re-committals. Others see in simple incarceration the most effective, the least troublesome, and, on the whole, the least costly, of penalties. It is remarkable that the greatest discrepancy of opinion is as to the effect of the second and later punishments, not of the first. Every one admits that a first whipping or a first imprisonment has terrors; the dispute is whether those terrors continue. Now it seems almost impossible to deny that in the case of imprisonment they do not. For it must be remembered that the terrors of modern prisons are chiefly, if not wholly, moral, the actual physical suffering not going beyond what may fairly be called inconvenience. On the other hand, it seems equally impossible to deny that repeated imprisonments in youth are extremely likely to turn the juvenile criminal into a confirmed scoundrel. Whether corporal punishment loses its terrors by repetition—unless, as in old schooldays, it is almost constant and not very severe—is a much more doubtful matter. It will take a good deal of argument to persuade those who know the human boy that a really sound flogging is less terrible to him in December because he has had one in June. Mere "brushing" may, with familiarity, come to be contemned; not so the sort of thrashing which, of course with due regard to the infliction of no permanent harm, should be administered by the law. Another thing which it seems important to note is the distinction of juvenile criminals into two sharply-marked classes—a distinction of which Sir WILLIAM HARCOURT'S letters take very little count. Even those who fail to regard stone-throwing as a trivial offence will admit that there is a great difference between throwing stones at chestnuts and acorns and stealing, especially repeated stealing, from shops or private houses. The one is the act of a thoughtless and undisciplined boy, the other that of a juvenile criminal properly so called. The treatment of the two classes ought, no doubt, to be proportioned to this distinction. For all offences of the first kind—stone-throwing, window-breaking, stealing fruit, and so forth—there seems no penalty so appropriate as a good sound whipping, repeated, if necessary, on the occurrence of new offences, unless those offences become, as in Master WALTER DEAN'S case, so frequent that the offender may be judged to have passed into the criminal class proper. With this latter class, which an experienced magistrate would have no difficulty in discriminating, the mere repetition of flogging would probably be useless. Flogging for a first offence, imprisonment for a second, and for a third the reformatory (by whatever name it is to be called), suggests itself as a programme. The long detention implied in the last stage is almost certainly necessary, because such offences as it contemplates are in most cases committed for the profit of other and older persons, who are not reached by flogging their agent, and from whose influence it is desirable to remove the child. Had the HOME SECRETARY elaborated some such scheme as this, and obtained the consent of Parliament to it before beginning his crusade against magistrates, he would have deserved only praise; and to the elaboration of some such scheme, though he has put the cart before the horse, he must come if he is to do any good. But the experience of most magistrates, and specially the remarkable case quoted above, seems certainly to show that it would be well to leave as wide a margin of discretion, especially in the point of age, as possible, both in order to prevent deliberate evasion of a particular punishment, and to enable the judge to suit the whip to the back.

THE TRADE-UNIONS CONGRESS.

THE Trade-Unions Congress at Dublin has met and separated in the midst of a chorus of adulation. Liberal and Conservative journalists have vied with each other in celebrating the prudence, the moderation, and the foresight of delegates who, to do them justice, never disguised their exclusive regard for the interests of their constituents and their class. A Congress of landlords discussing in public the best means of raising their rents and coercing refractory tenants would perhaps not excite equal admiration. Manufacturers find it convenient to arrange in private their methods of resistance to the dictation of associated workmen. Combinations to raise wages, to shorten the hours of labour, to increase the liabilities of employers, and to procure for artisans additional political power, are exempt from sweeping condemnation because they are lawful, and indeed unavoidable; but it seems unnecessary to feel or affect enthusiasm for the organization of special interests against the general community. The compliments which have been paid to the Congress would not, if they were analysed, always imply genuine flattery. It is evident that some zealous eulogists are surprised and gratified by the discovery that Trade-Unions are not in the habit of avowing sympathy with crimes against property or with injuries inflicted on dissentient workmen. It is true that the praises which have been lavished on the proceedings of the Congress are not mainly to be attributed to negative causes. At all times power has commanded applause, and power has now passed from the few to the multitude. Seventy years ago the poet invoked blessings on princes and on great proprietors :—

> God bless the Regent, bless the Duke of York!
> God bless each man possessed of aught to give!
> Long may Long Tilney Wellesley Long Pole live.
> And oh! in Downing Street should Old Nick revel,
> England's Prime Minister, then bless the Devil!

Household suffrage has now a great deal to give. It disposes of boroughs; it will shortly command counties; and it naturally becomes the object of benediction.

Some of the speakers, referring naturally to the selection of Dublin as the place of meeting, expressed the opinion that it was highly desirable to raise the rate of Irish wages, and to shorten Irish hours of labour. Both propositions are more than questionable; and it seems unnecessary to propagate in Ireland the doctrine of combination. Many attempts to enrich the country have been baffled by the local propensity to conspire against capitalists and employers. It would seem from the reported debates of the Congress that the Irish workmen took little interest in the meetings; for nearly all the resolutions which were discussed or passed related to the general policy and interests of the Unions. One of the peculiarities of the Congress was the growing disposition to aim at political power as an instrument for obtaining economic results. The delegates unanimously supported motions for the extension of the suffrage; and proposals for the return in large numbers of working-men to the House of Commons were, as might be expected, generally supported. The spirit in which legislative functions would be discharged was illustrated by the reception accorded to the Employers' Liability Bill. While gratitude was expressed to the Government for its services to the working class, the Bill was only accepted as an instalment of a more sweeping measure. A letter in which Mr. Macdonald protested against the power of employers to make special contracts with the men was inserted in the record of proceedings, and apparently adopted as a decision of the Congress. Employers will probably regard with some uneasiness the kindred agitation for the admission of working-men to the jury pannel. The object of the demand is probably to secure workmen against penalties which they might incur, and to make the Employers' Liability Act effective by the imposition of heavy damages. The Congress passed a resolution to the effect that the State, or, in other words, the upper and middle classes, should relieve the working population from the cost of primary education. A House of Commons representing Trade-Unions will have no hesitation in adjusting taxation so as to throw all other fiscal burdens on the unhappy owners of property. The courtiers of democracy may congratulate their patrons by anticipation on the probable attainment of all their principal objects. The upper and middle classes may perhaps be equally selfish; but if they really care only for themselves, they practise the decent hypocrisy of professing a regard for the public good.

The change of opinion or of language as to the merits of Trade-Unions is curiously illustrated by the suppression of a once popular treatise in which their theory and practice were summarily condemned. Thirty or forty years ago Archbishop Whately expressed in a school book the opinions which were held by nearly all economists of his time. On a remonstrance being made against language which is naturally distasteful to Trade-Unions, the Archbishop of Canterbury judiciously promised that the Council of the National Society would withdraw the obnoxious document from circulation. It is certainly not expedient to tell the children of associated workmen that their parents are guilty of an error or a crime. The Congress, not satisfied with the Archbishop's prudent concession, still objects to the alleged use in certain schools of old copies of the incriminated treatise. School managers will do well to remove a pretext for cavil; and pupils will gladly dispense with any possible manual of political economy. They have perhaps hitherto been protected by stupidity and inattention against the baneful effects of Whately's antiquated doctrines. The plain-spoken prelate would have appreciated but imperfectly the rhetorical disquisition on things in general, including capitalists and workmen, with which Dr. Ingram, a Fellow of Trinity College, gratified the audience. It may be interesting to regard the capitalist as a social functionary "entitled to "respect by what is really a public office"; and it is possible that "respect might on that ground be shown to him "by his inferiors without hypocrisy or servility, even "when his private character was entitled to little "esteem." The practical bearing of such moralizing is not obvious; and a shareholder in a Joint-Stock Company can scarcely flatter himself that he is entitled to reverence as a public functionary. With equal originality Dr. Ingram advised working-men to marry good wives; and in his peroration he observed that "the truly vital interest "of working-men was that the whole class should rise in "material comfort and security, and still more in intel-"lectual and moral attainments." It is interesting to learn that Trade-Unions are not superior to a love of twaddle. Archbishop Whately provided strong meat, though it may not have been universally palatable. In their prosperous maturity Trade-Union Congresses seem to be satisfied with milk watered down to suit an infantine capacity.

Some difference of opinion was expressed on the subject of co-operative production, though resolutions were passed in its favour. Dr. Ingram objected to co-operation, because "he had no faith in moral regeneration founded on "motives of self-interest"; but, if the system really conduces to the benefit of those who are concerned in it, there seems to be no reason for considering questions of moral regeneration. High wages, profits, and independence offer no obstacle to moral regeneration; but co-operative factories have too often failed in bad times, and it is found impossible to obliterate the distinction between the capitalist and the workman. The shareholder may be in some instances the same person who works in the mill; but in one capacity he is concerned to pay the smallest wages, and in the other to receive the largest. Although the experiment of distributive co-operation has succeeded, productive co-operation is still on its trial. The system is probably not adapted to trades which are liable to great vicissitudes of demand and of price. No other subject discussed at the Congress was so little connected with the antagonism of the working class to capitalists and consumers. It is one advantage of public discussion that objectionable topics are as far as possible kept in the background. The mention of strikes was confined to an occasional repetition of the fallacy that Unions tend to the discouragement of trade conflicts. They may sometimes effect the object without resorting to actual stoppage of work, but their main function is to make strikes formidable to employers. Nothing was said of past or future contests, though at this moment much of the industry of Lancashire is threatened with suspension in consequence of a demand for an increase of wages which the employers have refused. The mill-owners declare that there is no case for arbitration, and they have determined to assist their colleagues at Accrington, who are the immediate objects of the threatened strike. If the conflict proceeds, it may be hoped that the Unionists will not repeat the outrages by which a portion of their body disgraced itself on the occasion of the last strike. It is impossible for strangers to judge whether the request for increased wages is reasonable. Former precedents show that it is not likely to succeed.

LONDON WATER SUPPLY.

THE Report of the Committee on the late Home Secretary's plan of acquiring the undertakings of the London Water Companies contains two distinct kinds of information, the value of which is by no means equal. The greater part of the Blue-book which contains it is occupied by the evidence which the late Mr. E. J. Smith gave in his severe and searching examination before the Committee. This evidence, as well as the plan which it failed to sustain, is by this time ancient history. The period during which the agreement was valid has expired. The Committee (as perhaps it may without unfairness be said, was certain from the day of their appointment) decided against it, and it has ceased to possess any actual value except as a contribution to the working out of the question by what old arithmetic books used to call the "rule of "false." Sir Richard Cross's plan will at least serve his successor, or any one else who aspires to the honour of settling the problem, as a *terminus ad quem non*, as something to be avoided and refused. The Report itself deals at no inconsiderable length, as was indeed requisite, with this part of the matter; but it also deals with other and now more practically interesting points. The question of the existing income of the Water Companies and the way in which it is levied, of the claim constantly made to increase that income without any corresponding increase of outlay on the part of the receivers, or of benefit to the payers, the constitution of a Water Authority to perform the functions, and more than the functions, of the late Home Secretary's still-born Water Trust, and, most interesting of

In truth, exaggeration would seem to differ from perfectly free invention very much as illusion differs from hallucination in the sphere of sense-perception; it is always marked off by the presence of some minimum amount of external reality.

In general, exaggeration has for its aim the production of some desired effect in another mind. Yet it must not be supposed that it always directs itself towards this end with full consciousness. Often, indeed, it seems to arise more from an instinctive impulse than from a conscious purpose. When, for example, an angry man launches out in reckless denunciation against the object of his anger, or when an excitable young woman in view of some beautiful scene declares it to be unsurpassable, it is clear enough that the hyperbolical statement is born of an emotional impulse. Sometimes, again, exaggerative description seems to arise quite unconsciously from the reaction of imagination on the impressions made on the mind. People of a lively fancy tend to magnify their experiences by a gradual process of transformation of which they are scarcely aware. By far the larger part of exaggeration, however, involves the presence of an intention to produce an effect, though this purpose does not always betray itself with the same degree of clearness. In many cases it is quite impossible with the closest attention to say how far the dealer in hyperboles has been deliberately aiming at a result. And very likely the person himself would find it almost as difficult to decide the point as his hearer.

Omitting the species of exaggeration that obviously springs from a present emotional agitation, we may roughly distinguish between three varieties—the earnest or intense, the cool or perfectly dispassionate, and the genial or playful. The first kind is that common with people of an eager temperament, whose feelings are warm and their convictions strong. Their experiences make a deep impression on their minds, and a craving for sympathy, together with a strong desire to sway other minds, naturally leads them into the habit of exaggerating. They enlarge perhaps on their personal grievances, and have a way of presenting these to you which is fairly certain to produce an illusion of reality. Or possibly they have been offended by something improper in others, and they put this to you in a light that for the moment makes it seem atrocious. This kind of exaggeration is particularly convincing through the contagion of the narrator's manifest earnestness and warmth. The magnifying of a trouble or of a fault which would at once appear ludicrous if we could see it apart from the manner of the person who perpetrates the exaggeration imposes on us as the result of earnest conviction, as something singularly sincere and free from artifice. And there is little doubt that people of this class do manage to a considerable extent to deceive themselves as to the real proportions of the things they thus misrepresent. The use of hyperbole with them is not a fully conscious process; it rather springs directly from peculiarities of their moral nature. Hence its peculiar effectiveness. To simulate this warmth of manner in order consciously to produce its legitimate effect is a high attainment of art. Thus the successful scandal-monger, so skilfully depicted in Sheridan's well-known play, who knows how to put on the appearance of being dreadfully shocked at a trifle for the sake of gratifying the impulses of detraction, always seems to us an artist of no mean rank. In the regions of public oratory and literature the perfectly successful use of exaggeration in order to produce some serious mental effect is by no means common.

In the second variety of exaggeration conscious art seems to be more uniformly present. The cool, phlegmatic person who habitually exaggerates with perfect composure and without the least appearance of effort is in certain respects an admirable figure. He has a knack of bringing out marvellous stories as though they were the most commonplace recitals. He is never at a loss; and, however high the pitch of astonishment already attained by others, he is always capable of transcending this by some new narrative. To judge by his conversation, all his experiences are of an exceptional character. Yet so cool and self-possessed is the manner of recital that, unless we are previously warned, we easily suppose the narrative to be perfectly authentic. Even if we perceive an element of inaccuracy, any suspicion of fraudulent intention is at once disarmed by the look of perfect candour with which the story is told. We set down the exaggeration to an automatic mental process, arising out of some peculiarity of the mechanism of imagination. If the art of the earnest exaggerator consists in closely imitating the signs of a deeply-felt conviction, that of the cool habitual exaggerator lies rather in the simulation of the naturalness and fluency of an artless recounting of fact. In literature, notwithstanding the responsibilities supposed to attach to public statement, this kind of exaggeration is not infrequent. The disposition to vivid imagination which characterizes the literary mind, and the action of a strong desire to produce an effect of the marvellous, have led again and again, even in such serious branches of literature as autobiography, history, and books of travels, to this perfectly calm and natural species of exaggeration.

The third variety of exaggeration is perhaps the most familiar. We all know the mirthful type of man who, for the sake of raising a laugh, grossly overstates what he sees and hears. The eager caterer for the amusement of others can hardly help becoming a systematic exaggerator. The actual complexion of things needs to be touched up if it is to produce a thoroughly comic effect. What is laughable in an incident must be disengaged from the surroundings which are apt to hide it from view, and in the process of being detached it naturally gets a good deal intensified. So disposed indeed is the amusing person to the trick of exaggeration that it becomes a second nature, and often wears the aspect of something perfectly spontaneous and unpremeditated. And it is this appearance of naïveté and spontaneity which gives the finishing touch to this kind of exaggeration. The caricaturist who brings out his rapid series of impromptu sketches with no trace of a consciousness of artifice in his face is irresistible. The effect is heightened when there is an appearance of the absence even of a consciousness of the funny character of his descriptions, for in this case the absence of conscious design is even more strongly suggested. The peculiar effect of certain kinds of humour in literature, more especially the well-known American variety, seems to depend on the simulation of an air of perfect ingenuousness and innocence. It is to be observed, however, that the art of tickling the mind by exaggerated description does not necessarily involve the same degree of illusion as the first two varieties. In a general way we are not disposed to view one who regales us with merriment in the light of a possible deceiver. So long as we are amused we do not closely scrutinize the verisimilitude of the story, though we may begin to do so when prolonged cachinnation sets up a feeling of fatigue in the muscles concerned. Indeed it has been observed by Charles Lamb that the comedian may often take the spectators into his confidence, keeping up a tacit understanding with them with no loss, but rather a gain, in effect. And this shows that the man who aims at amusing us by comic narration is not closely bound to appear truthful. His art lies much more in selecting appropriate additions to fact. If only the exaggeration is seen to grow out of the perception, if there is a discoverable germ of the ludicrous feature in the reality, we easily allow ourselves to be cajoled into accepting it.

We have spoken of the effect of exaggeration as a kind of illusion, and this suggests that all exaggeration, including the last species, acts by producing a momentary belief in the assertion made. Nor is it difficult to see why this is so. All verbal affirmation tends to excite belief in the hearer's mind, and, as we have seen, the exaggerator is for the most part careful to wear the aspect of veracity. Since, moreover, to exaggerate is simply to add to fact, it is plain that when the fictitious element is wisely chosen it must be exceedingly difficult to suspect inaccuracy. So far, then, as it is knowingly pursued as an art, it must be the first business of the artist to emphasize the element of reality and to surround this with congruous and appropriate adjuncts. For the rest the method will vary according to circumstances. The appearance of strong emotional excitement must of course be always avoided, since this is too distinctively suggestive of bias and self-deception. But, as we have seen, great earnestness of manner may well be cultivated in those cases where a certain warmth of feeling is appropriate. On the other hand, when the statement is not of a kind to need such feeling as its accompaniment, the style of exaggeration cannot have too much of the artistic element of repose.

The reason why we are much less exacting in the matter of verisimilitude in the case of laughable exaggeration has been partly suggested by Charles Lamb. All illusion is dispelled by a corrective action of the mind. In the case of exaggeration this means an awakening of the critical faculty to note the various aspects of the statement which bear on its truth or falsity. Now we are not always equally disposed to make this intellectual effort. In a general way, we listen to an exceedingly painful narrative in a much more critical mood than to a very agreeable one; the natural impulse to throw off what is distressing makes us quick to spy logical defects. This is why pathetic description so easily appears exaggerated. The recognition by cultivated minds of a note of false pathos in many of Dickens's descriptions is due to a sharpened critical faculty specially awake to all attempts to make too much of the painful element of life. If, on the other hand, the effect of exaggeration is wholly pleasant, our instinct to seize and retain what is agreeable acts as a sort of soporific on the critical faculty. Thus, in the gay moods of comedy, we are naturally averse to rigid scrutiny. Another reason why we are less careful about perfect accuracy in the case of amusing narrative or description is that a suspicion of exaggeration, even if it should arise, is much less fatal to the desired effect than in other kinds of recital. If we find that a man has been overdoing an account of some catastrophe, or even drawing on his imagination in the description of some unexciting personal experience, we naturally feel that we are imposed on. But if the motive of the exaggeration is at once seen to be a desire to amuse, we easily forgive the imposition. And, strange to say, as soon as we have performed this little act of generosity, we find that the actual consciousness of the exaggeration adds a new element of lively gratification. For exaggeration, when harmless, is in itself a form of incongruity, and so is fitted to excite our amusement. And if we are sufficiently good-natured, the very sense that we ourselves are being half imposed on by the well-executed piece of extravagance may introduce a still further element of hilarity. Thus it is that we are able to go on enjoying comedy or the extravagant representations of a lively talker, when all the while there is an under-consciousness of the illusory element. The degree of illusion is sufficient for the effect, and the recurring sense of unreality only seems to strengthen the effect by adding another harmonious vibration of pleasure.

The art of successful literary exaggeration is thus often a matter of some delicacy and tact. To suppose that people will swallow exactly the same amount of exaggeration, whatever the style of composition, is the error of inexperienced and undiscerning writers. If, for example, a man is writing in a cynical vein against some form of social annoyance, the length of the imaginative tether

we allow him will depend on what we represent to ourselves as his state of mind. If he writes about bores, and seems to feel really plagued by the people he describes, we do not easily brook exaggeration; we naturally turn round and ask why he lets himself be "sat upon" in this feeble fashion. But if he evidently writes in a playful mood, we allow him to go very much further. This may suffice to indicate the conditions of exaggeration as a fine art. Of its ethical aspects we prefer not to speak, since it would easily seem an instance of transparent exaggeration to enlarge on the evils of what rarely deceives anybody long, and the worst consequence of which is probably an occasional injury to the finer sense of truth in the exaggerator's own mind.

CHRISTIAN PILGRIM NOTE PAPER.

SINCE the celebrated moral pocket-handkerchiefs of half a century ago, it may be doubted whether any invention of equal ingenuity has suggested itself to the mind of man until the device the name of which stands at the head of this article. Illustrated note paper used at one time to be rather a favourite institution, especially in connexion with watering-places. Some of it was comic; and everybody must remember the sheets which bore an engraving—borrowed, if we mistake not, from Leech—representing an unutterably hideous bathing-woman subjecting infants to watery tortures. More generally the scenery of the watering-place formed the heading—very neat rows of lodging-houses, with a church in the distance and a row of bathing-machines in the foreground, generally doing duty impartially enough for Hastings or Bognor, Broadstairs or Southsea. It is believed that stationery of this kind still flourishes; but the institution of monograms has rather cut the ground from under it. The Christian Pilgrim Note Paper which lies before us is an effort of a higher kind. Scenes from the *Pilgrim's Progress* decorate the upper half of its obverse leaf, outlined in the manner of Retzsch. It is particularly interesting to observe that the curious costume generally associated with the Prince of Denmark and his friends is here adjusted to the personages of the famous allegory. All the male characters have those peculiar tight fleshings, belted very much at the waist, and surmounted by a neat little jerkin and an elegant cap and feather, which distinguish the inhabitants of Retzschland. Their swords hang at the same angle, and their moustaches have evidently been trimmed by the same artist in hair. Christian, indeed, is particularly like Horatio, and the scene where Pliable and Obstinate endeavour to mislead him, and where he breaks away from them, is for all the world like the German draughtsman's conception of Hamlet breaking away from his friends in search of the Ghost. We only miss those very attractive gusseted—is that the proper word?—*hauts-de-chausses* which sometimes diversify the fleshing arrangement. It is needless to observe that the Christian Pilgrim Note Paper is intended to do more than merely delight the letter-writer with pleasing views. It is intended to inspire him with proper thoughts, to keep the verities of the Christian religion before his eyes, and, in short, to soften his manners and exercise a generally beneficial influence upon him. It is even suggested that by a cunning selection the drawings might be made appropriate to the subjects of the letter; though, as their number is decidedly limited and their connexion with the ordinary affairs of life not obvious, the suggestion seems more well meant than practicable. Indeed the expectations of the effect of the Christian Pilgrim Note Paper entertained by its promoters and panegyrists strike a sober critic as, on the whole, enthusiastic. The *City Press* thinks that this note paper will "lessen the difficulty" caused to missionaries by "the undue prominence given to abstruse disputations among Christians themselves." In short, though zealots may fight about doctrines and churches, he can't be wrong who is well provided with Christian Pilgrim Note Paper. This seems to partake of the error of fetichism. But it is proper to mention that the publisher of the Note Paper does not seem to entertain quite such exalted views of his invention. He is, however, a practical man, and has taken a practical view of the matter. Having ascertained from *Whitaker's Almanac* that there are 18,000,000 Episcopalians, 14,000,000 Methodists, 13,500,000 Roman Catholics among English-speaking peoples, and that Presbyterians, Baptists, Congregationalists, Unitarians, minor sects, and "no particular religion" divide the rest, he has sent a specimen of Christian Pilgrim Note Paper to representative persons of each persuasion. He has published the answers, and they make a collection which is, if possible, a greater curiosity than the Note Paper itself.

The Episcopalians are represented by the Archbishop of Canterbury and by Mr. Daniel Wilson, a representation which is perhaps not altogether exhaustive. The Archbishop is more cautious than he has sometimes shown himself in his correspondence, and commits himself only to the statement that the outline subjects are "very prettily done." Nor has he, so far as we have observed, in his recent visitation recommended Christian Pilgrim Note Paper as a means of promoting unity. So, too, the Vicar of Islington contents himself with the statement that he "very much admires the new note paper." This, it will be observed, is, like the Archbishop's, a wholly æsthetic judgment, and does not enter upon the question of the advantage of Christian Pilgrim Note Paper to missionaries, or of its efficacy as a healer of the wounds of Christendom. Cardinal Manning is much less guarded. He, too, is partially æsthetic, and considers the designs to be "executed with great skill and taste." But he goes further than this. He "considers the intention exceedingly good." This is complimentary, if nothing more. But there is much more. His Eminence thinks that the introduction of this Note Paper "will be productive of much good," as it will "place higher and more Christian ideas before the minds of the world." The Cardinal is rather well known as a crotcheteer from his temperance advocacy; but this enthusiasm for designs from the *Pilgrim's Progress*, as "likely to be productive of much good," leaves his championship of water far behind. It should be noticed that his Eminence's comparatives are a little puzzling. The ideas suggested by Christian's tights, Pliable's feather, and the hornlets and winglets of a very pleasing fiend, who is shedding influence malign over Sloth, Ignorance, and Presumption, will place higher and more Christian ideas before the world. Higher than what? is the question that naturally suggests itself, and the answer is hardly clear. The Methodist fourteen millions are represented by the President of the Wesleyan Conference, who thinks the etchings beautiful and well fitted to promote the object stated in the advertisement. The object stated in the publisher's advertisement is, as far as we can make out, the perfectly legitimate and businesslike one of selling the sheets of Note Paper at so many for a shilling. But perhaps the President of the Wesleyan Conference adopts the sanguine views of the *City Press*, and thinks that the Note Paper will be a convenient substitute for creeds and confessions. The Moderator of the Synod of the "Presbyterian Church of England" is again a cautious man, and confines himself to the statement that he "honours the motive." The Chairman of the Congregational Union is critical, not to say sententious. "If," says Dr. Allon, "'a song may win him who a sermon flies,' Art may direct thought to religious things that could not be otherwise arrested." Why Dr. Allon should wish to arrest religious things we do not quite know. But perhaps it is the thought and not the things which are to be arrested, in which case the Chairman of the Congregational Union is in need of a few short lessons in English composition. However, Dr. Allon picks himself up again, and concludes with a laconic utterance worthy of Victor Hugo. "Bunyan," he says, "interprets all hearts." Therefore it is evident that the Christian Pilgrim Note Paper which interprets Bunyan is suitable for the communications of all hearts. Mr. Spurgeon's commendation and God speed has a certain grimness about it. "I wish success," he says, "to everything that brings truth before thoughtless people." This limitation of the range of the Christian Pilgrim Note Paper seems a little unkind. The Church of England, the Church of Rome, the Methodists, the Presbyterians, the Baptists, the Congregationalists, having been spoken for by these great persons, there remain unaccounted for the Unitarians, the minor sects, and the "No-particular-religion" people. Perhaps the Rev. T. Freckleton of Unity Church is a Unitarian, though our acquaintance with his particular form of belief does not warrant us in pronouncing him to be such. He appears to be more strongly convinced than any other person of the probable effect of the Christian Pilgrim Note Paper in promoting the unity of Christendom. Judging by the arrangement, the minor sects are answered for by Mrs. Pennefather of Mildmay and the no-particular-religionists by Lord John Manners. This is certainly a libel on Lord John. As for the lady, we are in the same state of ignorance as we are with regard to the Rev. T. Freckleton. Mrs. Pennefather promises her good word to the enterprise, but Lord John Manners associates himself with it by making a suggestion for its further improvement. In the specimen engravings there is a legend under each, but not so on the Note Paper, and the late Postmaster-General would like to have it there too. Not very long ago it was Lord John's bounden duty to endeavour to increase the consumption of note paper by all fair means, so as to swell Her Majesty's revenue, and as the correspondence is undated, this may have been one of his efforts in his vocation.

It cannot be supposed that such a brilliant idea as that of the Christian Pilgrim Note Paper will be allowed to remain the exclusive property of Christianity. We should imagine that Cardinal Manning has already suggested to his Temperance friends the propriety of following the example. Note paper with drunkards of the finest Cruikshankian type represented at the top would be quite in harmony with the general character of the movement, and Sir Wilfrid Lawson making his annual motion, Cardinal Manning leading Temperance processions through the streets, and many other ennobling subjects suggest themselves as variations. From the Temperance people the plan will naturally be borrowed by the anti-vaccinationists. For them a better heading can hardly be imagined than Mr. Dodson's celebrated group of the policeman, the tortured infant, the fiendish doctor, and the agonized mother. Perhaps some of the old plates, already referred to, representing the woes of infants at the hands of bathing-women, might be worked up for this purpose. The bathing-machine could be transformed into a surgery and the bathing-woman into a policeman with the greatest ease and with a certainty of success, while the infant, which, if we recollect aright, is very plump and squalls loudly, would be available without the slightest alteration. Indeed the capacities of illustrated note paper are endless, and if the machinery is half so powerful as Cardinal Manning, Dr. Allon, and others of its panegyrists affirm, no earnest agitator can afford to neglect it. Even politics proper are not beyond its sphere, and it would be easy to give hints to any draughtsman for a striking and appropriate series of

plates representing the chief performances of Her Majesty's Government during the past Session. As for the Christian Pilgrim Note Paper itself, we very sincerely hope that it may produce all the good which its friends expect from it. No statistics, we believe, are available as to the actual improvement in morality produced by the use of moral pocket-handkerchiefs; and it may not be easy to gauge the advances made towards the unity of Christendom by the employment of Christian Pilgrim Note Paper. But, as the representative men say, almost with one accord, the motive is excellent; and if thoughtful writers—or, as Mr. Spurgeon thinks more likely, thoughtless ones—find their tone becoming higher as a result of the contemplation of the tights and the feathers and the other belongings of these Christian pilgrims, why so much the better for them and for the publisher and for the world at large.

SOME EARLY ALPINE LITERATURE.

A FEW weeks ago we gave a retrospective review of the account of Mont Blanc printed by Mr. H. M. Atkins in 1838. By one of the coincidences well known to book-hunters, two more early Alpine records have come in our way unsought; one is the account of an ascent of Mont Blanc a few years earlier than Mr. Atkins's, the other is a book of general Swiss travel. Both belong to the second period of Alpine literature and exploration, as it may be called. Not counting the prehistoric times of ignorance (whereof a word presently), in which it was barely known that there were icy mountains in Switzerland, the first period may be dated from Pococke and Windham's visit to Chamonix in 1741. Alpine travelling was thenceforward known as a thing difficult, dangerous, and eccentric, but conceivable. Rousseau gave the æsthetic impulse which had been wanting, and mountaineering was born. To this period belong the first conquests of Mont Blanc by Jacques Balmat and De Saussure. Its end may be roughly marked by the Treaty of Vienna; or we might for a more precise boundary take 1818, the date after which the ascents of Mont Blanc become comparatively frequent. Then comes the second period—a time of research often eager and strenuous, but not yet systematic, in which mountaineering gave signs of vigorous youth, though not yet a formed and full-grown art. This brings us down to about the middle of the century, or say 1852, when Albert Smith began lecturing on Mont Blanc, and from which time M. Charles Durier, in his excellent monograph, dates the modern popularity of the mountain. In the third quarter of the century the conquest of the Alps has advanced no longer by the attacks of occasional adventurers, but by systematic and unremitting invasion. As far as exploration and survey go, it is now, except in some outlying parts, all but complete. What further developments of mountaineering we may see in the course of another twenty years it would be rash to prophesy; some say that mountaineering without guides has a great future before it. At all events we must not assume hastily that the present generation of climbers have reached the limits of skill or success. Within the last twenty years, we think, certainly within the last thirty, routes and passes have been described by good mountaineers as utterly impracticable which have since been repeatedly traversed. Still more strikingly is the belief in progress confirmed when we turn back to the accounts of half a century ago, and observe the vast difference made by training and experience on the mountains, and possibly by the general raising of the standard of physical cultivation among the well-to-do classes, between that time and ours.

Here we have the relation of an "Ascent to the Summit of Mont Blanc in 1834," an enlarged reprint of two lectures by Dr. Martin Barry, President of the Royal Medical Society of Edinburgh. His ascent was remarkable as being the first that had been made for four years, and the first ever made so late in the season (September 16). There is a page or two of introduction about Switzerland in general, including a notice of the view from the Faulhorn, described as "a peak of the Oberland of Berne," still "but little known." But Dr. Barry comes to his point pretty soon. The book is provided with a carefully numbered panorama of the chain of Mont Blanc, and the description of Chamonix in the text is interspersed with references to this in a manner which has an odd effect. As thus:—

> Beneath that heaven-high wall of frowning rock and chilling ice, bordering upon the barrier of permanent congelation, and like an oasis within a wilderness of frost, was the green vale of Chamonix, smiling with rural beauty and the abodes of man; the river Arve (49) rising at my feet, and winding its way in silver through the meadows of that vale.

From poetry we jump to science. Dr. Barry, like a true Scot, takes Ben Lomond as his unit of magnitude, and shows how Mont Blanc above the snow-line would hold eight Ben Lomonds, and the whole mountain down to the sea-level would cover at least ninety. The ascent appears to have been unusually difficult; the methods employed are described more in detail than in Mr. Atkins's book, but show mountaineering as still in a rude stage. The traveller had "bifid iron points" screwed into his shoes before going on the ice. Short ropes, "twelve or fourteen feet long," were used to secure the party "in twos and threes" on the snow-fields. There were six guides; but, it seems, only one axe among them—a common woodman's axe, for anything that appears. Dr. Hamel, however (1820), speaks of a special "Eisbeil" as a recognized instrument. In any case it was not like the modern ice-axe, for in one of the two lithographed sketches which adorn the book the leading guide is seen holding a long alpenstock in his left hand, while his right wields a short-handled axe with which he is cutting steps. A terrific description is given of the Glacier des Bossons; but comparison of other early accounts makes the conclusion inevitable, after all reasonable allowance for exaggeration, that this part of the journey was really much more difficult fifty years ago than it is now. Another point on which all these accounts agree, and in which the authors cannot have been wholly mistaken, is that the Grands Mulets are represented as very troublesome of access. Fellows, Barry, and Atkins, all describe the ascent from the glacier to the sleeping-place as a long and severe spell of mixed ice and rock work. For the last twenty years or more there has not been the slightest difficulty at this spot. The curious reader may be referred for a plausible solution of this puzzle to M. Durier, who considers that the rocks must formerly have been struck at a much lower point. But as to the actual conformation of the Grands Mulets, we fear that no way can be devised to save the accuracy of these early climbers. With one accord they give sketches in which the rocks appear about as steep as the spire of Salisbury Cathedral. Not only the eyesight of later travellers, but the passionless and inflexible evidence of photography, tells a widely different tale. We can only suppose that these good people, bewildered by the novelty and difficulty of the expedition, were carried away by an inflamed imagination. It is well known, indeed, that unpractised eyes are apt to estimate an incline much in excess of its real steepness; but to draw a steeple where you see a good broad rock buttress requires something more.

Dr. Barry was to some extent a scientific observer, and was on the watch for the symptoms then commonly felt at great heights, and attributed to the rarefaction of the air. No remarkable fatigue was noted till within a thousand feet of the summit, when exhaustion and difficulty of breathing came on; when rest was taken on the completion of the ascent, these troubles vanished as suddenly as they had come. Appetite entirely disappeared, and only an unquenchable thirst remained. Atkins records the like feelings, and Fellows's party had suffered even more. How different has been, in the great majority of cases, the experience of later travellers! A good published instance is M. Durier's own, which he gives in discussing this very topic:—

> Nous n'avons pas éprouvé le plus léger malaise, pas même d'essouflement, et on me permettra d'en citer une preuve un peu vulgaire, mais décisive: nous sommes montés par l'arête des Bosses et, au bas de la dernière rampe de glace, courte mais fort escarpée, j'ai allumé une pipe et c'est en fumant que je suis arrivé au sommet de la montagne—au scandale, du reste, de notre guide, qui me disait: "Mais, monsieur, on n'est jamais arrivé au sommet du Mont Blanc en fumant!"

Moreover, the greater height of Elbruz has been twice scaled of late years without any inconvenience being felt even by the native porters who accompanied the English travellers, and were not themselves practised mountaineers. It is abundantly established that mountain sickness, as it is now called, depends on many other conditions besides the rarefaction of the air. There must, of course, be a limit to the height at which active muscular exertion is possible; but we cannot say that it is ascertained. Perhaps Mr. Whymper's forthcoming report of the Andes may throw some light on this. Dr. Barry had a considerable inkling of the true state of the matter; for, noting the individual differences which even in his time were conspicuous in the symptoms observed in different ascents, he says:—"How far referrible to the condition of the system and how far to atmospheric changes is still uncertain." He made some attempts towards a table of comparative statistics on this question, but gave it up for want of sufficient data. He justly mentions, as examples of the accommodation of which the breathing organs are capable, the high inhabited tablelands of Thibet and South America; and his conclusion is that with which we must still be content—"The minimum of density at which this function would become, by habit, possible we do not yet know." Dr. Hamel's collection of facts, the fullest which had then been made (*Beschreibung zweyer Reisen auf den Mont-blanc*, Wien, 1821), does not seem to have been known to Dr. Barry. For his view from the summit Dr. Barry enjoyed the rare advantage of a sky perfectly free from cloud. Otherwise it calls for no special remark, save that it did not include the Mediterranean, though it did include the famous—and fabulous—Mont Iséran; but his enumeration leaves it quite uncertain whether the object shown to him as Mont Iséran was a peak or a col.

The other book of travels on which we have stumbled is less ambitious, more discursive, and in a general way more amusing to read. It is by Charles Joseph Latrobe, dated 1829, and entitled *The Alpenstock; or, Sketches of Swiss Scenery and Manners.* Mr. Latrobe spent two seasons in rambles about Switzerland, chiefly in the Bernese region, his base of operations being Erlenbach in the Simmenthal, where he seems to have established an intimate friendship with the pastor's family. There is little or nothing in the book of mountaineering proper, except a note of the ascent of the Jungfrau from Grindelwald in 1828. Mr. Latrobe incidentally gives the legend, now sufficiently exploded, of an ancient glacier pass from Grindelwald to the Valais, even specifying the year 1712 as the time when it was last open. In his own walks he shows an independent turn of mind, dispensing as much as possible with guides, and setting his face, even to open rebuke, against the shameless begging which had already become rife in the Oberland. In crossing the Col de Bonhomme alone he came near to losing his way, as many others have

done, and was right glad to find it again. He deserves remembrance as an early traveller who thoroughly enjoyed Alpine scenery, and would take some trouble to seek unhackneyed routes. The state of information of the English public at the time may be guessed by his thinking it needful to explain almost apologetically "that the Alpenstock is the name of the long iron-spiked pole, in common use in the Alps, in the hands of the chamois-hunter, the crystal-hunter, and the pedestrian traveller; and, therefore, not an unfitting symbol of the pursuits of one of the latter class."

We have made passing mention of the primitive or prehistoric stage of Alpine literature, and we shall end by citing a monument of it which we believe is not generally known. Almost at the end of the eighth volume of the *Philosophical Transactions*, in the number for February 9, 1673-4, is a communication concerning "the icy mountain, called the Gletscher, in the Canton of Berne, in Helvetia," said to have been "imparted to us from Paris by that worthy and obliging person Monsieur Justel, who had received it from a trusty hand living upon the place." It seems probable that the Grindelwald glaciers are meant; in 1708, at any rate, William Burnet (son of the Bishop) repaired to Grindelwald in person, and wrote a more particular account to Hans Sloane, which is printed in the Transactions of that year. M. Justel's report is accompanied by a most wonderful sketch, in which the ice-fall is represented by a conglomerate of pear-shaped lumps. It is impossible to do justice to it in words for the reader's satisfaction, or to identify any local features for one's own. He states that "the mountain itself"—*i.e.* one or both of the Grindelwald glaciers—"is very high, and extends itself every year more and more over the neighbouring meadows, by increments that make a great noise and cracking." He adds that "there is such another mountain near Geneva and upon the Alps," which may be taken, we conceive, as one of the earliest specific notices of Mont Blanc made with a scientific intention. Burnet's letter of 1708 shows a certain advance; he distinguishes the upper and the lower glacier, though not very lucidly. "There I saw," he says, "between two Mountains, like a River of Ice, which divides itself in two Branches, and in its way from the top of the Mountains to the bottom swells in vast Heaps, some bigger than St. Paul's Church." He was told that the glacier increased and decreased for alternate periods of seven years; "but I doubt," he judiciously added, "their Observation is not exact, and I suspect that they say it, to seem to know something singular." These papers (together with a still earlier notice communicated to the Royal Society in 1668, No. 49 of the Transactions) should find their place, if they have not done so already, in the bibliography of glacial theory.

ONE'S HOUSE IN THE MARKET.

It is the common experience of the buyer to find a dear market, and of the seller to find no market at all. Perhaps few people realize the truth of this paradox more than those who seek for a residence or have one which they wish to dispose of. The newspapers may be full of tempting advertisements, and the house-agents' books have numerous opportunities to offer; but it is found that the only suitable tenements are valued at a higher rate than that which the house-hunter is prepared to pay, whilst experience soon teaches him not to expect much of the "bijou residences in Mayfair," or the "roomy houses in the Regent's Park," that are offered to him on such modest terms. No good things grow on gooseberry bushes except gooseberries, and even they can be acquired only at the cost of many pricks. By dint of much perseverance and fatigue a house may in time be obtained more or less of the desired pretensions; it is only when it is proposed to part with it that the difficulties of the house market fully assert themselves. They do not, to be sure, become apparent at once. The trouble taken in the acquisition of a house does not lead its owner at first to anticipate the slightest difficulty in getting rid of it. Indeed there is possibly a latent conviction in his mind that many people are already covetous of inhabiting it. The situation is so good; either so near the Park, or so handy for the British Museum. The living rooms are so comfortable and well-proportioned, the bedrooms so airy, the drainage and decoration so equally perfect. It is, in fact, a gem in its way—kind friends have, indeed, now and again so styled it, and it is thought, therefore, that a few hints to these may be sufficient to secure an immediate deal. The kind friends, however, when it comes to the point, are found to be self-denying, and do not avail themselves readily of the chance offered them. The weeks slide by, and after all no eager purchasers appear to be vying with each other for the possession of the treasure. When once this untoward fact is fully recognized some little further advance is made. Good wine, to be sure, needs no bush; but nevertheless a few neat handbills timidly peeping from the dining-room windows invite passers-by to inquire within. The immediate result of this step is that curious passers-by avail themselves of the opportunity to explore the interior, without the slightest intention of acquiring the property, and a deluge of letters sets in from house-agents professing to have clients in search of just such a residence. The hope has probably been hitherto indulged that no agent need be employed; but, since weeks have sped without any fish taking the bait, it is thought advisable to seek his aid, let his fees be ever so exorbitant. No sooner is this done than swarms of persons bearing the unmistakably harried stamp of the genuine house-hunter invade the premises, but frequently with somewhat vague ideas of why they come. One day arrives a family who want a larger house than the one on view; another, some people who plead, almost *ad misericordiam*, that they require one at a less rent. For the first few days there is no cessation of callers. The door-bell and knocker are continually going, and the servants are run off their legs. The family in possession meantime live in a state of constant nervous excitement. All their rooms have to be kept in uncomfortable apple-pie order, ready for inspection at a moment's notice, and bevies of strangers are perpetually invading their privacy at most inconvenient times and seasons. They are buoyed up, however, by the assurance that, amidst so many persons admitted to view, there will certainly be some anxious to come to terms; and, indeed, so confident are they of this that they even contemplate raising their price. Such competition should obviously make a good market; and at all events they will stand out for their full price, and make no weak concession in the way of taking pounds instead of guineas.

Unfortunately, though "men may come," it is found that they also "go"; and, like the brook of song, the house "goes on for ever," or at all events does not go off. Various as are the classes of callers, they all seem actuated by a common determination not to treat. They go all over the house, some of them from garret to cellar; they ask numberless questions, and appear to be satisfied with the answers they receive; they even send their friends and relations in different relays to confirm their opinions; but, after a while, are heard of no more. A pair of lovers come one day, and smirk playfully at each other on the staircase, or kiss surreptitiously in the conservatory. They express a honeyed approval and admiration of everything. Probably it is the first house they have looked at, and they care little or nothing what their house is, so they may have a dovecote as soon as possible. Two of the bride-elect's sisters arrive a few hours afterwards, full of sweet apologies for the trouble they are giving. They go all over the house, and are even more rapturous than the intending happy pair themselves. They are greatly taken with the conservatory on the landing, and point out to each other what a charming boudoir dear Angelina will make of the closet adjoining the drawing-room; whilst, should there be a Virginian creeper sprawling over the passage window, they declare "it looks quite like the country." They apportion the different rooms, and endeavour to compensate for the time they sacrifice and to ingratiate themselves with the householders by whispering audibly their conviction that it is "the very thing to suit Edwin." Next morning they come again with the bride elect, but accompanied also by their mother. They are as ecstatic as ever, and look anxiously to the elder lady for confirmation of their opinion, eagerly seconding the owner's explanation of the smell in the scullery, and accepting his views about the want of cupboard accommodation on the nursery landing. Mamma is less enthusiastic than the girls perhaps, and cannot agree that the high-art wall-paper in the drawing-room compensates for deficient servants' accommodation, or that the rustic fernery on the leads atones for the look-out over the livery stables; but no serious objections are made to the house, and the possessor hugs himself in the assurance that the place is as good as let or sold, as the case may be, since the ladies have taken a fancy to it. A week elapses, however, without further notice from this eager family, and the comforting assurance as to their obvious intentions grows cooler. The lovers are obviously impressed with the more tempered views of their elders or are flirting with some other house. One evening, however, Edwin turns up again, bringing "the governor" to look at his discovery. Perhaps the Virginian creeper and the *rus in urbe* over the cistern impress him less than they did the young ladies, but he is obviously anxious to settle on some home and have done with it. Angelina will be enough for his happiness, and he has no present anxiety about the kitchen range or the aspect of the night nursery. Paterfamilias, being of a practical turn and uncomfortably exigent about minor shortcomings, pooh-poohs the attractive drawing-room and stigmatizes the boudoir as "a mere cupboard." He cannot conceive where the man servant is to sleep; thinks meanly of the staircase; dubs the entrance hall utterly narrow and insufficient, and declares that he has no desire to see either the kitchen floor or the bedrooms. His remarks fill the wistful vendors with dismay, and when another week has passed without further visits from anybody, they begin to fear that their swan is after all only a goose. After a while a fresh tide of visitors suddenly sets in, the clients probably of another agent who has discovered that the house is to be disposed of. This second batch of visitors is, however, for some undefined reason even more hopeless than the first. An elderly lady calls in search of a house for an older lady still, who must certainly see it herself before anything is settled; but who, unfortunately, cannot be moved from Cheltenham. Then come the father and mother of a large family, who are only concerned about the accommodation offered, and care little for the convenience of the gas-stove, and nothing whatever for the tasteful wainscots of India matting. The sole question, they explain, is whether the house will hold them. As to that they are doubtful. They moon about from room to room, harried with anxiety as to where the girls are to sleep, and whether it will do to put the three boys in the dressing-room. They consult painfully with each other, and even take the wearied householders themselves into their confidence, expatiating on the necessity of baby sleeping within hearing of his mother, and on the inconvenience of the twins being girl and boy, an evil for which the householders express their sympathy, but for which they have no present remedy to offer. When all

these vexed problems have been settled to their apparent satisfaction, they again have a thorough inspection of all the rooms, and take their departure, to be heard of no more.

So many people have now tacitly decided that the house is not a gem after all, that the owner begins reluctantly to share their opinion. What had hitherto been his pride and joy he now regards with unwilling contempt, and, as he returns home of an evening, he positively loathes the sight of his own residence and of the handbills mocking his struggles to be rid of it. There is now some thought of a reduction of terms. The agent is told in the strictest confidence that he may hint at the possibility of an offer being accepted. As, therefore, four thousand guineas have been asked, the agent calls one day to say he has an offer of two thousand pounds; or the business-like gentleman who so deliberately poked about the plaster of the thin walls with his umbrella, and jumped heavily on the quivering floors, writes on one side only of some thin blue paper to ask bluntly what is the lowest selling price, pointing out that, as an investment, a leasehold property should pay seven or eight per cent., that he has many houses in the neighbourhood and knows the value of property in the district, that he could have bought the house next door a short time ago for 1,000*l.* and that he supposes the one in question would let for about 100*l.* a year. Another intending purchaser is willing to come to terms provided the drains are entirely reconstructed, or some impossible alteration carried out which shall provide the housemaid's closet with a fireplace and convert it into a smoking-room. Eventually the house is disposed of for about half the sum asked, and the distracted owners congratulate themselves that, if they have sacrificed money, they have purchased peace of mind. They are not yet out of the fire, however; for, before the purchase is completed and the agreement signed, the other parties to it suddenly insist on further stipulations which had not occurred to them before. The roof must be inspected by a competent surveyor, and an engineer cousin must be permitted to go all over the premises and give his opinion; moreover, unless the vendors will consent to leave half the purchase-money on mortgage at four per cent., the bargain must be considered as at an end. Bewildered and despairing, the householders consent to anything and everything, so that their health may not be shattered and their nervous system deranged by further worry. The surveyor therefore comes, and makes it his business to discover various flaws and faulty fittings; whilst the engineer cousin turns out to be a savant of three months' standing in his profession, who finds a splendid opportunity for displaying his knowledge in pointing out the absence of this, and the objectionable presence of that, to his wonder-stricken relatives. It is not till all the stipulations have been conceded—till, in fact, the deeds have been signed and the whole transaction closed at a ruinous sacrifice—that the young couple who first saw the house make up their minds that it is exactly what they want, and offer to take it out of hand at the vendor's price without any stipulations whatever, and are rather hurt that they cannot have it. When the various demands of the surveyor and the airy suggestions of the young engineer have been carried out there is only a rag of the purchase-money left to the unfortunate householder; but the agent will take care to deduct at least two and a half per cent. from even this remnant as it passes through his hands, and the transaction will perhaps lead his much-suffering clients to wonder what services have been performed for the money. On reflection it will occur to them that they themselves have undertaken all the worry and trouble of showing people over their house, and that they have answered all advertisements from persons seemingly in want of such a residence. House-seekers, to be sure, have called, invited to do so by a perusal of the particulars in the agent's book; but on themselves has fallen the difficult task of puffing their own goods. It is hard, they feel, that they should not only have had to pipe, but also to pay the piper. In the present overcrowded state of the liberal professions, young gentlemen of good manners and appearance in search of a calling might do well to turn their attention to the career of house-agency. They should be well primed with all the advantages of a house, and should have a prompt answer to every possible objection. They should be ready, moreover, to impersonate intending purchasers themselves, so that *bonâ fide* but wavering house-hunters might be goaded to a final decision by the apparent desire of the well-dressed young man, with an order in his hand, to take the place, and by his expressed intention to write to the agent by the evening's post. Nay more, his sisters and his aunts might fulfil a like mission, and even their children might be pressed into the service, and represent the darlings of an intending tenant. It is wonderful how the fact of another person being in treaty stimulates the zeal of a purchaser, and tends to conclude a bargain; and a whispered announcement that "the house will certainly do" from our family of departing dummies in the doorway might frequently be found to produce at least an offer from a tempted but hesitating house-hunter on the stairs.

NAPOLEON'S FIRST BATTLE-FIELD.

A RAILWAY is now open in North Italy which not only offers the straightest and shortest line from Paris and Turin to some of the most beautiful spots in the Western Riviera, and includes a new passage through the charming scenery of the Apennines, but has the merit of leading the traveller through a region which cannot easily be surpassed in historical and military interest. The line is one which, starting from Turin, divides into two branches—one passing through Alessandria, as far as which place it is identical with the main line from Milan to Bologna or to Genoa, and the other through Cherasco; these branches climb the Apennines by distinct routes from the north, unite near the summit of the Pass of Cadibona, as it is sometimes called, and together descend upon Savona, where they join the well-known line which connects Genoa with Nice. Savona is an interesting and picturesque town, about five-and-twenty miles west of Genoa, and has an excellent hotel. The spot where the two branches join is the exact centre of the operations which, in the month of April 1796, first disclosed to the world the energy and genius of General Buonaparte.

It was the moment in the history of the great Republican struggle against the forces of Europe when the agony of the first resistance was over, and with it had begun to vanish something of the heroic mood which makes Frenchmen still kindle at the names of Hoche and Joubert. The enemies of France had diminished in number and slackened in force. Prussia had come to terms; Spain was almost friendly. England, it is true, was still at war; but it was a war without fighting, since the one country was too strong to be attacked by land, and the other was invincible by sea. There remained only Austria and Piedmont; Austria, which was fighting for her Belgian provinces, and had not yet begun to realize that they might be more valuable to offer as a bargain than to hold as a dominion, and Piedmont, which could not then bear to part from its beloved Savoy. Thus both in the Netherlands and in Italy hostile armies were facing each other. But in 1795 the war had languished. The troops of France held the southern passes of the Maritime Alps and the ridges of the Apennine mountains, along which they had been able to push nearly as far as the then independent territory of Genoa; but they were held in check by the Piedmontese fortresses on the one hand and the Austrian armies on the other. Lombardy was then Austrian territory, and the armies which half a century later clashed mortally at Novara were now combined to prevent the Republican forces from pouring down from the barren mountains upon the level tracts—the promised land, as their leader styled it, to which warmth and food invited them quite as strongly as the desire of military glory. It was as far as Savona, or a little beyond it, that the French lines extended. A northerly movement towards the plains of the Po would bring them on the left against the Piedmontese under Colli, on the right against the Austrians under Beaulieu. Napoleon Buonaparte, aged twenty-six, hitherto known only for the success of his advice in the siege of Toulon and the energy of his action against the Parisian rising of the sections, had just been appointed by the Directory to the command of the army of Italy. It consisted of certain detachments placed among the mountains north of Nice and north of San Remo, and of something less than thirty thousand ragged heroes under his immediate command. They had little food and no pay. The young commander delighted his divisional generals by the munificent gift of four louis apiece.

The main chain of the Apennines near Savona runs, roughly speaking, parallel to the coast in a north-easterly direction, and at a distance of from ten to twenty miles from the sea. From the main chain there stretch northward lateral ridges at intervals of about ten miles apart. The valleys which separate these ridges ultimately meet and drain into the Po; the ridges themselves are tumbled and broken, sinking in gaps and rising into peaks here and there difficult to climb, but in the main easy enough for a traveller on foot. There are but few roads connecting valley with valley; in 1796 there were hardly any, and the population was thinly scattered. From Savona a road and railway now ascend towards the main chain, cross it by an easy pass about as high as the average of the English Lake mountains, and debouch upon a small upland plain at the head of one of the branches of the Bormida River. Here both road and railway separate. The Cherasco line keeps westward so as to mount across a gap in one of the northward parallel ridges just spoken of, and descend upon another and parallel Bormida at the little town of Millesimo; the other line of road and rail turns northward down its own proper valley, and descends by Cairo and Dego towards Acqui, before reaching which it is joined after long separation by its sister Bormida. The upland plain at which the roads separate is the plain of Carcare; the railway station, a mile north of Carcaro, is that of San Giuseppe di Cairo; and the gap across which the road passes westward over the intervening ridge towards Millesimo is the gap of Cosseria, so called from an old ruined fort which commands it on the northern side from a conspicuous peak of rock. Thus there are two parallel valleys, which we may call those of Millesimo and Cairo, or the western and eastern Bormida, respectively; but the Millesimo valley has no pass at its head by which it can clear the main chain, and in order to reach the coast the traveller must cross by the Cosseria gap into the Cairo valley, and then proceed to Savona by the principal pass which the railway follows. Such is now the position of things; the only difference eighty years ago being that neither road nor railway then existed, but only rough bridle-tracks along which field-guns were with difficulty dragged. An actual road, however, did exist, which quitted the Cairo valley lower down at Dego, passed eastward across its lateral ridge, and then mounted over the main chain at a moderate depression existing about eight miles east of the principal pass, and finally reached the coast at a little distance from Savona. This depression we will call the Old Pass.

It was from the head of this Old Pass that news reached Buona-

parte on the 11th of April that his outposts were being attacked by the right wing of the Austrian army. Their left wing had on the previous day manoeuvred in some force along the coast, and two large masses were closing in upon him among the mountains. A devoted colonel was holding a few small fieldworks near the Old Pass, and demanded instant support. The young French general determined to give it at all cost. He left the sea-coast to take care of itself, withdrew his divisions from before the Austrian left, and combined two-thirds of his force for a resolute attack on the enemy upon the Apennines, while the remaining division, that of Masséna, was despatched across the Carcare uplands, by what is now the main pass, to penetrate by night to the extreme Austrian flank and attack them from the north and west. There exists no detailed records of the march or combat; but Masséna was just the man for the work. While the main French force was engaging the Austrians on the hill-tops, Masséna struck quickly and fiercely at them from the rugged districts east of Cairo. They gave way, and fell back upon Dego, down in the eastern Bormida valley. This is scene the first of the drama; it is known as the battle of Montenotte. No town of Montenotte exists, except indeed upon the maps. At best there are but a few houses, but the name is locally given to the rough mountain tract which lies to the east of Carcare. Scene the second introduces the Piedmontese. While Austria had been attacking from the north and east, Piedmont had been closing in from the north-west; the army of Colli had been massing itself in the Millesimo valley, and was in command of the Cosseria gap and fort. Thus the victorious general had enemies in front of him at Dego and on his left at Millesimo; but the two were separated by a high ridge of mountains, and practically incapable of united effort, while he himself could fall upon either of them at his pleasure. It is exactly the position which an enterprising general loves, and which Napoleon so often made for himself. If geography had made it for him nineteen years later—if, after the success of Ligny, an impassable ridge of hills had stretched northwards from Quatre Bras to Brussels; if the heights between Wavre and Mont St. Jean had been two thousand feet high instead of two hundred—then Waterloo, if fought at all, would have had a different ending.

In the first place, the army of Beaulieu must be beaten off for good. Down the valley of Cairo the Republican soldiers forced their way, met the enemy as he tried to hold his ground at Dego, and forced him down the gorges of the eastern Bormida beyond hope of rally. A young officer distinguished himself in this encounter; he was made colonel on the field of battle; ten years later he was Marshal Lannes. And when the success of Dego was secure, and not till then, Buonaparte recalled his victorious troops, and sent them to help the one division which meanwhile, under Augereau, had been holding head to the west against the Piedmontese. Colli, as we have said, was in force at Millesimo, and he held the position of Cosseria, which commands the lateral gap. Night closed as the conquering Frenchmen streamed across the ridge and surged round the old ruins of the fort. It was a terrible obstacle if held by determined men; and Provera, who was in charge of it, was a gallant officer. Rising high and steep directly above the gap, and dominating it by some five hundred feet, it was far beyond the reach of field artillery; and its conical sides, as the assailants mounted them, were swept by the fire of musketry from the old walls and ploughed by the huge stones which, as it were in memory of barbaric battles, the defenders rolled down from above. Here, indeed, was the crisis of the five days' campaign. Joubert had been struck down in the assault; and, as the night darkened, even the daring of the Republican battalions failed them. One may stand upon the stones of the little fortress, which still remain much as they then were, and wonder that any soldiers should have dreamt of storming the position. But, if it were not carried within twenty-four hours, Colli would have time to draw his main body off, a junction would be arranged with Beaulieu far down in the plain, and the united armies would once more encounter their assailants with superior and probably overwhelming strength. Next day came, and the struggle for the ruins recommenced. All day long Provera, with his two thousand soldiers, crowned the low walls, and held the French at bay. By nightfall, overcome with sheer exhaustion and in despair of relief, he gave way, and the conquerors poured down without check upon the now abandoned Millesimo. Colli had fallen back, not now to join his Imperial allies, but towards his own base at Ceva, to which indeed the road, such as it was, conducted him; and Piedmontese and Austrians were separated to join no more. Buonaparte pressed Colli, and beat him again and again; a fortnight more, and Piedmont had concluded a separate treaty with the Directory, surrendering the chief passes of the Maritime Alps, which now became the main line of French communication, and the principal fortresses of the western plain of the Po. The young general had now a secure base for the operations which rendered for ever famous the first campaign of Italy.

Standing on the crumbling walls of the old fortress, one finds plenty to see and to think about. There is a view unsurpassed even in the Apennines; a magnificent panorama of hill and rock, stretching northwards over the valleys that sink towards the plain, and southwards towards the heights of the main chain. The works of the little fort cover a space some two hundred yards in diameter; its slope is clothed here and there with brushwood, while in parts it is almost precipitous; cottages and churches lie among the corners and on the peaks of the hills beneath. To the west, beyond all, rises the superb snowy wall of the Western Alps, visible from end to end, with Monte Viso standing as a giant castle in their midst. Then one thinks of the moral of the story. Whether it is Beaulieu and Colli in Italy, or Wellington and Blücher in Flanders, whenever two armies are working together, the point of junction should be made the strongest point of all; a single check, and the beaten force finds an almost irresistible tendency to retreat towards its own base, and leave its companions to themselves. And, lastly, there is the almost unique personal interest connected with the spot. There was daring at Lodi, there was genius at Arcola. But it was not the marshes of Arcola, still less was it the bridge of Lodi, which first opened the door to the greatest military career in history. It was the little hill and dismantled castle of Cosseria, one hour's walk and climb from the Millesimo station of the new Turin and Savona Railway.

CHURCH-HUNTING IN SUSSEX.

THE hard-worked Londoner when he goes for a holiday too often takes his London surroundings with him. Nothing is more difficult than to idle systematically and seriously. When the philosopher sits by the sad sea shore he is too likely to speculate on the forms of water and illustrate his views on the wave theory. The artist cannot help making small sketches. The novelist watches the young people as they stroll in the sunset along the sand, and weaves plots. And so it comes to pass, over and over again, that a party ostensibly gathered in a country house to make holiday, after a few weak attempts at doing nothing, settle down to the regular employments of town life. The dry treatise, so forbidding among scenes of excitement, can then be mastered. The picture, laid aside for a few days, forces itself anew upon the attention. The halting verses form themselves into regular order, and rhymes come unbidden to the music of bees and rustling leaves. The student, the artist, the poet, are all soon hard at work, and the town parson, if there be one in the company, is driven abroad to search for unrestored churches, to copy punning epitaphs, and revise his list of dated mouldings. But the ecclesiologist of to-day is a very different being from the ecclesiologist of thirty or even twenty years ago. His sympathies come down to a period very much more recent than the thirteenth century. He openly professes a regard for Inigo Jones, and can admire Wren on occasion. A good piece of Stuart panelling fixes his attention more surely than decorated sedilia. The Lombardic character has no charms for him in comparison with a punning but pious epitaph of Cromwell's time. He copies the early entries in the parish register, though it goes no further back than the beginning of the seventeenth century, and asks anxiously after Georgian forms of special prayer. He looks with wonderful tolerance on pewing, and insists on stripping off the altar-cloth in hopes of finding an Elizabethan oak table. He has a strange habit, too, of carrying a guide-book with him always, but not for the purpose of consulting it. Guide-books do not contain the kind of information he seeks, but he uses them to find out what has not been noticed. When the guide says such a place is not worth a visit, thither he wends his way; and true happiness is his when he discovers a region unknown to Murray and Stanford. Churches mentioned in the books are to him what editions unnoticed by Lowndes are to the bibliomaniac, or a new old fossil to the geologist.

His ideal of the happy hunting-grounds may perhaps be found in the delta of the Arun. He has an eye like a huntsman's for "a country," and observes at once that behind the coast line which stretches from Bognor to Worthing, or about ten miles on either side of the mouth of the Arun at Littlehampton, there is a depression which, not long ago, as an old map tells him, was a swamp. Between this and the sea are a number of very small, very old, and very pretty churches. The parishes are microscopic in their minuteness, as they are in Essex near the coast line, pointing probably to an early and dense settlement of the immigrant Saxons, and by consequence the churches are numerous. Within a few miles he finds church after church—discovers them, as he puts it—on which no archaeological papers have been read, and of which no handbook notices more than the name. He sets steadily to work, looking forward, as his note-book gradually fills, to happy hours with Dallaway in the Museum on his return to town. After all, it is to town, and to what may be done in town, that his thoughts involuntarily turn. Two mornings spent in enforced idleness on the sunny lawn, two afternoons devoted to young ladies and tennis, and he breaks away to accumulate the notes which are to form a solace in the intervals of next winter's work. He passes Clymping with a sigh, Clymping of which he has heard so much. Its almost Doric simplicity, the plain lancets, the solid effect of great spaces of blank wall, the unusual slope of the roof, all are points of momentary interest only. Clymping has been "done." Clymping has attained celebrity. It has been "thoroughly restored"; but even this does not interest him. The curious niche in the tower with its zig-zag mouldings seems to him to have no look of age left, and he refuses to accept as ancient what, he asserts, is but a modern architect's interpretation of ancientness. But at Ford he warms up. Though the place is in the books the church is hardly mentioned. It stands in a low meadow surrounded by wooden fences. There is no road to it, only a grassy pathway. Small as it is—so small that a neighbouring house seems to tower above it—every style of English architecture seems to have left a mark on it. There are Norman features in the little round-headed windows of the chancel. There are first pointed

lancets, and "cottage-headed" windows besides, and, most interesting of all, there is a porch, which contrasts in its ruddy mellowness of lichen-coated brick with the grey flint walls of the older building, as well as in its curved gable, speaking of the "restoration," which, we are told, took place in the days of Archbishop Laud. Not half a mile further is Tortington, almost surrounded with the woods which here put forth an arm from the neighbouring park at Arundel. The Priory of St. Mary Magdalen has disappeared, and the vicar, who used to have "corrody" for himself and his servant with the canons, now lives in the neighbouring town. The church is full of objects of interest, though scarcely larger than Ford, the chief feature being the chancel arch, so often described and figured as an example of the grotesque ornament of the later Norman style. The church-hunter is perhaps not as much impressed as he ought to be with the beauty of the wild road which leads him thence to Arundel through avenues of overhanging trees and dense brushwood, from which bright eyes watch him as he passes, and merry young rabbits dart across his path, little knowing or recking that over their future prospects the nobles and rulers of the land are in anxious deliberation up at Westminster. He does not long delay at Arundel. Is it not fully described in numberless books? The new Romanist church, not long finished by the Duke, impresses him favourably from a distance, but unfavourably on a nearer view. The situation is magnificent; but the architect, wishing perhaps to make the most of it, has made too much. Obtrusive, vulgar, are the adjectives which rise to our ecclesiologist's somewhat prejudiced lips, and when he visits the interior the chromolithographs on the walls and the decorations of the altar make him add the word "tawdry." Of the parish church he has heard too much lately, and hurrying down the hill and across the bridge, he seeks once more the thickly strewn churches of the coast.

Leominster, in spite of its high-sounding name, does not keep him long, for it is both thoroughly restored and well described. At Rustington he pauses. The lych-gate at a corner of the churchyard, the two wooden porches with their massive oak beams, the transitional Norman windows of the tower, the frequent lancets, give the place a great charm in his eyes; nor does the interior disappoint him, with its numerous tablets and the fragments of one very ancient monument, perhaps of one of the Bohuns, whose co-heiresses divided East Preston and Rustington, or West Preston, between them some time in the twelfth century; but he seeks in vain for any memorial of Thomas Baker, who was "of Rustington," and whose grandson, the great John Selden, probably often sojourned at the manor house on the other side of the road, now a rather shabby-looking farmhouse. At East Preston he is told by a villager that the church is the oldest in the country, a statement which he receives at first with incredulity, but an inspection of the chancel, which was invisible from the road, justifies it. The little round-headed windows date from the very beginning of English architecture. Angmering looks too fresh to attract him, though there are features of interest in it which even a virtual rebuilding thirty years ago has not obliterated. The name of Shelley draws him towards the hills. There are Shelley memorials to be seen at Clapham, and thither he directs his steps, stopping on the way for a few minutes at Patching. The names are not so euphonious on the hills as in the valley below, but the landscape is more than enough to make up for it. Call a place by an ugly name, but if it is situated on a well-wooded slope, with bare downs stretching away into the blue haze behind, and the sea sleeping in the sunshine beyond the green plain in front, you may speak of it as Clapham or Patching or Michelgrove or Angmering without much damage to its pleasant associations. Patching had once a shingle spire and a north aisle; but a tablet over the door records the gratitude of the parishioners to a certain Sir Richard Hunter who "repaired and beautified" the church in 1835. To him, probably, we may attribute the whitewashed ceiling, half hiding the roof-beams, and the thick coat of yellow paint which covers the pulpit. This pulpit is a joy to the modern ecclesiologist. It is of the ordinary wineglass pattern, but worked into it are five panels, in which thick coats of paint cannot disguise the exquisite carving or the Holbeinesque design. What is the Perpendicular choir-screen, what the curious double miserere seats, to this series of panels? But the day is waning, and hours would not suffice to copy patterns as intricate as an ornamental engraving of Beham, and the town parson rushes off to Clapham. There is a steep hill down and a steeper hill up through a village street of cottages too well built for picturesqueness, and he turns in at a gate and across two fields to a wood through which the pathway climbs the hill. On his right is a picturesque farmhouse of considerable antiquity, and immediately before him, half hidden among the oaks, is the church. It somewhat resembles Clymping; but its Early English features are many of them the result rather of a recent "thorough restoration" than the genuine article. He cannot but admire the western lancets from under the new lych-gate, and can well believe it when he is told that at the opening service after the restoration the music within was answered by the nightingales without. In the churchyard on the left is a monument to the mother of that genial novelist, Frank Smedley, but memorials of greater literary interest are within. In the centre of the nave, just below the chancel step, is a brass in exquisite preservation. It was long hidden away under the pavement, to which fact its preservation intact may perhaps be attributed, for the curious and delicately designed representation of the Trinity between the figures could not long have survived a Puritan visitation, however mild. In 1526 the knight Sir John Shelley died, having married Elizabeth, the heiress of the Michelgroves, to whose inheritance he owed his transplantation into Sussex out of Kent. The Michelgroves had themselves come from Kent, where they had figured as Fauconers of Fauconhurst, and though they changed the name, the hawk remains on the coat-of-arms which the lady wears in brass. From her second son descended the poet, who was born at Field Place, a few miles off across the hills. The Shelleys continued at Michelgrove till the beginning of this century, and the chancel is full of their tombstones. There is the judge, with his wife and his children, *in alto rilievo*, under a canopy, and there is the epitaph of his wife's sister, "Bona et virtuosa Greisildis," wife of John Caryll. The Carylls were seated at West Grinstead, and it was to one of them that Pope dedicated the *Rape of the Lock*—"this verse to Caryl, Muse! is due." It is curious, by the way, to observe, that among the Shelleys' nearest neighbours were the Westbrooks, a good old Sussex family, one of whom was Governor of Cyprus in the seventeenth century.

BAMPFYLDE MOORE CAREW.

It is probable that few of the readers of Lever's novel, *Sir Jasper Carew*, are aware that he is indebted, both for the name of his hero and for some of the leading incidents of his story, in some degree to actual fact. Most people have heard of Bampfylde Moore Carew, but comparatively few perhaps are acquainted with a choice work "printed for the booksellers," and containing "many entertaining particulars of that extraordinary man," who, according to the author, was born in the year 1693, being "descended from the family of the Carews." His father, we are moreover told, was the Reverend Theodore Carew, of Bickley, near Tiverton. Very fondly does the biographer dwell upon the rank and splendour of the guests assembled at the baptism, and he descants lovingly upon an amicable dispute as to who should be president which took place between the two godfathers, "doubtless presaging the honour that should redound to them from the future actions of our hero." A description of Bampfylde Carew is then ushered in with a mighty flourish of trumpets, and we are informed that he was "tall and majestic," and that his countenance bore the marks which denote an "honest and good-natured mind." That we may judge for ourselves, we are referred to his portrait, which is given at the beginning of the book; but as this artistic production presents only a back view of "our hero" kneeling to two savages, we are unable to bear testimony to the accuracy of the statement. "Good-natured" he may have been, but his claim to honesty must certainly be set aside if we are to judge him according to any received standard of morality. At school he seems to have made rapid progress in his studies, but to have soon abandoned them for the delights of hunting and field sports of every description. At this period of his life he discovered "a remarkable cheering halloo, which was peculiar to himself," and found out a secret of enticing all manner of dogs to follow him. This last accomplishment proved afterwards of the greatest service to him in his adventurous life. Getting into trouble for hunting a deer which was a neighbour's property, he ran away with a few chosen companions and took refuge with a company of gipsies who had fixed their camp in the neighbourhood. About gipsies in general, and those with whom Carew fell in in particular, our biographer waxes marvellously eloquent, ending with this astounding proposition:—"Whether the divine Homer himself might not have been of this society will admit of a doubt, as there is much uncertainty about his birth and education, though nothing is more certain than that he travelled from place to place." Carew, however, got on amazingly well with his new companions; and, owing to the skill he exhibited in dog-stealing and in persuading weak-minded old ladies to part with their money, he soon became a personage of no small importance among them. Then, too, he developed a remarkable talent for disguising himself and adopting the sentiments and manners of those whom he sought to imitate in his outward appearance; so that he managed to get together a considerable sum of money in a short time by travelling about in the character of a shipwrecked sailor or a small tradesman who had lost his all by fire. His family wasted much time in vainly entreating him to return to his home and to civilized habits; for it was now, according to the writer of his adventures, "that he reflected on that grand and noble axiom of life, that we are not born for ourselves only," and that he was therefore bound to do his utmost for the welfare of the community with which he had cast in his lot.

Accordingly he hit upon the capital expedient of ranging through the country as a lunatic, "carrying it so far as to address himself to all the posts in the streets as if they were saints, lifting up his hands in a fervent though distracted manner to heaven," and on one occasion extorting money from a clergyman by seizing him in the street and "insisting in a raving manner he should tell him who was the father of the morning star." It is not a little curious to find how well lunacy used to pay those who feigned it in Carew's time; for, according to the work before us, any man who wished money to be showered on him had only to tear his hair and break his neighbour's furniture in order to be richly rewarded. Moreover, sometimes when Carew's invention flagged, and he felt indisposed to go abroad, he would content himself with writing

begging letters, stating that he was a poor idiot, and the charitable never failed to send him money and provisions. In fact, he throve so well that he determined to marry, and being at Newcastle-on-Tyne he (under false pretences) induced an apothecary's daughter of that town to become his wife. He then took his bride-elect to Dartmouth, where he discovered to her that he was of the community of the gipsies; on learning which "she was not a little surprised and troubled"; but, on finding her husband's comrades were better fellows than she had expected, she became instantly satisfied; and set off with him for Bath, where they intended to pass their honeymoon. This they did in a decidedly original manner. Carew, who was a bit of a cynic, mixed for the first part of their stay with all the best company in the place, and lavished hospitality on all who approached him, till, growing weary of so much splendour, he once more disguised himself as an abject beggar, and took a grim delight in being thrust from the houses of the very people who had a few days before been hat in hand to him. Leaving Bath, he confided his wife to the care of some friends, and started off alone, armed with several new disguises, in which he made another very successful campaign.

Now occurred a most important event. The king of his community was dying, and all the subaltern beggars, Carew among the number, were summoned to his bedside. In spite of the good work done by the Charity Organization Society, it may not be useless to our readers to ponder over the last words of the dying monarch, for he is pretty sure to have more than one representative in modern London. In a touching speech he assures his "children" of his love, and tells them that he has been "so blessed in his profession" that he is enabled to leave a hundred pounds to each of them. "Take among you," he cries, "the maxims I have laid down for my own guide, and use them with as much success as I have done." Very instructive are these same maxims, and most cunningly interwoven with moral reflections. "Be not less friends," he begins by saying, "because you are of the same profession; the lawyers herd together in their inns, the doctors in their college, the old-clothes-men in Monmouth Street; what one has not among these another has. Remember this, and always people a whole street with objects skilled in scenes of different distress, placed at proper distances—the tale that moves not one heart may surprise the next; the obdurate passer-by of the first must be made of no human matter if he feels no part of the distress that twenty different tales have heaped together." "Trouble most, people who are most busy" is one of his chief rules; but he is large-minded and anxious for the public good as well as for the advantage of his own people. We are therefore not surprised to find him descanting upon the best means for ensuring free circulation in the thoroughfares of great cities. "Remember," he says in his address, "that the streets were made for people to walk, and not to converse in; keep up their ancient use; and whenever you see two or three gathered together, be you amongst them, and let them not hear the sound of their own voices till they have bought off the noise of yours." No doubt more wisdom would have fallen from the old man's lips, but he expired before he could end his exhortation; and Carew, elected king by the common voice, reigned in his stead.

Crowned heads are proverbially uneasy, and Bampfylde Carew was no exception to the rule. While his honours were yet new upon him, an unfriendly magistrate had him arrested and conveyed to Exeter, where he was sentenced to pass seven years in Maryland. No sooner had he arrived there than he attempted to escape, but was brought back to the ship's captain, who had an iron collar fastened round his neck to mark him as a runaway slave. Notwithstanding, he again escaped, and succeeded in gaining an Indian camp, where his collar was taken off and he was well treated. His biographer is great upon the Indians, whom he cannot praise too much. "The accent and emphasis of some of their words," he informs us, "are great and sweet, as Okoroeston, Shakamoton, Paguiffin, names of places, and as sonorous as any in Attica." Carew, leaving them, made his way back to England on board a ship belonging to one Captain Rogers; but having no fancy for being "pressed" on his arrival in an English port, he pricked himself all over with a needle and rubbed in a mixture of bay-salt and gunpowder, which, it appears, is an excellent recipe for counterfeiting the small-pox. As they neared Lundy Island he spent all his time in groaning heavily and wandering about in a blanket on deck to be ready for all emergencies, so that when they were boarded by a lieutenant from a man-of-war in Bristol Roads, and all the other hands were carried off, the officer, who had never had the small-pox, paid him handsomely to get him gone. Carew went off to Bristol to get his injured skin repaired, and to make ready for another campaign in England, on which he set out after a short interval, which he had filled by feasting with some of his subjects. He seems to have undertaken this tour rather for amusement than for profit, playing practical jokes upon old acquaintances, laying ghosts, and "chaffing" magistrates. But what chiefly delighted him was that he was enabled utterly to destroy the peace of mind of the bellman at Southmolton. This person had in some manner offended him, and Carew was bent upon revenge. It luckily happened that a gentleman who had just been buried was reported to walk the churchyard; and Carew, taking advantage of the story, hid himself behind the grave and awaited the bellman's advent. As his victim approached he raised himself "with a solemn slowness," seeing which, the quaking bellman fled through the moonlight, leaving his bell, which Carew seized as a trophy, behind him in his flight. This made a great impression on the townsfolk, and especially on the bellman, who took to his bed and did not venture to go on his night rounds for months afterwards. But his troubles did not end here, "for Mr. Carew, happening about a year afterwards to be in Southmolton again, was afresh insulted by the bellman, which made him resolve to give him a second meeting in the churchyard." On this occasion "he dressed himself in a black gown, put a great fur cap upon his head, and at the usual time of the bellman's coming repaired to the churchyard, holding in his mouth by the middle a stick lighted at both ends, at the same time rattling a heavy iron chain." This proved more than the bellman could stand, and he threw up his appointment and retired into private life, fully convinced that he was haunted by the devil. But, delightful as these amusements were, they were not profitable, and "our hero" finding his purse empty struck out an original and very paying line for himself. He went to Exeter, and "with a rough but artless air, and the behaviour of a sailor," asked for the king's officers, whom he informed that he belonged to a vessel which had landed a large quantity of run goods. By offering to reveal their place of concealment he managed to live grandly at the officers' expense for some days, besides getting a large present in money, and at the last moment he slipped away with his usual cleverness to practise the same stratagem elsewhere. But, lingering too long in Exeter, he was once more taken to America at His Majesty's expense, where, in spite of great difficulties, he managed to escape and make his way back to England. Notwithstanding his age he still continued his vagabond existence for a year or two more; but, some relations dying and leaving him their money, he finally resolved to build a house and settle down in the West of England, where he fared sumptuously every day until he died; having displayed throughout the course of a long life an amount of enterprise and ingenuity which might have made him eminent in any career he might have chosen. But, on the other hand, it is impossible to imagine Carew in any other capacity than that of King of the Beggars.

THE BREECHES BIBLE.

Most people probably are familiar with the name of the Breeches Bible, and many perhaps have taken the trouble to verify the fact that in the third chapter of Genesis the translators have rendered the word which in the Authorized Version is *aprons* by the term *breeches*. But we do not think we shall be far wrong in saying that not one person in a thousand knows anything more about the book than that it exists, is in black letter type, and is more or less scarce. That copies should be as rarely met with as they are is undoubtedly strange when it is considered that for nearly fifty years it was the version in common use for family reading in England, the first edition of it having been published at Geneva in 1568, and there having been subsequent re-issues of the book from the London press nearly every year from 1572 to 1616. Thus much may be learned from bibliographers, who, however, are not very trustworthy in their accounts of the origin of this version. The New Testament has been commonly supposed to be little more than a new edition of the New Testament published in Geneva in 1557; but Mr. Fry, of Bristol, in an elaborate article in the *Journal of Sacred Literature* for July 1864, has successfully shown that the Genevan Testament of 1560 is a distinct version, varying more from Tyndale's previous translation than that of 1557 had ventured to do, and being in all respects entitled to be called the standard edition of the Genevan version, as having been followed exactly in every subsequent issue of the Genevan Bible for half a century.

It is not our intention here to criticize this translation, or to compare or contrast it with the renderings in the Bishops' or Parker's Bible, which was first published in 1568, and was reprinted from time to time down to the year 1588, or perhaps later; nor again with the Authorized Version, which has held its place since 1611. It is only in point to mention that the number of editions and copies of the Genevan Bible issued during the half-century in which it was in use shows that it must have been much more widely circulated than any other translation, till it was finally supplanted by the Authorized Version. But there is one particular in reference to the Genevan Bible that has escaped the notice of bibliographers as well as of historians. And, as it is a matter of considerable importance in an historical point of view, and may meet perhaps with further elucidation hereafter, we venture to draw attention to it. Several editions of this Bible had been published, both at Geneva and in London, before the quarto edition of 1579 came out, "imprinted at London by Christopher Barker, Printer to the Queenes most excellent Maiestie." This edition of 1579 is distinguished from all that precede it by having inserted between the Old and the New Testament three leaves, the first of which is occupied by a short summary of the books of Scripture which fills the first leaf, and is printed in Roman type, and the last two printed in black letter containing "Certaine questions and answeres touching the doctrine of predestination, the use of Gods word and sacraments." As a mere matter of bibliography, it is surprising that these should not have caught the eye of any of the persons who have described the different editions of the English Bible. As a matter of fact, these remarkable questions and answers appear in every quarto edition of the Genevan Bible printed by the King's or Queen's printer from 1579 to 1615 inclusive. Their first appearance in 1579, and their disappearance after 1615, are alike remarkable. That no Genevan

version should have been published in England after the folio of 1616 is natural, when it is remembered that this version is full of Calvinistic notes, and that this is exactly the period at which Laud's influence on ecclesiastical matters begins to tell. But what is most remarkable is that there is no record of any prohibition issued to the King's printer against reproducing this work. It is true that James I. very much disliked the Genevan version, and purposely appointed translators to execute a translation which should supersede it. But even after the publication of the Authorized Version it is certain that the Genevan version would still have had a large sale amongst the Nonconformists and with the Puritan party in general. So that there cannot be the least doubt that it was prohibited and suppressed by authority. Any one who has read the marginal annotations to this book will cease to wonder that Laud's influence was used to suppress it entirely. The King's objection to it appears to have been founded principally on such notes as seemed to impugn kingly authority; but it is impossible to doubt that its suppression was really owing to the Calvinistic doctrine so distinctly propounded throughout both the Old and the New Testament. A specimen or two will suffice to give an idea of these annotations. In a note on Deut. ii. there occurs the following:—

> God, in His election and reprobation, doth not only appoint the ends, but the means tending to the same.

On 2 Kings iii. we have as follows:—

> God suffereth His Word to be declared to the wicked because of the godly that are among them.

Perhaps the most striking passage is that which appears as a note to the eighteenth chapter of Ezekiel:—

> Albeit God, in His eternal counsel, appointed the death and damnation of the reprobate; yet the end of His counsel was not their death only, but chiefly His own glory. And also, because He doth not approve sin, therefore it is here said, that He would have them to turn away from it that they might live.

The leading idea of all the notes, both on the Old and on the New Testament, is that of the indefectibility of grace once given. And consistently enough, to cover this view, all the passages about sacraments in the New Testament are explained away. Thus the words of institution in the Eucharist are represented as meaning "a true sign and testimony that my body is made yours, and by me your souls are nourished." In like manner, baptism is everywhere explained to mean the outward expression of the previous admission into the Church of children who were already members of the Church by virtue of having at least one faithful parent. Of course there was nothing unnatural in a Geneva Bible being thoroughly Calvinistic in the tone of its translation and its marginal annotations. Neither is it any subject for wonder that such a Bible should be in use amongst the Puritans of Elizabeth's reign; but its use will at least go far to account for the almost uniformly Calvinistic tone of all English divinity during the time of Elizabeth and James I. This was the system of doctrine adopted by nearly all the revisers of the Second Prayer-Book of Edward VI. and by quite all the reformers of Elizabeth's reign.

And now we recur to the leaves of questions and answers on predestination which were authoritatively inserted in all these Bibles from 1579 to 1615. We are quite able to understand their disappearance exactly at the moment when Laud's star was in the ascendant; and perhaps their disappearance is the first sign of the rising influence of the future Archbishop. But we regret to say there is no evidence to determine the authorship of this remarkable Catechism, or to show by what means it was originally foisted into an authorized edition of the Bible, and managed to hold its ground so long, through about forty editions of the book issued in about as many years. No one will be surprised that they should have originated in the archiepiscopate of Grindal, nor again that they should have continued through the whole of the primacy of Whitgift, Bancroft, and Abbot. But, as it is the most clear and naked exposition of Calvinistic doctrine that can be seen compressed into a small space, we will give a short epitome of it.

It begins with attributing all the existing variations in religion to the fact that all men do not believe the Gospel, which fact is in its turn accounted for by the assertion that such persons as do not believe are vessels of wrath ordained unto destruction. The justice of this is defended on the ground that all men have sin, and that it is of mere mercy that any are saved. The objection that people will abuse this doctrine to purposes of sin is met by the reply that it is not possible that the elect should be "without care to do well, or that the reprobate should have any will thereunto. For to have either goodwill or good works is a testimony of the Spirit of God which is given to the elect only, whereby faith is so wrought in them that, being graft in Christ, they grow in holiness to that glory whereunto they are appointed." The next question taken up is as to how one is to know oneself to be one of the elect. The answer to this is that it may be known by remorse of conscience joined with the loathing of sin, which those who have at any time once felt within themselves it is impossible they should perish. Those who do not feel these emotions, however, should not despair, because "God calleth His at what time He seeth good." The means He uses are His word and sacraments. The word is defined to be the Old and New Testament, the evidence for which is internal, and is to be judged "by the testimony of God's Spirit, whereby it was written, Who moveth the hearts of those in whom it resteth to consent unto the word and reverently to embrace it." This word must be preached that people may hear, whilst the office of the sacraments is to appeal to the other senses; "that, by sight, taste, and feeling, as well as by hearing, we might be instructed, assured, and brought to obedience." Thus Baptism teaches us to put on Christ, and the Lord's Supper is designed to teach the elect that Christ is wholly theirs. The Catechism winds up with a practical application, by way of advice, as to how to attain to a knowledge of the word. The advice given is to the effect that, as we at least twice a day receive food to the nourishment of the body, so we should read at least two chapters of the Bible every day, "in such sort that occasion thereby may be taken to speak again unto God by prayer as He in His word speaketh to us"; and that certain portions be committed to memory, whereby it will be found that the Scriptures are not difficult, "for God maketh them easy to such as in humility seek them."

We have already said that we possess no clue to the authorship of this Calvinistic Catechism. Its general resemblance to the Catechisms of the Assembly will be apparent to readers who are familiar with these two documents as issued with the Westminster Confession. But its existence in all the copies of the Geneva Bible, issued for so many years, supplies an important link in the evidence which connects the doctrines of the English with those of the Swiss Reformation. It accounts also for the traditional Calvinism of the Puritans who still adhered to the Establishment long after the indomitable energy of Archbishop Laud had succeeded in purging the hierarchy of the Church of England from its influence. And we are not without hopes that this notice may be the means of drawing attention to the point, and so perhaps of eliciting some useful information as to the authorship of the Catechism, and the methods adopted in giving it so wide a circulation and securing it so large an influence over the belief of the people of England.

THE THEATRES.

At every re-opening of the Lyceum Theatre Mr. Irving is expected, as a matter of course, to say a few words to his audience at the end of the performance—a custom which pleasantly marks the cordial relations between the actor-manager and his spectators. In his short address delivered last Saturday night after the first performance under Mr. Irving's management of *The Corsican Brothers*, he commented upon the extent to which the preparations for the play had interfered with his holiday. So far as stage management in its widest sense is concerned, there can hardly be two opinions as to Mr. Irving's trouble being well repaid by the contentment of his audiences. Nor is it likely that his choice of the actors and actresses who figure in this play will be found to be anything but wise after the first few nights of representation. The play itself and some of the traditional "business" associated with it are perhaps more open to question. The piece is, in fact, less a connected drama than a sketch of a peculiar kind of life brought into strong relief by a supernatural element. That the distinguished player and manager who rules the Lyceum is right in varying Shakspearian performances with pure melodrama we have little doubt. Melodrama, as a contemporary critic has well pointed out, has a distinct and valuable place in stage literature. Whether *The Corsican Brothers* represents the best type of melodrama is another question, the full discussion of which would take us too far away from the consideration of this particular representation of the play. Whatever may be urged against the construction of the piece, the fact remains that it contains exceptional opportunities for scenic display and skill, and, which is more important, some singularly strong "situations." The double character of the two brothers affords perhaps less scope for the actor's powers than do, for instance, the double characters of Lesurques and Dubosc in *The Lyons Mail*; but, on the other hand, there is nothing in *The Lyons Mail* which affords the player so fine a chance as that which is found in the last scene of *The Corsican Brothers*. To a certain extent, the last scenes of both plays are similar; that is, in both Mr. Irving—and probably every one of his predecessors—has found his happiest moment. But it must be admitted that in a general point of view the Dei Franchi twins are worse acting characters than the supposed villain and the supposed man of exemplary character whose strange resemblance to each other gives the chief interest to *Le Courrier de Lyons*. Louis dei Franchi is in the novel of *Les Frères Corses* a strikingly fine character, but his appearance in *The Corsican Brothers* is so brief that there is but little opportunity for the actor to mark at once the difference and the resemblance between his twin brother and himself. What opportunity there is was made the most of by Mr. Irving, and one speech, that in which he announces his devotion to Mme. de Lesparre, even to "the last drop of his heart's blood," was given as well, as finely, and as strongly as possible. It has been thought that there was some shortcoming in the actor's representation in the first act of the other twin, Fabien; but to us it appeared that his performance in this part of the play was, if anything, unexpectedly true and skilful. He indicated, as it seemed to us, the naturally frank and manly character of the Corsican, who delights in an open-air life, and marked to just the right extent the effect upon a nature of this kind of a haunting and, according to his views, unerring sense of coming misfortune. In more than one speech the sudden remembrance of this shadow, overclouding a natural lightness of heart and demeanour, was marked with a singularly fine perception and execution. In this scene, as in others, the art with which Mr. Irving gave an air of excellence to dialogue which has in itself

but little merit was remarkable. Whether the actor is right in giving so deep an air of gloom to Louis dei Franchi, the twin who is studying in Paris, may be doubted; and it is possible that in the future he may think it well to modify the somewhat heavy melancholy which puts him in strong contrast to the *viveurs* with whom he is associated at the masked ball.

It is in the last act that Mr. Irving finds his best chance. It will be remembered that Château-Renaud's carriage has broken down in the forest of Fontainebleau just in time to bring him face to face with Fabien dei Franchi, the avenger of his brother's death, dealt to him by Château-Renaud's sword on the very spot where, by a fatal coincidence, Fabien and Château-Renaud meet. Mr. Irving has throughout this scene the air of a man implacable, bent on his purpose, and assured of his destiny. There is no passion in his voice, his look, or his gesture, as he speaks to and fights with his adversary. Rage and sorrow have spent themselves when he first was told, by supernatural means, of his brother's death. All that remains is a fixed determination to slay the slayer. The cold hard glitter of Fabien's eyes, the constrained ring of his voice, the set of his mouth, and the deadliness of his whole aspect, make one understand the strange conviction of a sure-coming death which seizes on Château-Renaud, one of the best swordsmen in Paris. The fight between the two is admirably managed, and shows well against the background of pine-trees lighted by the rising winter sun. (One critic, by the by, appears never to have observed the fact that, as far as light alone goes, early morning and late evening effects are precisely similar.) Fabien contents himself with parrying Château-Renaud's hot attacks, and makes frequent use of the parry of *prime*, a parry which is almost as useful as it is showy, and which has in many fencing-schools fallen into undesirable disuse. Mr. Irving has never fenced so well on the stage as in this duel, and he can find precedent for the vicious, if effective, attitude which he assumes on guard, with his left hand resting on the hips, instead of being used, as it should be, as a counterweight. Mr. Terriss also deserves high praise for his fencing in this scene, and, to our thinking, for his acting not only in this scene, but throughout the piece. His part is not very long, and is very difficult, and it seems to us that he gave with singular skill the idea of a man of gentle breeding who is also a man capable of and given to actions of which a gentleman should be ashamed. His bearing was throughout effective, and in the final scene of the duel there was much force. The minor parts were more than capably filled, and Miss Pauncefort, Mr. Pinero, and Mr. Mead deserve special praise.

We have spoken of some "traditional" business connected with the piece which may seem out of date, and we may refer especially to the "sliding trap" employed for the ghost. This does not strike us as particularly effective; but, on the other hand, innovation might have been dangerous. In other respects the mounting of the piece is at once magnificent and artistic. The first and last scenes are models of scene-painting in the line of landscape, and the scene in the Opera House is to the same extent a model of technical stage arrangement, in which the scene-painter's skill takes another, but in its way an equally admirable, shape.

Mrs. Bateman's spirited production at Sadler's Wells of *Othello*, with Mr. Charles Warner in the principal part, naturally excited considerable interest. Mr. Warner had been known for some time as a successful and versatile actor before he made a great success as Coupeau in an adaptation of *L'Assommoir*—a part of which M. Sarcey said, with some truth, that any capable actor could make a great success with it. Between Coupeau and Othello there is a wide gulf, and it is to Mr. Warner's credit that in *Othello* he has avoided to a great extent the pitfalls which a long run of Coupeau might have put in his way. He is devoid of that gross brutality which has recently enough been displayed, and been attended with success, in this part; and he is not by any means devoid of true dignity in the earlier scenes of the play. To point to one instance out of many, his parting of the combatants in the quarrel scene was admirable; and it should also be noted that his address to the Senate had the composure and dignity of a man assured of the justice of his cause, and of his own position with regard to those whom he addresses. So also in the scene of Iago's villainous suggestions Mr. Warner preserved a proper sense of his wife's and his own dignity. In the passionate scenes which follow this there was, we think, a falling off from the promise of the earlier acts. The actor completely avoided the offensive "realism" which has sometimes been given to the play; but he failed to give his part the poetry and magnificence which are needed to save it from being at best painful. It may be well to mention that our impressions are derived from a first night's performance. Most actors of standing are, like M. Got, incapable of doing full justice to their conceptions during the first few nights of a new character. Mr. Warner's theory of Othello seemed to us to be in the main that which some time ago was upheld in these columns, and we may have more to say about his performance of the part on a future occasion. One mistake, that of stabbing Desdemona after the first attempt to smother her, he would do well to correct at once. Mr. Vezin's excellent acting of Iago we have before now described at some length. On the first night at Sadler's Wells he missed to some extent the great effect of "the not that shall enmesh them all," but at other points his playing seemed to have improved. Miss Isabel Bateman's graceful and touching Desdemona shows a marked advance in her art. The piece is well mounted and well supported, but the duration of the *entr'actes* should be curtailed.

RACING AT DONCASTER.

AFTER several weeks of beautiful weather, it was rather dispiriting to the race-goers at Doncaster to come in for a deluge of rain. Nothing could have been more gloomy than the opening day; it was dark, it was cold, it was windy, and it was wet. The course itself was very heavy in some parts, and the racing was considerably affected by its condition. After a very showery morning, a drenching rain continued throughout the afternoon with scarcely any intermission.

There were fair fields for most of the races on Tuesday. Nine starters came out for the Fitzwilliam Stakes, the opening race of the meeting. Tower and Sword, on the strength of his recent running, was made the favourite, and he won the race; but not until he had had a hard struggle with Chevronel, and it is not certain that he would have won if he had not had the advantage of Archer's jockeyship. He was brought up with a rush just at the proper moment, and he won by a head only. The next race was also well contested. The winner was the two-year-old Amy Melville, by Albert Victor, a filly of very moderate merit. The following race was of no special interest, and it was run in a tremendous storm of rain. The Selling Stakes, which succeeded it, is scarcely worth noticing. Then came the Great Yorkshire Handicap. The favourite for this was Reveller, the winner of the Goodwood Stakes. This horse had been purchased for 770 guineas as a yearling, but he had not run in public until he was well into his three-year-old career. He is a good-looking horse, with a great deal of bone and power, and he was just the kind of horse to run well on a day like the Tuesday of the late Doncaster week, when the course was heavy. Almost as good a favourite was Bonnie Marden. This mare had been second both for the Oaks and for the Coronation Stakes at Ascot; but, whatever her merits may have been, she was not well suited by nature for racing in wet weather, for she is deficient in the very points in which Reveller excels—namely, bone and power. Bay Archer, who, like Reveller, was a Goodwood Stakes winner, also started; but he was heavily weighted, and it is said that he has been suffering from a sore back. Another heavily penalized starter was Elizabeth, the winner of the One Thousand Guineas. This good filly had won five out of seven races this year; but 19 lbs. seemed a great deal for her to give to Bonnie Marden. The race was won easily enough by Reveller, though he was not ridden out more than a neck in front of the second horse. The other favourites ran very badly, and none of them made any apparent attempt at racing after the leading horses had got into the straight. A still more interesting race succeeded the Great Yorkshire Handicap. This was the Champagne Stakes, which is probably the most important race at Doncaster after the St. Leger. Of course Bal Gal was the favourite. This filly had never been beaten. She had won the July Stakes at Newmarket, the Richmond and the Rous Memorial Stakes at Goodwood, and the Prince of Wales's Stakes at York—stakes amounting in value to considerably over 5,000*l*. Seven other two-year-olds ran against her, but to no purpose, as she won in a canter by three lengths. There was a dead heat for second place between Angelina and Mazurka, but the former was eased as soon as her jockey perceived that all hopes of her victory were at an end, so that the dead heat was more of an accident than anything else. It is a great pity that so excellent and heavily engaged a filly as Bal Gal should be reported to be a roarer. Even the great Bend Or himself, who like Bal Gal won the Richmond Stakes at Goodwood and the Prince of Wales's Stakes at York, had not won as much as has Bal Gal, a year ago. It is worth noticing that the five two-year-olds who first passed the post for the Champagne Stakes this year were all fillies. The Glasgow Plate for two-year-olds was easily won by Lamprey, and the day ended by a walk over for the Filly Stakes.

If the weather was wet on the Tuesday, it was even wetter on the Wednesday. A wet Leger day is almost as bad as a wet Derby day, and the pleasure of many thousands of people was spoiled on the Wednesday of the late Doncaster week. To give some idea of the state of things, we may mention that when, after the St. Leger, Constable, who had been riding Cipolata, went to be weighed, his clothes were so saturated with rain and mud that he turned the scale at the 2 lbs. margin allowed by the rules of racing. Cipolata had run second, and as she had been backed for a place for a very large sum of money, there was considerable anxiety as to what the stewards might decide in the matter. After a short deliberation, the authorities determined that, as the overweight was undoubtedly owing to the wetting that the jockey had undergone during the race, he was not disqualified. It would have been doubly mortifying to Constable to have been disqualified through an accident of this kind, as he had not only ridden, but also trained, Cipolata. The colours of some of the jockeys were so bespattered with slush as to be scarcely distinguishable, and in some parts of the course the mud was fetlock deep. Considerable interest was taken in the first race. Roehampton and Exeter were to compete for it, and it was believed to be a fine point whether the first-named or the second was the better of the pair. Another thing that gave importance to the race was that Exeter had been the trial horse of Robert the Devil; so people were prepared to form some conclusions as to the chance of the last-named horse for the St. Leger if Exeter ran particularly well or particularly badly. There was a third runner in Pearlina, who went away at the start and cantered in front for more than a mile, Exeter following next, and Roehampton bringing up the rear. As they came to the Rifle Butts, Roehampton passed the two leaders and made the running, and almost immediately afterwards Exeter passed

Pearlina and closely pursued Roehampton. The pair were racing hard against each other a long way from home; but as they came into the straight, Roehampton seemed to be wearying, and Exeter had a little the best of it for the rest of the race, winning at last very cleverly by a neck. There was a wretched field for the Corporation Stakes, only The Rajah and Mountebank going to the post. The former was a very strong favourite, but he never seemed to have the least chance during the race, as Mountebank made all the running, and won in a canter by two lengths. An outsider won the next race also, beating a field of eleven horses, more than half of which were far more fancied than himself. In a match which followed, although the favourite won, it was only by a neck, which did not leave much to spare, considering that as much as 5 to 2 had been laid on him. From the racing during the early part of the afternoon it was evident that the heavy state of the course made public form very untrustworthy, and backers of favourites for the St. Leger naturally became nervous. The marvel was that, in the face of such circumstances, Bend Or should have been made such a firm favourite at the last moment. We described the St. Leger last week; but we may add that there seems little doubt that Bend Or was run against by another horse during the race. It is said that he was struck on one of his forelegs as well as on one of his hocks by the feet of one of his opponents, and that when he was led away from the course he was lame. How far this accident may have interfered with his chances of victory in the race we are not in a position to say; but the mishap was probably owing in a great measure to the state of the course, as it is more difficult to steer horses round turns through heavy ground than when all is plain sailing. Moreover, when there are little pools of water on a course, as there were last Saturday week, horses often jump over them, and in doing so they are very apt to cannon against each other. The two races which followed the St. Leger were devoid of general interest, and the day ended with a couple of walks over.

Thursday's racing at Doncaster is rarely of special interest. The Portland Plate brought out fifteen starters, of which Peter was a strong favourite. He has grown into a tall but good-looking horse. Over such a heavy course 9 st. 7 lbs. seemed a very heavy weight for him to carry; but his friends were not afraid of it. The second favourite, Brotherhood, carried 6 lbs. extra, in order to have the advantage of Fordham's jockeyship. This seemed an adventurous proceeding, considering the state of the course. The great jockey, Archer, was to ride Hackthorpe, but he had scarcely been in form of late, and he was heavily weighted at 9 st. There was a long delay at the post owing to the fractiousness of two of the competitors, and as the length of the course is only five furlongs, there is always a scramble at the start for this race. When the field at last got off, a three-year-old which had not yet won a race, named Discount, drew away in front of the other horses. Peter ran very well, but at the distance, when his jockey wished to bring him forward, he was crowded out, and he was obliged to run on one side and get round a ruck of horses, which proceeding necessarily made him lose a good deal of ground. Yet he made a grand effort under his heavy weight in the deep ground to catch Discount, but failing to do so, he was beaten by a neck. Although Peter was defeated, this performance ought to be remembered to his credit, as he fought very gamely under overwhelming difficulties. In the Rous Plate, Mazurka, who had run a dead heat with Angelina for second place in the Champagne Stakes, was beaten easily by a filly by Doncaster, belonging to Lord Rosebery; Mazurka, however, had 12 lbs. the worst of the weights. In the next race, a great favourite was overthrown by a 10 to 1 outsider, and in the Alexandra Plate which followed, an even greater outsider, against whom as much as 14 to 1 was laid, cantered in twelve lengths in advance of the nearest of a field of fourteen opponents, all of whom practically pulled up at the distance. The last race of the day was a very hollow affair, the favourite winning by half-a-dozen lengths.

Friday was the only fine day of the meeting. The racing began with the Tattersall Stakes, to which Messrs. Tattersall contribute 200*l*. Then came a good match between a couple of two-year-olds, which was hardly contested and won by a head only. For the Doncaster Stakes, Apollo and Teviotdale were the only starters. Apollo is very small, but he had beaten the winner of the St. Leger in the spring. Teviotdale was the winner of the Ascot Stakes. The pair were now to meet at even weights, and Apollo was slightly the favourite. Apollo made the running, but Teviotdale closed with him at the bend. They ran in together, but Apollo always had the best of it, and he won, without having to fight very hard, by a neck. Dresden China was naturally made a good favourite for the Doncaster Cup, and this grand mare won with great ease by a length. The Prince of Wales's Nursery Plate was won by Vallon, but it was not a very glorious victory, considering that more than one of her opponents was giving her over two stone in weight. Witchery, who was the outsider, won the Westmoreland Stakes by four lengths, in a common canter. The last race of the meeting produced a fine contest between the two-year-olds Earl Godwin and Griselda, the former winning by a head.

The sale rings are one of the great features of the Doncaster Meeting. Nothing could have been more cheerless for sellers than the result of Tuesday's sales, for, out of fifty-eight lots, only eleven were sold. On Wednesday matters improved greatly. A large number of horses were sold, and, although a great many yearlings went for prices varying from twenty-five to fifty guineas, several lots realized high figures. Eleven hundred, eighteen hundred, and two thousand guineas were sums which no breeder of yearlings could fairly complain of. The colt which was sold for two thousand guineas is an own brother to Reveller, the winner of the Great Yorkshire Handicap; but it was by no means the general opinion that the yearling was as good looking as the four-year-old. The next day, although nothing like two thousand was given for one yearling, several brought in high prices, three selling for a thousand or more, one reaching thirteen hundred. Still there were a great many low prices. Two went for ten guineas a-piece, two for fifteen, and several were sold for twenty-five or under. On Friday one yearling was run up to seventeen hundred, and Apology, who won the St. Leger in 1874, was sold for three thousand two hundred guineas. Taken as a whole, it may be said that indifferent yearlings sold extremely badly during the late Doncaster week, but that good-looking yearlings sold for better prices than have been obtained for the last year or two.

In conclusion we would draw the attention of those who occasionally amuse themselves by either watching or reading about races to the approaching Cesarewitch, for, although a handicap, it promises to be one of the most interesting races of the year.

REVIEWS.

NICHOLSON'S MANUAL OF PALÆONTOLOGY.*

IN its new and greatly expanded form Dr. Nicholson's *Manual of Palæontology*, originally published several years ago, may be pronounced the most complete and systematic treatise on the subject in the English language. It has not only been thoroughly revised and to a great extent re-written, but so much enlarged by the addition of new matter that it may claim to be considered to all intents and purposes a new book. The final section of the original work, devoted to Historical or Stratigraphical Palæontology, having been relegated to the author's *Ancient Life-History of the Earth*, room has been found for incorporating all the more important results of palæontological research contained in works or special memoirs brought out in the intermediate period whether on the Continent of Europe, in America, or at home. Following the tendency of recent science in this department of inquiry, Dr. Nicholson has devoted considerably more space to the invertebrate than to the vertebrate animals, with which Professor Owen's valuable treatise on Palæontology, published several years ago, was almost exclusively occupied. It is with the invertebrate forms, as he truly remarks, that palæontological students are more largely concerned. Starting with the general definition of his subject as the "zoology and botany of the past," he insists on the necessity of some knowledge of existing forms of life, in order that the mind may be carried back to those embodied in the fossil state, and be prepared to recognize the continuity of descent and organization between the two. The domain of the geologist has also, he urges, to be trenched upon, that some knowledge may be gained of the rocks in which are entombed the fossil forms that constitute the materials of the palæontologist. The first five chapters of the manual before us are devoted to a summary view of the sedimentary or fossil-bearing rocks, their chief divisions and geological succession, with remarks upon the imperfection of the palæontological record, whereby gaps are left in the continuous evolution of life, species being here and there lost to sight, or others coming into view to which we have not as yet the means of assigning a distinct ancestry. Besides the effects of subsidence in burying possibly whole kingdoms of animal or plant life beneath the waves, the action of metamorphism has to be pointed out, obliterating the traces of life through a re-arrangement of the rocky particles under heat. Another cause of the disappearance of fossils is the percolation through the strata of water holding in solution carbonic acid, the calcareous remains being thus dissolved away. And, lastly, cleavage, if at all intense in action, will do much to prevent the recognition of fossil organisms in strata which have undergone such strain.

Although the terms class, order, genus, species, and variety are employed by the palæontologist in precisely the same sense and with precisely the same limitations as by the zoologist, it is to be noted that a palæontological species has not always of necessity the same value that should of right invariably belong to a zoological species. This is because the determination of fossil species must needs be based for the most part upon the character of the hard parts of the animal, and these are too often but imperfectly preserved. A wider and looser method of classification has thus necessarily to be adopted by the palæontologist. In the case of very variable or protean species it has been the practice of men of science to define the species by its central type, and to group the variable forms under this type as varieties, and to this plan our author has adhered. Impossible as it has been found to classify the whole animal kingdom upon any linear plan of descent or evolution, there is no difficulty in establishing certain fundamental morphological types or plans on which animals have been constructed, some

* *A Manual of Palæontology for the use of Students; with a General Introduction on the Principles of Palæontology.* By Henry Alleyne Nicholson, M.D., D.Sc., Ph.D., &c. Second Edition, revised and greatly enlarged. 2 vols. Edinburgh and London: Blackwood & Sons. 1879.

obviously higher than others in the scale of organization. Vast as is the number of known animals, all, whether living or extinct, may be classed under some five or six primary divisions, or morphological types, technically spoken of as sub-kingdoms. Distinct as these lines of demarcation are among living forms, and widely as these collectively differ from fossil animals, there are found among fossils not a few types comprehensive or transitional in their character, combining in themselves many features or functions never found separate, and thus serving as transitional links between groups at present far removed from one another. Widely remote as reptiles and birds, for example, now appear, there are fossil birds of a distinctly reptilian character, and fossil reptiles closely approximating to birds, the gap being thus partially filled up which now yawns between these two great divisions of the animal kingdom.

Again, many fossil animals exhibit what are termed "generalised" characters. If, namely, we construct for ourselves a "general" or "ideal" *type* for any great group of animals—a *type* which shall possess all the *essential* characters of the group, without its non-essential ones—then we find that the fossil animals of the same group are generally nearer to this type than are its living representatives. Moreover, the older representatives of any given group are usually nearer to the ideal type of the group—or are more "generalised"—than are the later representatives of the same group. All zoologists, however, admit that the process of development in any *individual* animal is one in which there is a gradual progress from the general to the special, the embryo being nearer to the general type of the group to which it belongs than the adult is. In other words, the embryo animal is more *generalised* than the adult, and the process of development is one of *specialisation*. Admitting this, it follows that the fossil forms belonging to any given group, in so far as they are "generalised" in their characters, may fairly be said to be "embryonic" types; and as the oldest forms of any given group are usually the least specialised, so they are likewise the most "embryonic." It must be borne in mind, however, that if we speak of fossil animals as being "embryonic types," we can only do so on the distinct understanding that it is not thereby implied that they were in any way *degraded* forms, or that they were at all less perfectly constructed or less thoroughly adapted for their surroundings than their modern representatives.

Although the fact of degradation must be admitted to explain the comparatively low place now occupied by certain organisms—a principle in biology recently discussed in some detail in our columns—there is, notwithstanding, no generalization more settled in palæontology than that of a general succession of organic types, the appearance of the lower forms of life having in the main preceded that of the higher forms in point of time. In other words, there has been not a succession only, but also a progression, of organic types, from the earliest fossiliferous deposits to the present day. How far, indeed, it may be possible to give evidence of a common ancestry for the two great classes or kingdoms of invertebrate and vertebrate life, indicating the point at which the latter type of organization, as presumably the higher, may be conceived as branching off from the parent stock in which it held community with, and was indistinguishable from, the invertebrate type, is a question which we do not find discussed in our author's pages, nor is it perhaps ripe for a satisfactory solution. The point of time at which either of the great morphological types first made its appearance on the globe may be expected, Dr. Nicholson remarks, to be pushed further back into the remote past by future discoveries of science. No new accession of knowledge, however, is likely to affect the relative order assigned to these great groups as compared with one another, the higher or more complex types following in point of time the lower and less complex. The invertebrate forms may thus safely be assumed to have preceded the vertebrate, though all the primary types are found in existence before the close of the Silurian period. It would even be rash to deny the possibility of their having existed under the earlier Cambrian age. So early do the lower sub-kingdoms of the invertebrata appear, that their origin is lost in the mists of antiquity. The Cambrian deposits, again, are underlaid by the vast series of the Laurentian beds, representing a long lapse of time for the persistence of what we must needs call animal life in its simplest known form. The classes of vertebrates are certainly not found ranging back to periods so remote, though they make their appearance, too, on the whole, in the order indicated by their zoological rank, the lowest first and the highest last. The earliest remains of vertebrate animals at present known, those of fishes—the lowest class of the sub-kingdom—appear in the Upper Silurian rocks. Even should they be found some day in the Lower Silurian or even the Cambrian series, they will hardly be displaced from ranking earliest in their sub-kingdom. Now these remains are by no means of the lowly form which might have been expected; in fact, they belong to two of the higher orders of their class. But this seeming anomaly disappears when we consider with our author that the two lowest orders of fishes possess hardly any structures whereby we might expect them to be represented in a fossil state. They may therefore have been in existence long before the ganoids and placoids of the Upper Silurian rocks. The remaining great order, the teleostean fishes, were certainly later in making their appearance; but whether they are to be held, as is the general opinion, inferior to the ganoids in zoological position is open to doubt. On the whole, without assuming the universal and conclusive action of evolution as a hard and fast theory of the derivation and succession of living forms, it may be taken by the student as a working hypothesis, invaluable indeed and indispensable for the interpretation and classification of the facts of palæontology.

Before entering on the detailed and systematic survey of the wide realm of palæozoology, which forms the second and principal portion of his work, Dr. Nicholson gives a clear and exhaustive synoptical table of the leading divisions of the animal kingdom, with their chief characteristics, the order of life ranging from its first faint rudimentary phase in the lowly protozoa to its ultimate and crowning glory in man. This tabular view sets forth at a glance the organic distinctions which determine or define the five sub-kingdoms into which invertebrate animals divide themselves—the protozoa, cœlenterata, annuloida, annulosa, and mollusca. The first and least organized of these sub-kingdoms are defined as animals simple or forming colonies usually very minute; the body composed of the structureless, jelly-like, albuminous substance called sarcode; not divided into regular segments; having no nervous system, no regular circulatory system, usually no mouth, no definite body-cavity or digestive system, or at most but a short gullet. Of these minute creatures the gregarinidæ (Class A) are such as inhabit the interior of insects and other animals, not having the power of throwing out prolongations of their body-substance (pseudopodia) which marks the rhizopodia (Class B), divided into the five orders of monera, amœba, foraminifera, radiolaria, and spongida. Few, if any, of these have a mouth, which belongs to Class C, the infusoria. These animalcules are destitute of the power of emitting pseudopodia, but are furnished with vibratile cilia or contractile filaments. The body is usually composed of three distinct layers. This class is made up of the three orders, ciliata, exemplified in the bell animalcule (vorticella) or paramœcium, flagellata, and suctoria. In the second sub-kingdom the animal canal communicates freely with the general cavity of the body, which is composed essentially of two layers or membranes, an outer layer or ectoderm, and an inner layer or endoderm. There is no circulatory system or heart, and in most no nervous system. The skin is furnished with minute stinging organs or thread-cells. In all these are distinct reproductive organs. In the hydrozoa (Class A) the walls of the digestive sac are not separated from those of the general body-cavity, the two coinciding with one another, and the reproductive organs are external; whereas in Class B, the actinozoa, these organs are internal, and the stomach opens below into the body-cavity, which is divided into a number of compartments by a series of vertical partitions or mesenteries. In sub-kingdom iii., annuloida, the alimentary canal is completely shut off from the general cavity of the body, and there is a distinct nervous system. A true blood-circulatory system may or may not be present; but in all there is a peculiar arrangement of canals, known as the water-vascular system, usually communicating with the exterior. The annuloida are divided into two great classes, the echinodermata and the scolecida. The former class, most commonly known as the sea-lilies (crinoidea), asteroidea (star-fishes), and echinoidea (sea-urchins) have an integument composed of numerous calcareous plates joined together, or leathery, with grains, spines, or tubercles of calcareous matter developed in it. The water-vascular system (ambulacral) is mostly employed in locomotion, and the nervous system is radiate, corresponding to the generally radiate form of the body. The scolecida have the body usually flattened, cylindrical, or worm-like, and the integument soft, without lime. The water-vascular system does not assist in locomotion, nor does the nervous system, one or two mere ganglia, radiate. In the annulosa (sub-kingdom iv.) the body is composed of numerous definite segments or somites, arranged longitudinally. The nervous system extends in a double chain of ganglia along the lower surface of the body. The clearness of our author's method is well shown in the enumeration of characters upon which are based the fourteen orders making up the class of crustacea, the four orders of arachnida, the four of myriapoda, and the thirteen of insecta. The last sub-kingdom, the mollusca, is treated with the same precision of definition and classification, which are applied with no less ability to the vertebrate kingdom. Within a few pages, in fact, a basis is laid on which the student is taught to build up for himself under the teacher's eye the whole fabric of systematic biology. Filling up as he proceeds, in the body of his work, the outlines laid down at the outset, Dr. Nicholson shows by the aid of typical examples, illustrated by admirable woodcuts, over seven hundred in number, the natural characteristics on which his classification rests. Where it differs, as every independent scheme of nature invariably will, in minor points from those that have gone before it, he is prepared with copious facts and reasonings drawn from his own stores of natural research, and fortified by an array of authorities of the highest order. To follow him in any measure through the exhaustive details of his treatise is wholly beyond our scope. We can do little more than present an epitome of his method, and express our deep sense of the fulness and admirable arrangement of his matter. We feel some surprise, however, at his having included the subject of Palæobotany if he found himself unable to allow more than fifty pages to that important branch of science. His summary of its leading facts and of the advances which have been most recently made in our knowledge of the plant life of former ages is excellent as far as it goes; but, as he himself says, it can claim to be no more than an elementary sketch of the general distribution of plants in past time, with a tabular view and classification of the chief forms of vegetable life which characterize each of the great formations. The value of his book is greatly enhanced by a list of the best works making up the literature of the subject, a copious glossary, and a full and minute index.

SIR ALI BABA'S INDIAN TOUR.*

THE high authorities in India a year ago were fluttered by the disagreeable consciousness that there was "a chiel among them," not only "taking notes," but inviting polite society in England to enjoy in his company the amusement which those notes afforded him. The identity of "the chiel" remained buried in an obscurity almost without precedent in a land where everything is proclaimed on the house-tops, and where small gossip is wafted far and wide by a ubiquitous horde of local correspondents. Still, whoever he might be, there was no doubt as to his epigrammatic and picturesque style, his hilarity of disposition, and his complete want of reverence for the sublimities of officialism. A Viceroy to him is merely "the great ornamental," "a presence to be felt, something floating loosely about in wide pantaloons and flying skirts, diffusing as he passes the fragrance of smile and pleasantry and cigarette." An aide-de-camp is "an arrangement in scarlet and gold"; a commander-in-chief is the pistol which the Government of India keeps under its pillow, "a beautiful article of Indian social upholstery," making mild jokes, telling venerable stories, pouring drowsy cackle into the ears of the old ladies whom he takes in to dinner, and sleeping peacefully through the hours during which he is supposed to be inspecting a cantonment. The Secretary to Government is the clever man of his year, passing brilliant examinations, affecting English literature, and a neophyte of the last new religious development. He fills the souls of Lieutenant-Governors with awe; he is placed on innumerable commissions; he writes hundredweights of reports; and "proves himself to have the true paralytic ink-flux, precisely the kind of wordy hæmorrhage required of a high official in India;" a successful joke stamps him as a wit; his drawing-room table, strewn with the latest flotsam and jetsam of European thought, forbids the intrusion of vulgar local topics into the home of æsthetic culture; so he moves up from one glory to another. The other officials are sketched off with similar touches of careless caricature. The political officers are "a Greek Chorus in our popular burlesque, Empire,' with the Foreign Secretary as prompter. "The Government," we are told, "keeps them scattered over the native States in small jungle stations. It furnishes them with Maharajahs, Nawabs, Rajahs, and chuprassees, according to their rank, and it usually throws in a house, a gaol, a doctor, a volume of Aitchison's 'Treaties,' an escort of native cavalry, a Star of India, an assistant, the powers of a first-class magistrate, a flag-staff, six camels, three tents, and a salute of eleven or thirteen guns." A distinguished royal visitor, it is hinted, wished to take home a "Political" as a local curiosity; but the thing was impossible:—

> The Political Agent cannot be taken home. The purple bloom fades in the scornful climate of England; the paralytic swagger passes into sheer imbecility; the thirteen-gun tall talk reverberates in jeering echoes; the "chuprassees" are only so many black men, and the rajah is felt to be a joke. The Political Agent cannot live beyond Aden.

The "Collector," as the real pivot of the great official wheel, is drawn with the exactness due to his importance; the sketch, like most of its companions, is warm with local colour; his long, low, rambling bungalow, furnished with folding tables and armchairs, bespeaks his wandering life:—

> He seems just to have arrived out of the firmament of green fields and mango groves that encircles the little station where he lives; or he seems just about to pass into it again. The shooting howdahs are lying in the verandahs; the elephant of a neighbouring landholder is swinging his hind-foot to and fro under a tree, or switching up straw on to his back; a dozen camels are lying down in a circle making bubbling noises, and tents are pitched here and there to dry, like so many white wings on which the whole establishment is about to rise and fly away—fly away "into the district," which is the correct expression—from the vast expanse of level plain, melting into the wide horizon-circle around.

All this is very life-like and picturesque, and it is the presence of similarly life-like and picturesque touches throughout that makes Sir Ali Baba's Tour so much better reading than the Indian journals of many of his contemporaries. It is of course no more a real description of the Indian administration than M. Jules Verne's fanciful flights are of the actual world; but, like M. Jules Verne, Mr. Mackay mixes up the true and the false, the possible and impossible, in an amusing medley, and so neatly that it is difficult to distinguish one from the other. Much of his fun seems to us absolute nonsense, but it may have a hidden meaning to the initiated, and much is intelligible even to untutored ears; and it is pleasant to know that, even in the dreary solitudes of Indian officialdom, life is cheered by a wholesome levity and stirred by the mild electricity of a random joke. No man—not even that sombre order of the species known as the Indian official—can live on the dry bread of Blue-Books alone or the solid rounds of official diet, which so many Englishmen in the East devour, in "silent patience" from one year's end to another throughout a long career. It is well, therefore, that fun can "even here its cheerful vigils keep," and vary the dull, grey monotony of existence with an occasional flash. Mr. Mackay holds, we believe, an educational appointment somewhere in the interior of India, a post which would have perfectly justified him in feeling dull and expressing his feelings in a dull book. No one could have objected if he had chosen to write a treatise on "Rajpoot Schools," or "Women in Central India," or any other of the dreary topics of which British India furnishes so inexhaustible a supply. Happily his temperament has led him in another direction; he leaves it to others to swell the great torrent of information under which so many Indian topics are submerged; he forbears to be instructive; he sees that the pomps and ceremonies, the grave and anxious business, the monotonous, toilsome life of the Indian official have all another aspect than that with which statisticians deal, and in which alone officials are apt to believe. People sometimes forget, the possibility of being absurd; but the life of the Englishman in India opens the door to many absurdities, of which it is well that he should be reminded. Nor are Indian officials the only people who stand in need of a little wholesome satire. The travelling M.P., "the British Lion Rampant," thirsting for information, and busy with "erroneous, hazy, distorted first impressions," destined for the transient glories of a monthly magazine, is no doubt a fearful visitation. Mr. Caird with his notebook appears to have excited the author's liveliest dislike, and he and others of his tribe are twitted with the blunders incidental to amateur inquirers. Before such people, says Mr. Mackay with some bitterness,

> India steams up in poetical mists, illusive, fantastic, subjective, ideal, picturesque. . . . . One of the most serious duties attending a residence in India is the correcting of those misapprehensions which your travelling M.P. sacrifices his bath to hustle on paper.

Sometimes, and it is on these occasions that we like him most, Mr. Mackay throws off his bantering style and lapses into a serious and even melancholy mood. He turns, with the weariness that a thoughtful man may naturally feel, from all that is dull, foolish, and provoking in the world around him. Tiresome officials, the swagger of authority, travelling M.P.'s, inquiring tourists with books of foolish notes, the dust and glare and gad-flies of life's journey, are all forgotten in other and more interesting topics which lie about its course. The great aggregate of humanity in the midst of which the Indian official passes his existence is full of pathos and interest; the immemorial village, with its names, customs, and offices, telling of a dim and far-off world of past generations, is a poem in itself; the villagers' life has to the eye that can look otherwise than through an atmosphere of statistics, "a soft glory resting upon it":—

> I would say something of that sweetness which a close communion with earth and heaven must shed upon the silence of lonely labour in the fields. God is ever with the cultivator in all the manifold sights and sounds of this marvellous world of His. In that mysterious temple of the Dawn, in which we of noisy mess-rooms, heated courts, and dusty offices are infrequent worshippers, the peasant is a priest. There he offers up his hopes and fears for rain and sunshine; there he listens to the anthems of birds we rarely hear, and interprets auguries that for us have little meaning.
>
> The beast of prey skulking back to his lair, the stag quenching his thirst ere retiring to the depths of the forest, the wedge of wild fowl flying with trumpet notes to some distant lake, the vulture hastening in heavy flight to the carrion that night has provided, the crane flapping to the shallows, and the jackal shuffling along to his shelter in the nullah, have each and all their portent to the initiated eye. Day, with its fierce glories, brings the throbbing silence of intense life, and under flickering shade, amid the soft pulsations of Nature, the cultivator lives his day-dream. What there is of squalor, and drudgery, and carking care in his life melts into a brief oblivion, and he is a man in the presence of his God with the holy stillness of Nature brooding over him. With lengthening shadows comes labour and a re-awaking. The air is once more full of all sweet sounds, from the fine whistle of the kite, sailing with supreme dominion through the azure depths of air, to the stir and buzzing chatter of little birds and crickets among the leaves and grass. The egret has resumed his fishing in the tank where the rain is stored for the poppy and sugar-cane fields, the sandpipers bustle along the margin, or wheel in little silvery clouds over the bright waters, the gloomy cormorant sits alert on the stump of a dead date-tree, the little black divers hurry in and out of the weeds, and ever and anon shoot under the water in hot quest of some tiny fish; the whole machinery of life and death is in full play, and our villager shouts to his patient oxen and lives his life. Then gradual darkness, and food with homely joys, a little talk, a little tobacco, a few sad songs, and kindly sleep.

Such, to the "inner eye" of sympathetic and intelligent contemplation, is the round of daily existence to at least 150 million tillers of the soil who obey the British Raj in the East. It is a great advantage that there should be, among the silent, busy multitude of Indian officials, men with poetic feeling for the picturesque and pathetic aspects of their work, and with leisure and literary skill to describe those aspects with grace and fidelity. Mr. Mackay's sketches show that, when he chooses to be serious and forgets to be satirical, he can rise to a really high standard of excellent and thoughtful writing. He will, if he takes our advice, aim hereafter at some higher flight, and give English society something less ephemeral than the lively squibs with which he has hitherto enlivened the pages of *Vanity Fair.*

* *Twenty-one Days in India, being the Tour of Sir Ali Baba, K.C.B.* By G. Abergh-Mackay. London: Allen & Co.

ANDERSON'S GUIDE TO LINCOLNSHIRE.*

SIR CHARLES ANDERSON, the college companion and life-long friend of Bishop Wilberforce, has brought out a little Guide-book to his native county, stamped with the racy originality of his own character. Guide-books are, as a rule, colourless productions; as Charles Lamb has it, "things in books' clothing," made to perish in the using, not much above the level of "draught-boards bound and lettered on the back." Sir Charles Anderson's tiny volume is a very different piece of work. Few books bear more clearly the stamp of the

* *The Lincoln Pocket Guide, being a Short Account of the Churches and Antiquities of the County, and of the Cathedral of the Blessed Virgin Mary of Lincoln, commonly called the Minster.* By Sir C. H. J. Anderson, Bart. London: Edward Stanford.

writer's personality. In every page we see the old Tory country gentleman—not a mere milk-and-water "Conservative," but a Tory of the old school—and the old-fashioned Churchman, with strong opinions and strong prejudices, vigorous in his likings and dislikings, but all tempered by kindliness of heart and genial charity, and regulated by sound practical common sense. Though essentially a *laudator temporis acti*, Sir Charles is no unreasoning opponent of modern reforms. While, *à propos* of the unhappy mistake of the Ecclesiastical Commissioners in purchasing and spending large sums on a country house two or three miles away from Lincoln, as the episcopal residence, when the grand old palace and its sloping gardens offered a site fraught with historical memories under the shadow of the Minster, he descants on "the evil of rushing into changes without sufficient acquaintance with the subject and its details," and enjoys a passing fling at "Board Schools more remarkable for their costliness than their utility," and "at the educational fanatics and philanthropic gerund-grinders" to whose "manipulation" our old educational endowments are subjected, all real improvements on the system of our forefathers receive his decided commendation. The rural police, for instance, he regards as a safeguard against much evil-doing, and bids those who "are apt to ask what is the use of police parading the country when there is so little crime" to remember how rife serious malpractices—notably sheep-stealing—were sixty years since; "people forget how much crime is thereby prevented and property preserved." We have called Sir Charles Anderson an old-fashioned Churchman; but his churchmanship is of no narrow, unprogressive stamp, for the man who wrote *Ancient Models* about forty years ago is fully aware of the necessity of adapting our churches and their services to the spirit of the age, instead of meeting every proposed reform with a dogged *non possumus*. In a guide-book to the county containing John Wesley's birth-place, Epworth in the Isle of Axholme, of which his father was rector, our author cannot avoid touching on the schism of which Wesley was the unwilling author. We quote the whole passage as an example both of Sir Charles's style, and of the practical wisdom of his remarks:—

The state of the diocese of Lincoln was then such that there can be no wonder a zealous and pious mind was shocked. With a non-resident bishop, careless archdeacons, absentee rectors and vicars, and negligent curates, religion was well-nigh extinguished, and however one may regret the extent of sectarianism now, it must be admitted that in these parts Christianity would have died out had it not been for the energy of Wesley. But instead of his zeal being taken advantage of and utilized for the Church of which he was a member, it was left to expend itself in individual efforts, and so he became the head of a party, which, however numerous and respectable, has since his time been split into sections, holding different views and opinions, and may possibly, having fulfilled its mission, give way to the increasing vitality of the National Church, if only the Church herself does not suffer shipwreck by internal quarrels, or by the treachery of statesmen professing to be conscientious churchmen.

Not only the Church as a spiritual corporation, but her services also are the subject of Sir Charles's animadversions. These pages show that he takes a warm interest in church music. He descants with delight on the grand Sunday evening services at Leeds parish church, when Dr. Hook was "t'ould vicar," with their "magnificent music and hearty congregational singing," bearing witness to "the life, spirit, and reality of worship there carried on"; while the nave service in York Minster with the Psalms chanted at the West Riding choir festival "by 500 voices from side to side," is appealed to as a proof "that the English cathedral service yields to none in dignity and grandeur." We gather that the services in his own cathedral are not quite so much to his taste; and that he prefers a fuller body of sound to "the lights and shadows" which have made the psalm-chanting of the choir of Lincoln deservedly famous among the cathedral choirs of England. These risings and fallings of sound in correspondence to the sense may indeed be easily overdone, and, in our author's words, the *diminuendos* may "become puerile and ludicrous from the tenuity of the sound in contrast with the vastness of the space." We cannot, however, at all accept Sir Charles's *dictum* that, while admissible in the anthem, they are "out of place in the general service." The chanting of the Psalms is the very centre of our Anglican service, and no pains can be excessive which are devoted to rendering it as intelligent as possible, and making the musical form a vehicle for the varying feelings embodied in the words. The sound should be in strict harmony with the sense. When, as we have heard in a cathedral choir, two Psalms of such totally different characters as the 22nd and 23rd—the one a wail of desolation and almost hopeless suffering, the other breathing calm and happy confidence—are shouted out to the same chant without any variation of time or tone, no other conclusion is possible than that both organist and choristers are entirely dead to the meaning of the words, and simply look on them as a *corpus vile* on which to exercise their musical and vocal skill.

From Church music it is an easy step to Church architecture, the subject with which Sir Charles Anderson's name has been so long and so beneficially connected. The author of one of the earliest works of the revival, to which we have already referred—the now almost forgotten *Ancient Models*, which largely contributed to the creation of a sounder taste in ecclesiastical architecture by calling modern church-builders back to the principles which guided the builders of former generations when the art was a living one—Sir Charles's latest production bespeaks a delight as fresh as ever in this, his favourite pursuit. His remarks on the characteristics of our leading cathedrals and other chief churches, comparing them one with another and dealing impartially with their respective merits and defects, are very suggestive. They show a wide knowledge, sound judgment, and, generally speaking, excellent taste. We fully agree with him in placing Lincoln *facile princeps* of all English cathedrals in external outline, and regarding its central tower as decidedly superior to its only rivals, those of Canterbury and Gloucester; but we demur to his opinion that "St. Hugh's choir has been the bane of the building," and are as far as possible from sharing in his regret that when the central tower fell in 1240 the choir did not fall with it. The loss of this, the earliest-dated example in England of pure Gothic without any trace of Norman influence, would have been simply irreparable. No part of Sir Charles's little volume will better repay careful study than that devoted to the cathedral of his native county. It is by many degrees the best guide hitherto published to that glorious fabric. There is hardly any one who can have known it so long, or have made it the subject of such minute and loving examination. Very few can remember with him the unhappy demolition of the western spires at the beginning of the century, the destruction of which, as well as the equally ill-judged melting down of the delicious "Lady peal" of the central tower to make the new "Great Tom" bigger than the old one, together with the "barbarous scarifying system" to which the west front was subjected some twenty years since, is animadverted upon with well-deserved severity. He records with satisfaction that "under the present management such misfortunes are not likely to recur."

The necessary monotony of a list and description of houses and churches, which form the staple of a guide-book, is relieved by Sir Charles's racy anecdotes, often couched in the vernacular of the county. Our limits do not allow quotation, and we must refer our readers to his pages for the request of the foreman of the jury at Kirton to be allowed to "swap" an obstinate juryman for one of more pliable stuff; and the perplexity of the judge at a trial of right of way, when told by a witness "he cud mind hugging tatees oot o't billy-buoys ower't t'bank intot t'rawd" (*Anglice*, "could remember carrying potatoes out of the barges over the bank into the road"); and the old woman's more forcible than flattering comparison of a drowsy preacher to a "bum'el bee upon a thistletop." There also they may read how "old Squire Whichcot" used to maintain a right of road at Fillingham against Sir Cecil Wray by coming annually in his coach and four attended by a gang of labourers who pulled down a bit of the intrusive wall, after which the squire drove triumphantly through the breach and back again, leaving Sir Cecil to build up his wall. As it was this Sir Cecil Wray to whom we owe the lamentable destruction of the east Roman gate at Lincoln, and most of the gate-houses of the Close, this annual demolition might be regarded as a just Nemesis. Going further back into the county records, Sir Charles tells us of the scare of the family at Blankney in 1745 at the news that Prince Charles Edward was at Derby and was marching to Lincoln, and how, while some proposed to take refuge in a hovel on the Fen, only reached by "jumping from hassock to hassock of the quaking bog," the old butler advised making short work of the rebels by putting ratsbane in the ale. Earlier still, we are told how Manby House, a seat of the Andersons, was stormed by the Parliamentarians, and the children, to avoid their falling into the hands of the soldiers, were dressed up as beggar's brats, and carried about in panniers from place to place by their faithful nurse; and how "Cavendish Bog" keeps up the memory of the gallant "Colonel Cavendish," mourned by Waller in an elegy, not one of his best. Such historical reminiscences give life and human interest to the book, and make it difficult to lay it down. Folk-lore is not passed over. Among other popular beliefs the author records the "Irbydale Ghost," whose "wild and dissonant cries" were supposed to issue from "the troubled soul of a witch worried to death by dogs in that lonely dale," and the "groaning ash" at Brampton, which terrified into a swoon a man who climbed up into its branches. The Isle of Axholme seems to retain many old customs, such as "riding the stang," "throwing the hood," "vessel-cupping," and burning the "yule log" at Christmas.

Sir Charles's personal reminiscences are not among the least attractive portions of his little book. Born soon after the beginning of the present century, he can tell from experience of the miseries of the coach journey to London, when,

leaving Lincoln by the mail at 2 P.M., supping at Peterborough at 9, the traveller . . . grumbling through a weary night at the obstinate legs of the opposite neighbour, and sorely pinched in the small of the back, was only delivered, cold and cross, at the Spread Eagle, Gracechurch Street, about 5 the next morning, with the choice of going to bed, with feet like ice, in a fireless room, opening out on an open-air gallery (where a box was fixed for the barber to shave travellers), or of sulking in a fusty coffee-room till the waiters were astir and the world was aired.

We cannot wonder that Sir Charles himself, as we gather, was accustomed during his undergraduate days to make his journeys to Oxford on horseback, reposing on his way at the "Greyhound" at Folkingham, "in a canopied crimson damask bed, made originally for the lord of the manor when he received his rents." He does not say whether he was personally present at the great boxing-match between Cribb and Molyneux in 1811, at "No man's land," at the junction of the three counties of Lincoln, Leicester, and Rutland; when, "after a severe fight, Molyneux, the black man, was beat, and a reel was danced by Gully"—afterwards M.P. for Pontefract—"and Cribb, amid the applause of a crowd of fifteen thousand persons." What a strange world do such reminiscences carry us back to!

Any survey of the county of Lincoln would be incomplete without a section on the Lincolnshire dialect. This hardly receives so much illustration from Sir Charles as it merits, and as he is capable of affording. Nor are the examples given so copious as we should have liked. He refers to the "Hickleton Feast" and other pieces composed in the Lincolnshire vernacular, without telling us where they are to be found, and pronounces "The Northern Farmer" of Tennyson—himself a Lincolnshire man, born at Somersby—"a failure, with the single exception of 'yal' for 'ale.'" Perhaps the fact that the work has been so admirably done for North Lincolnshire by Mr. E. A. Peacock of Bottesford, in his "Glossary" published by the Early English Text Society, has hindered him from entering more fully upon this subject. Though, as he justly remarks, the character of the speech of North Lincolnshire is much more Scandinavian than English, the Danish occupation having left its ineffaceable mark, not only on the local nomenclature of the county, with its "bys" and "holms" and "havens" and "nesses" and "thorps," but also on the daily speech of its inhabitants, we are a little surprised that so good a philologist as Sir Charles should have omitted all mention of the fact that it was the speech of South-West Lincolnshire which had the honour of setting the standard of the modern English tongue. Sir Charles mentions that the neighbourhood of Stamford is accredited with "less provincialism among the lower classes than most parts of England"; but when he comes to speak of Bourne he entirely passes over Robert Manning, better known as "Robert of Brunne," who, in the words of Mr. Freeman, "first gave currency to the dialect," and, as Mr. Kingston Oliphant has remarked, "foreshadowed the road that English literature was from that time forward to tread." A third edition of Sir Charles Anderson's little work—the present, though not so stated in the title-page, is really a second—will give him the opportunity of supplying this omission.

The special attractiveness of this little book on literary and archæological grounds must not lead us to overlook its merits as a guide-book to the city and county of Lincoln. Even were these considerably less than they are, the fact that it is at present the only work which can be put into the hands of any one wishing to make acquaintance with this confessedly unpicturesque but singularly interesting portion of England, would secure it a welcome. Our readers, however, will have seen that its excellences are such as to claim for it a very high place among English handbooks. The author tells us that it is chiefly intended for "those who are interested in old churches and ancient remains." Those who want more "modern information" he sends to White's excellent "Gazetteer" and "Kelly's Directory." All classes of readers, however, will find its pages singularly interesting and instructive.

We should add that the book contains a sketch of the history of the Fens, with which the whole county is so generally and undeservedly identified—"some there may be still existing who believe that the inhabitants are web-footed"—including the ornithology of that remarkable district, and that it is furnished with a map, not of the county, but, which is much more serviceable, of the whole area to which Lincolnshire belongs, from Hull and Howden to Peterborough and Melton in one direction, and from Lynn to Newark in the other. There is also a small but clear ground-plan of the Cathedral, in which the positions of the Roman city wall and the Norman apse are laid down, together with some woodcuts illustrating the original design of the west front before the erection of the screen wall, and when the towers were still crowned with spires. The index is less full than could be wished—*e.g.* neither Alfred nor Sweyn occurs in it, though the marriage of the one and the death of the other at Gainsborough are duly recorded in the text.

DOÑA PERFECTA.*

It is not altogether unknown to English readers that Spain has produced more than one novelist of considerable power during the last and present generations. The name of Fernan Caballero has even attained to some degree of popularity among us, and a translation has been given of some of the short stories of Antonio de Trueba. Nor do these writers stand alone. They are fully equalled in popularity in their own country by Pedro de Alarcon or Juan Valera, the latter of whom has a claim on the respect of Englishmen as a student and translator of Shakspeare. And of late years a dangerous rival has arisen to these writers in Don Benito Perez Galdós, a novelist of extraordinary fertility. He first attracted attention by a series of short tales called *Episodios Nacionales*, intended to illustrate the life of the Spanish people from the beginning of the century down to the death of Ferdinand VII. Neither the idea of such a series nor the title is original. Both are borrowed from Erckmann-Chatrian; but the stories themselves have the merit of being very readable and very Spanish, and that in the best sense of the word. In borrowing the idea of his tales, and in some degree the character of his hero, for they have only one, from his French contemporaries, Perez Galdós has not followed the example of so many of his countrymen, who borrow the style of their neighbour also. His language is not the colourless and Gallicized Spanish of the last century, but, as far as that is now possible, the vigorous and picturesque Castilian of the great sixteenth and seventeenth-century novelists—of Mendoza and Cervantes and Mateo Aleman, who lived before the victory of the "estilo culto." These stories, too, are comparatively free from mere national vanity. Although he has the excuse of belonging to a people which was attacked with wanton outrage, Galdós shows less hatred of the stranger than the authors of the "Invasion of 1814." In his "Battle of the Arapiles," or, as we less accurately call it, Salamanca, he has had sufficient liberality to confess that the fight was fought and the victory won by the British army alone, and he has drawn a picture of that army and of its great chief which ought to satisfy our most touchy patriotism. M. C. de Mazade to the contrary notwithstanding, Galdós is just to Joseph and the invaders. No one of these stories is equal as a piece of writing, as a mere picture of a past state of things done for the love of the subject, to Pedro de Alarcon's *Sombrero de Tres Picos*, which is a pen-and-ink rival to Fortuny's brilliant little canvasses, or is worthy of comparison with the *Pepita Jimenez* of Juan Valera; but they are well constructed tales well told. Latterly Don Benito has been at work on his *Novelas Contemporáneas*—pictures of the Spanish life of to-day. These stories do not form a series, but they are connected by the fact that they are all written with a definite object. Not that they are novels with a purpose, in the sense which is wearisomely familiar to the British critic, for no such novels would be read by Spaniards, who insist above all things on action and a plot; but they are all intended to show in different ways how the struggle which is going on in every family in Spain not utterly sunk in apathy between the narrow old religious fanaticism and modern liberal ideas affects the daily life of men, and Galdós looks on this struggle chiefly as an artist, but also as a Liberal. It is this which distinguishes him, on the one hand, from writers like Alarcon and Valera, who are purely artists, and, on the other, from Caballero and Trueba, who are pious and sentimental worshippers of the good old times, and cruelly addicted to the "Castilian vice of twaddle" about whatever is uncatholic or modern.

Of these novels the best and the most popular is *Doña Perfecta*. The scene of the story is the city of Orbajosa, and the time the eve of the last Carlist war. Orbajosa will not be discovered in any map of Spain; but, as the author justly says, its original may be found anywhere north, south, east, or west of Madrid. The most likely region in which to find it will be in the riñon de Castilla, the kidney—or, as we prefer to say, the heart—of Old Castile. The tourist who has approached any provincial town of central Spain across such a treeless and waterless plain as that which Pepe Rey and his guide, the peasant Tio Licurgo, ride through in the second chapter of this story, will recognize the portrait of Orbajosa as drawn by Perez Galdós, which we, for reasons to be stated further on, give here in our own translation:—

> After half-an-hour's ride there rose before the eyes of both [of Pepe Rey and his guide] an old town built on a slope in the shape of a cone, and from the highest point of which stood out a few black towers and the ruined stonework of a dismantled castle. A jumble of shapeless walls, of earth huts, grey and dusty as the soil, formed the base with a few remains of battlemented bulwarks, and under their shade a thousand mean hovels raised their poverty-stricken fronts of sun-dried bricks (adobes) like bloodless and starved faces begging alms from the passer-by.

Into this uninviting place, and through the crowds of repulsive beggars who swarm round its gates, Don José Rey rides to visit his aunt, Doña Perfecta de Polentinos, and to give effect to the plans which she and her brother, his father, have laid for his marriage to his cousin Rosario. Doña Perfecta is a notable woman. She is the widow of a spendthrift noble, who died just in time to save his great estate from complete ruin. This estate she has retrieved with the help of Pepe's father, an able lawyer in Seville, and has administered with great ability for many years. In the course of her long residence in Orbajosa, of which, like her husband, she is a native, she has become the ruling spirit of the place. Her house is the meeting-place of the local notabilities, the alcaldo, the municipal judge, the collector of taxes, even the bishop himself; for she is not only Mistress of the Robes to the Virgin of the Cathedral (as much a local notability as any of them), but the chief purveyor of the wardrobe. All and each of these persons, including the Virgin, are under obligations to Doña Perfecta which give her a far greater power in the town than is enjoyed by any representative of the Government. In return, she shares the narrow provincial patriotism and piety to the fullest extent. She hates and fears everything which is modern, or which comes from Madrid. Now, unfortunately for her nephew, he is not a Spaniard of the kind admired by Orbajosa, but an engineer, which in itself is a dangerous novelty; he has been educated abroad to a great degree, and is grievously suspected of believing much more in mathematics than in the Missal. In fact, like nine-tenths of his educated countrymen, Rey is a freethinker; he only differs from them in being a little more outspoken. All this Doña Perfecta rather guesses than knows, for she has never seen her nephew; but it is enough that he has been abroad, and belongs to a profession which is peculiarly associated with modern ideas of progress. Therefore, though the gratitude she owes her brother for his good services prevents her from refusing his offer, she has invited Pepe with the secret hope that he will give her an excuse for breaking off the match.

Moreover, she has a friend at hand who is thoroughly resolved to bring about a rupture. This is Don Inocencio, the Penitenciario, or Canon, who decides on cases of conscience too serious for the ordinary priest. Don Inocencio has a grandnephew, by name Jacinto, whom he would fain see married to Rosario, and if Pepe Rey can be

* *Doña Perfecta: a Tale of Modern Spain.* By B. Perez Galdós. Translated by D. P. W. London: S. Tinsley & Co. 1880.

dismissed he has a certainty of succeeding in his object. No sooner, therefore, has Pepe settled down in the house of Doña Perfecta than the Canon goes to work to draw him out on the subject of his opinions. It is not long before this irritates the young man into talking the most shocking heresy, and even deriding the grotesque attire of the venerated Virgin of the Cathedral, which is the handiwork of his aunt herself. This offence against her vanity naturally redoubles her pious zeal. She has already caused Rey infinite annoyance by secretly fomenting a captious lawsuit brought against him, and also by letting loose on him the offended patriotism of Orbajosa, indignant at learning that this insolent stranger finds it in a very backward condition. Now she openly declares that she will not accept him for a son-in-law, excuses her conduct towards him by the goodness of her intention, which is to preserve her daughter's soul, and generously offers to forgive him, if he will only go away and give up all pretensions to Rosario. But this Pepe Rey is thoroughly determined not to do. He and his cousin have fallen in love in good earnest, and have plighted troth in the chapel of the house without the knowledge of the mother. The scene in which they do this is the worst of the book. It is written in that declamatory style, verging at times on fustian, which Spaniards can seldom avoid when they wish to be tragical, and is out of keeping with the easy narrative and quiet irony of the other parts of the novel.

Just as Pepe and his aunt come to an open rupture, a brigade of troops arrives in the town, for the whole province is known by the Government to be on the verge of revolt. According to their custom in hot weather, they have marched on the town by night, and the sound of their screaming trumpets has broken in on the last stolen meeting of the lovers. Their arrival is very welcome to Rey, who has many friends in their ranks, and is already beginning to fear violence. Fortune aids him beyond his hopes, for one of his best friends, Lieutenant-Colonel Pinzon, is in the brigade, and is quartered in the house of Doña Perfecta. That lady is far from sharing his feelings. She and her friend the Canon are, in fact, actively engaged in preparing the coming outbreak, though carefully avoiding committing themselves in any way. Wishing to insult her nephew while it is still in her power, for he has not yet had time to leave the house, she sends Pinzon to his room, being unaware that they are acquainted. The result of this is that Pepe leaves behind him a skilful and daring correspondent. The fact of their friendship is kept concealed. Pinzon soon wins the good graces of Doña Perfecta, and not only contrives to pass letters to Rosario, but helps the lovers to meet. A plan is soon laid for an elopement, and is on the point of succeeding, when the interference of a hitherto subordinate personage brings about a catastrophe. This is Maria Remedios, the Canon's niece, and mother of Jacinto. This woman has but one object in life, and that is to secure a fortune for her son. Finding that her uncle has grown somewhat cold in the cause—for the first meetings of the lovers have been confessed, and he believes that they have been of a kind to make the marriage inevitable—Maria Remedios takes things into her own hands. By careful spying she has discovered that Pepe goes to the garden of his aunt's house at a certain hour of the night. Under the pretence of needing an escort, she persuades her reluctant uncle to ask one Cristobal Ramos, otherwise Caballuco, the hero of Orbajosa, to accompany her on an errand which she does not explain. The Canon suspects in his heart that she means mischief, but nothing explicit is said, and at his request Caballuco accompanies Maria. They follow Rey to the garden wall, and see him enter. Caballuco enters after him, while his companion alarms the house, just as Doña Perfecta, having accidentally found her daughter dressed at past midnight, has extorted from her a confession of her intended flight. She calls out to Caballuco to kill, and he obeys her. Rey defends himself, but the goodness of his cause does not compensate him for his opponent's skill, and he is shot on the spot. His death is fatal to Rosario's reason, and, while poetical justice is dealt to some of the offenders, the novel ends with a gloom befitting the time in which it is laid.

It will be seen that the story is of a sufficiently melodramatic character; but it is not on that account less true to the realities of Spanish life in troubled times. The characters are drawn with equal vigour and fidelity to nature. Doña Perfecta and Don Inocencio are types of a class of people very common in the Peninsula, and their portraits as given by Señor Galdós have excited great indignation among readers and writers of Trueba's school. They are guilty of duplicity and violence, not in spite but because of their religion and their blind local patriotism. The same may be said of Caballuco, with his mixture of real courage and equally real brutality; his belief that Orbajosa is the centre of the universe, and the perverted chivalry which makes him believe that he, Caballuco, as the son and grandson of *guerrilleros*, is bound in honour and conscience to form a "faccion" and take to the hills whenever there is trouble abroad. Don Cayetano Polentinos, with his great work on the family histories of Orbajosa, is a specimen of the scholars who, amid general neglect, still keep the torch of learning burning in a fitful way in the Peninsula. The other minor characters, such as Tio Licurgo the peasant, are drawn in a way which will do more to enlighten a foreign reader as to Spanish life and character than all the books of travel which have been written since the days of Aarsens de Tommelsdyck.

The translation of "D. P. W." is, however, very little adapted to enable the English reader to appreciate the merits of the original. Such sentences as this, "But here the solidity of material was wanting to person," would seem to show that he is somewhat deficient in a knowledge of the language into which he is translating. His knowledge of Spanish may be judged from the fact that he has translated the common word *apiñado* by "pine-clad," jumping probably to the conclusion that it was formed from *pino*, a pine; whereas, if he had opened Neumann and Baretti, he would have found that it is formed from *piña*, a cone, and means conical. Similar examples of mistranslation may be found in well nigh every page. For the rest, he would seem to have gone on the two following principles—first, that when you come to two adjectives differing by delicate shades of meaning, or to a proverb or idiom difficult to render, it is well to leave them out; secondly, that, as Spanish is a Romance tongue, the proper way to render it into English is to select longest and the most pompous words from the Latin which can be picked out of the dictionary. The reader who will picture to himself *La petite Fadette* subjected to this process will have formed an accurate idea of how D. P. W. has handled *Doña Perfecta*.

EDKINS ON CHINESE BUDDHISM.*

DR. EDKINS puts forth a powerful justification for the appearance of a work on Chinese Buddhism when he shows that the followers of Buddha far outnumber those of any other sect in the world; that of the entire number China contributes a large proportion; and, further, that Buddhist thought has largely infected the national literature. The extraordinary success of Buddhism in China forms a curious chapter in the history of religions; but it is readily susceptible of explanation if the condition of the public mind at the time of its introduction be remembered. At that period the doctrines of Confucius were supreme. Men were taught to concern themselves only with the performance of their social and political duties, and to eschew all considerations of a future state as being unprofitable, because incapable of proof, and as being productive only of superstitious follies. To the philosophical few these limits to thought were sufficiently wide; but the superstitious many failed to find the relief they wanted in such a purely secular system. The evils of life and the certainty of death were ever present calamities for which to the uneducated the teachings of Confucius brought no alleviation. Already men had eagerly caught up the debased system of Taoism, which was then in vogue, and their busy search after the philosopher's stone and the elixir of life showed how keenly they desired to find palliatives for the miseries of poverty and death. To all such Buddhism appealed, and not in vain. It did not profess to conquer death; but it invested the grave with a halo of spiritual glory as the entrance to eternal peace and rest. It held out no direct promises of wealth, but it taught that every act of worship, every charitable deed done, and every invocation of a Buddha, carried with them sure and certain rewards in this life. To the unhappy, the weakly, and the poverty-stricken, the monasteries also offered asylum and relief. Thus Buddhism supplied an existing want; and, in obedience to the inevitable law of supply and demand, it gained a great and rapid success.

We are told that in consequence of a dream the Emperor Ming-ti sent messengers to India to seek for Buddhist books and teachers. After an absence of six years the envoys returned, accompanied by several priests from Central India, who brought with them a number of Sutras, which were subsequently translated into Chinese. From this beginning the religion spread rapidly throughout the Empire, until towards the end of the fourth century "nine-tenths of the common people followed the faith of the great Indian sage." Meanwhile a constant supply of priests were imported into the country, who established monasteries and devoted themselves with extraordinary industry to the translation of their sacred books. One of the most celebrated of these immigrants was Kumarajiva, who was appointed by the reigning Emperor (A.D. 405) to revise the translations already made. With the diligence of his class he set to work, and, with the help of the native priests who were nominated to assist him, he completed more than three hundred volumes. But no less remarkable than the quantity was the quality of these translations. Through all subsequent ages they have formed a favourite study of Confucian scholars, who have taken as much pleasure in the purity of their literary style as in the philosophical ideas which they contain.

Shortly before the arrival of Kumarajiva, the celebrated Chinese priest Fa-hien, inspired by religious zeal, determined to make a pilgrimage to the holy land of his faith; and the record of his travels, which he subsequently published under the title of *Fuh kwo ki*, or "Account of Buddhist Countries," is the oldest and most valuable Chinese book of early travels in India and Central Asia which we possess. Its contents have been rendered accessible to English readers through the medium of Mr. Beal's translation. In its pages Fa-hien "describes the flourishing condition of Buddhism in the Steppes of Tartary, among the Ouighurs and the tribes residing west of the Caspian Sea, in Afghanistan, where the language and customs of Central India then prevailed, and the other lands watered by the Indus and its tributary rivers, in Central India and in Ceylon. Going back by sea from Ceylon, he reached Chang-an in the year 414, after fifteen years' absence."

It must not be supposed from what has been said that Buddhism

* *Chinese Buddhism: a Volume of Sketches, Historical, Descriptive, and Critical.* By Rev. Joseph Edkins, D.D. London: Trübner & Co. 1880.

was allowed to gain its sway over the people without vigorous protests from the Confucianists and Taoists. Again and again these enemies of the "foreign religion," as they called Buddhism, denounced it and its followers as dangerous to the stability of the State and to the morals of the people, and not unfrequently they succeeded in raising persecutions both against the native converts and their Indian instructors. But the hold which the teachings of Buddha acquired in the minds of the people rendered them proof against all attacks, and at the present day it is not an uncommon thing to find even professing Confucianists who would scout the idea of being considered Buddhists conforming to Buddhist rites. This last fact illustrates a curious power of the collective Chinese mind. Foreign systems, whether of religion or science, are readily accepted by the Chinese so long as they do not run counter to their preconceived notions, and in any system which may be presented to them they assimilate with ease those portions of it which are not antagonistic to their own views, and discard with indifference all that is heretical. Thus we find that at a comparatively early date Buddhism in China lost many of its distinctive features, and approached in many things to the teachings of Confucius. The doctrine enunciated by Bodhidharma, the great Indian patriarch of Chinese Buddhism, that "human nature in itself is sufficient for its own wants: all that is needed is to avoid both vice and virtue; he that can do this is a religious man," is more Confucian than Buddhist. On the other hand, as Dr. Edkins remarks:—

> When the rich (*i.e.* Confucianists) die in Peking, priests are invited to read liturgies for three days in their houses. Eight men are sent. . . . They read for about six hours each day, with a particular intonation, which is determined by a certain musical notation. . . . . They take with them candlesticks, a picture of Buddha, and the wooden fish. . . . Their object is by prayers to liberate as early as possible the soul of the dead from misery.

A practical illustration of this communism of rites is furnished by the temples of the three religions—Confucianism, Buddhism, and Taoism—in any one of which there may frequently be found deities of all three cults seated side by side.

The constant references in Buddhist records to the importation of Sanskrit manuscripts into China suggests the question which has lately been discussed, whether any are to be found at the present day. We know that, during the Sung dynasty (A.D. 965), one priest brought with him into China forty volumes of Sanskrit manuscripts written on palm leaves. It is certain, also, that the originals of all the works translated into Chinese must have been brought into the country, and yet Dr. Edkins has only been able to discover one manuscript, and that at Tien-t'ai in Southern China. Books have many enemies in China. Fire, war, insects, and the carelessness of man are accountable for a vast amount of destruction; but it is impossible to suppose that even these should have destroyed all but one manuscript. And the probability is that just as Japan, which was supposed to have been equally denuded of originals, has lately produced several manuscripts and inscriptions in the Sanskrit character, so we may expect to find in Chinese temples and monasteries records of the same nature. Even among the Chinese themselves there has at times existed a desire to preserve a knowledge of Sanskrit, and we are told that Jin-tsung, an emperor of the Sung dynasty, appointed fifty youths to study the language. Dr. Edkins speaks, and speaks with authority, of the value of the Buddhist transcriptions of Chinese words as guides to the pronunciation of Chinese at that date; but these transcriptions have an additional value in the support they give to the theory that Chinese was not always a monosyllabic language, and prove in some instances that the Indian priests adopted or invented characters to represent by their component parts words of more than one syllable. As an example, we may quote the character *Chuh*, which occurs in the appellation of the priest who is commonly called Chuh-fa-lan, and in the common name for India, *T'ien-chuh*. An analysis of this character shows that it is composed of the two parts *Shang* and *Chuh*, which were anciently read Shindu, the equivalent of Hindu; and the priest referred to should therefore be described as the Hindu Falan, and India as the Heavenly or Sacred Hindu. The constant recurrence of this character before the name of Indian priests—as, for instance, in the names Chuh Fuhsoh, Chuh Leuhyen, Chuh Tanwulan, Chuh Shuhlan, and others—and the fact that it is sometimes preceded by the character *Si*, the west or western, as well as by *T'ien*, heavenly, are evidences that it is in such cases to be read as a word by itself, and not as a syllable forming part of a word. Our knowledge of the phonetic writing of ancient Chinese is yet in its infancy, and the Chinese etymologists are powerless to help us; but strong evidence is to be produced that Chinese was not a monosyllabic language, and there is nothing but its present degenerate condition to prove the contrary.

It is impossible within our limits even to mention the various subjects connected with Buddhism with which Dr. Edkins deals. The title of the work inadequately represents the range of its contents. The first five chapters are devoted to a history of the life of Buddha, and an account of the Patriarchs of the Northern Buddhists; and among the final chapters we find one on the popular superstition known as *Fung shui*, which has scarcely more to do with Buddhism than with Christianity, and another on the *Wu wei kiaou*, or Do-nothing sect, which can only by compliment be called an offshoot from Buddhism. The fact is, this volume is for the most part made up of a collection of scattered writings, some of which were penned, as Dr. Edkins tells us in his preface, nearly twenty-five years ago. If we were inclined to carp, it is of this we should complain. There is scarcely anything new in the book. All students of Chinese Buddhism are grateful to Dr. Edkins for the zeal and ability he displayed in elucidating the mysteries of that phase of the religion when as yet very little was known about them. But he seems to have forgotten that of late years much new light has been thrown on the subject both from India and China. Dr. Eitel and Mr. Watters are the only modern authorities on the subject whom he appears, from his preface, to have consulted. In a chapter at the end of the work in which he gives a list of the "Books and papers that may be consulted for the study of Chinese Buddhism," he mentions the writings of Paladius and of Professor Beal among others, but he has learnt nothing from them. He has been content to reproduce, after revision, papers of a bygone date, and has chosen to ignore the results arrived at by later scholars. We do not say that modern research has materially impaired the value of Dr. Edkins's writings, but the public expects that a work on such a subject published in 1880 should be something more than a recital of papers which have been before the world for twenty years. Another objection which attaches to this style of compilation is the patchy effect produced. There is no consecutive train of thought leading on from one chapter to the next. The student is treated to a number of isolated essays on a subject requiring carefully worked out and logical treatment, and is left to make the most he can of them.

MANLEY'S NOTES ON GAME AND GAME SHOOTING.*

BOOKS on field sports have become so frequent of late years that we are inclined to regard with distrust any fresh contributions to the subject. It seems impossible that the writer should have much that is original to say, and it is improbable, as we have learned by melancholy experience, that he should be gifted with those very exceptional powers which have the art of rendering compilations agreeable. We do not assert that Mr. Manley has achieved the impossible, or that he has told us much that is positively new. But he has unquestionably succeeded in writing a pleasant little volume, with hints which novices may well lay to heart, and which will be neither unprofitable nor unpleasant to veterans. He need hardly have taken the pains to disclaim in his preface the intention of writing "an exhaustive treatise on the science and practice of shooting." As he goes on to observe, "the small size of the volume precludes such an ambitious idea." But he has given us, as he professes to give, a succession of somewhat discursive chapters, which nevertheless do satisfactory justice to the animals which he has singled out for their subjects. Mr. Manley is undoubtedly a good sportsman. That is to say, he delights in legitimate sport of all kinds, and objects strongly to new-fangled abuses. Like many of us, he would gladly, were it only possible, go back to the old-fashioned ways of our fathers. But the grubbing of hedgerows, and the straightening of fences, with the general progress in scientific cultivation, have wrought changes in many respects to which we must reconcile ourselves. For instance, it is comparatively seldom nowadays that we find the wild pheasant shooting which he describes with much spirit and unction; when you could turn a brace of steady old setters, or a couple of well-broken Clumber or Sussex spaniels, into the small copses and spinnies and the roots of the overgrown hedges, and with a gun on either side, and another sent ahead, congratulate yourself at the close of a well-spent day on the mixed bag in which pheasants predominated. Then men and dogs were continually on the alert, and each separate shot gave legitimate satisfaction. Should the shot chance to be an easy one, the luck was yours. Should the bird rise with a rush and rustle that somewhat fluttered you, and then take his flight through the branches of the hedgerow timber, astutely screening his body behind the trunks of the trees, when you did succeed in bringing him to grass, you saw him picked up with double pleasure. The dogs, who did their backing to the signalling of your hand, behaved with the chastened intelligence of Christians; and, moreover, that rough-and-ready shooting was a lottery, in which there was an exciting variety of prizes. The scramble of the dogs if they were hunting silent, or their cheery voices if they were in the habit of giving tongue, might mean hare or rabbit, pheasant or partridge, with the off-chance of an early outlying woodcock. And it was a kind of sport in which you might indulge yourself day after day. But now, with the system of over-preserving for battues, all that has been changed, and changed for the worse. The titled magnate or the broad-acred squire awaits his big shooting days under an anxious sense of responsibility. He has sacrificed much and spent his money in the hope of bringing off the "great event"; and while he is preparing everything for the eventful days, the enjoyment of his own covers is tabooed to him. When he takes a quiet stroll in the woods, he risks disturbing the pheasants; while, should he be accompanied in his walks by a favourite dog, it is positive sacrilege in the eyes of his head-keeper. And it is with some plausible show of right that the man becomes the master; for he is held responsible for the quantity of game that may be killed, and the "tips" that fluctuate with the results of the sport are tacitly recognized as the perquisites of his engagement.

* *Notes on Game and Game Shooting: Miscellaneous Observations on Birds and Animals, and the Sport which they afford for the Gun in Great Britain.* By J. J. Manley, M.A. London: The "Bazaar" Office. 1880.

We have translated into language of our own a grievance to which Mr. Manley repeatedly refers, because, in sympathy with the interests of the great body of sportsmen, we feel strongly on the subject. Had it not been for the abuses of excessive preserving, we should have been spared many misunderstandings between landlords and tenants; and probably we should have heard nothing, as yet at least, of the ill-considered measure which the Home Secretary has been "rushing" through Parliament. But Mr. Manley has written his volume, in the main, for quiet-going sportsmen of modest pretensions, who are content with such moderate shooting as ordinarily falls to one's lot. Each chapter is devoted, as we have said, to some distinct species of game—its habits, its merits on the table, and the best methods of circumventing it—beginning with the capercaillie and concluding with the snipe. And he writes with abundance of local knowledge, while, so far as our own experience goes, we have never detected him tripping in details. He appears to have made his first essays at shooting in Devonshire; but he is apparently as much at home on the Grampian Hills and the Perthshire moors as in the stubbles of Norfolk or the market-gardens of Essex. Of these last as haunts of game, by the way, he gives a very flattering report; he tells us that he has had as good partridge shooting as he could desire among vegetable beds within ten miles of St. Paul's; while hares in particular have an especial affection for the succulent cover afforded by parsnips. It is a "far cry" from Essex to Loch Awe, to parody an old proverb of the Campbells; and it is in the great pine forests appertaining to the Breadalbane branch of the clan that the capercaillie have been so successfully fostered of late years. We are told that already their range has extended so far as to lie roughly between Loch Lomond on the south and the North Esk river in Kincardineshire. We certainly were not aware that they had spread so far to the northward. But, noble birds as they are, and magnificently as they figure in a bag, there is a wide difference of opinion among Scotch lairds as to whether the country has gained by acclimatizing them. It is urged with great appearance of reason, that they do immense damage to the fir plantations by feeding on the buds and tender shoots. But Mr. Manley agrees with Mr. Harvie-Brown, who has written an interesting volume on the capercaillie, in which he defends them from the charges brought against them. In any case, and whatever may be the divergences of opinion, we may be sure that the capercaillie will increase and multiply as long as they are protected by proprietors who own great tracts of woodland. For, easy as is the mark they seem to offer, no game bird has a better notion of taking care of itself; and, like the pheasant or the woodcock, when they rise they instinctively try to interpose a screen of boughs between their bodies and the breechloaders. Mr. Manley is quite right when he asserts that comparatively few are killed in the course of the beats; and that the surest way of getting the better of their wariness is to send guns forward to station themselves in ambush. From the pine-forests affected by the capercaillie to the mountain summits where you find the ptarmigan and the "blue" hare, is comparatively but a step; and Mr. Manley gives a lively picture of a day's hare-driving. For the scene was on the hills above Loch Rannoch, where each summit commands a magnificent view of the sombre expanse of pines which we may call the capercaillie country. That is to say, the views would be magnificent were the weather propitious; but on the occasion of this particular *chasse*, as is too frequently the case, the party started in faith rather than hope. It was sanguinely asserted that the weather was "clearing up"; but so dense were the clouds and so dripping the atmosphere, that even the hardy Rannoch men engaged to do the driving, born "children of the mist" as they are, were found cowering under the shelter of a convenient knoll. As the arrangements had been made, the programme was carried out, though under circumstances that were disagreeable and even dangerous. Of course the chances of accident are indefinitely increased when the guns are to be stationed in the folds of a fog. The shooting, moreover, is seriously interfered with when, in place of a fair sight of the victims, you can but dimly discern phantom forms magnified or distorted by wreaths of mist that upset all calculations as to distance. This, however, ought hardly to be matter of complaint, inasmuch as it gives a better chance to the hares, which in ordinary circumstances present easy sitting shots that turn the battue into simple butchery. On this particular occasion Mr. Manley thus describes the situation:—

> Presently a gun is fired and then another, sounding for all the world like fog-signals. Then there is a decided opening in the rolling layers of fog, and I see a pair of ears—another—another. . . . I reload and fire, fire and reload, and when the mist closes in again I know that there must be a dozen prostrate enemies somewhere around me.

The upshot of the day's work for five guns was 414 hares, a highly satisfactory total in the unfavourable circumstances, though by no means out of the way. For these hill-hares, when left undisturbed except by the eagles and foxes which are their natural enemies, breed and multiply like rabbits, until the upper stretches of the grouse moors become absolutely tainted by them, as many a grouse-shooter has learned to his cost.

Speaking of the fecundity of hares, Mr. Manley places that of the low-country species in what will be a new light to many people. It is true that the hare has generally but two young ones at a birth, and seldom, if ever, more than three. But then she may have five or six litters in the course of the season, and occasionally "two sets of baby hares may be maturing for birth at the same time in one doe." Considering the probable results of recent legislation on the subject of ground game, it may be some slight consolation to know that hares like rabbits are marvellously prolific. We cannot attempt to do more than refer to the numerous useful practical hints that Mr. Manley offers to his youthful sportsman. But in relation to hares, which are "muffed" far too often, it will be well to remark the good old rule which he records, and which has by no means gone out of date, improvements in firearms notwithstanding. Aim "at the tips of the ears of a hare, or where they would be if they were pricked, when the hare is running in nearly a straight line away from the gun, and if it is crossing, aim well in advance." With which useful word of counsel we bring to a conclusion our remarks on a book in which, parodying the Scotchman's criticism on the sheep's head, we may say there is a great deal of fine confused reading to be found. We may add, by the way, *à propos* of the Scotch delicacy, that some of the gastronomical observations and suggestions are far from being undeserving the attention of the epicure.

MARSDEN ON COLLISIONS AT SEA.*

BY way of impressing his readers with the importance of his subject, Mr. Marsden states in the preface to this book that in the year 1878 about 15 per cent. of the steamships and 3·6 of the sailing vessels of the world suffered loss from collision, while in the Admiralty Division of the High Court of Justice in this country alone, within the twelvemonth ending October 31, 1878, actions were instituted in which sums amounting to very nearly a million sterling were claimed as damages for collisions. The same year witnessed many collisions disastrous to life, including that between the *Bywell Castle* and the *Princess Alice*, and that between the *Grosser Kurfürst* and the *König Wilhelm*. Add to the above data that a new Code of International Regulations for the Prevention of Collisions at Sea comes into force on September 1 next, and it will be seen that Mr. Marsden has not only chosen an important topic to write about, but has also been happy in his selection of the time at which to write about it. It only remains for us to see how he has accomplished his task.

Mr. Marsden opens by enumerating the four graver classes into which collisions at sea obviously fall—first, collisions where no blame is attributable to either party, the misfortune being occasioned by a storm or other *vis major*; secondly, where both parties are to blame for want of care or skill; thirdly, where the suffering party is alone in fault; fourthly, where the running-down vessel is the sole offender. So far as the liability for damages is concerned, it is only the second of these classes which calls for special notice, the absence or incidence of any liability in the other three being such as would naturally suggest itself. Where both ships are in fault, and both are injured, the law, Common as well as Admiralty, does not debar either from recovering, as in ordinary cases of contributory negligence, nor does it seek to apportion the loss according to the measure of fault attributable to each vessel. It metes out a sort of rough-and-ready remedy, not always strictly consonant with the justice of the case, by making each of the vessels pay half the loss of the other. Thus, as Mr. Marsden says at p. 2, "If the loss on A. is 1,000*l*., and that on B. is 2,000*l*., A. can recover 500*l*. against B., and B. can recover 1,000*l*. against A." The rule is, however, strictly limited to fault conducing to the collision, and does not include any negligence by which, though the collision was not brought about, its evil effects were enhanced. An apparent, though not an actual, exception is imported into the above rules by the salutary enactment of 1875, which provides that in all cases of collision each vessel shall stand by the other until it is ascertained that she has no need of further assistance, and that any vessel failing to do so shall, in the absence of proof to the contrary, be deemed to be solely in fault for the collision. Reflection will show that this regulation does not really interfere with the above-mentioned classification; but merely, in the interests of expediency and by means of a somewhat arbitrary legal fiction, assigns in certain circumstances collisions to a class to which they do not naturally belong. A similar consequence attaches to infringement of any of the regulations for the prevention of collisions, and is explicable on the same grounds. The rule as to equal division of loss would appear to be recognized only in the English and American courts; and an interesting account of its rise and history, and also of the views entertained by foreign courts, is to be found in a note appended to Chapter I. of Mr. Marsden's book.

Mr. Marsden wisely does not endeavour to give any general rules as to what constitutes negligence entitling the other party to recover, as distinguished from inevitable accident. As he truly says, "What degree of fault entitles the plaintiff to recover it is difficult or impossible to define. Apart from the particular circumstances of each case, the question does not admit of an answer." The nearest approach to a definition is that which he quotes from Dr. Lushington:—"We are not to expect extraordinary skill or extraordinary diligence, but that degree of skill and that degree of diligence which is generally to be found in persons who discharge their duty." In noticing at p. 20 the fact that, in the absence of special provisions in a bill of lading or otherwise, a shipowner is liable as an insurer for damage to goods

* *A Treatise on the Law of Collisions at Sea.* By Reginald G. Marsden, of the Inner Temple, Barrister-at-Law. London: Stevens & Sons. 1880.

consigned to him for carriage, without proof of negligence, Mr. Marsden falls into the common but not the less egregious error of classing passengers along with goods for this purpose. "Proof of negligence," he says, "is not always necessary to enable the owner of cargo, or a passenger, to recover against the carrier. The shipowner's liability as carrier, apart from the express stipulations of the contract of affreightment is that of insurer, except as against the Queen's enemies and the act of God." And, again:—"In the absence of a special contract restricting his liability it seems that the shipowner is liable for loss or injury to the owner of cargo or passengers on board his ship, in the case of collision, whether his ship is in fault or not." Now, though this is true so far as regards cargo, it is absolutely untrue with regard to passengers, and Mr. Marsden ought to know that it is so. Carriers, whether by land or sea, are in no wise insurers of their passengers, and are only responsible for injury sustained by them during transit on clear proof of negligence. A curious question with regard to the rights of passengers is raised by the doubt expressed in p. 47 as to "whether a person on board a ship which is herself in fault can recover at common law" against the owners of another ship likewise in fault for injuries received in a collision. The doubt of course arises from analogy to the doctrine which has in some cases attributed to passengers in a carriage negligence on the part of the driver which has contributed to an accident; but it is going rather far to identify any one of the hundreds of passengers on board an ocean steamer with the captain or crew, over whom he cannot have the slightest control. This is the view adopted by Mr. Marsden, and he further adds that in the Admiralty Division this point would unquestionably be decided in favour of the passenger.

"Inevitable accident" admits of more distinct definition than negligence, and Mr. Marsden gives several authoritative definitions, and adds a goodly list of instances illustrative of the principles which guide the courts in cases of accidents alleged to have been inevitable. In defining "acts of God," one type of inevitable accident, Mr. Marsden refers to the well-known case of Nugent *v.* Smith, i. C. P. D. 19; but we notice that he omits to mention that this decision was reversed on appeal (see p. 423 of the same volume of reports).

Where a liability accrues for negligent damage either to ship, cargo, life, or limb, such liability is, by a principle recognized only in marine law and embodied in comparatively recent statutes, limited, in the absence of actual fault or privity on the part of the owner or master, to a maximum of 15*l.* per ton of the registered tonnage of the offending vessel, where there is loss of life or personal injury, and 8*l.* per ton where the damage is confined to ship and cargo. In a valuable note, beginning at p. 73, Mr. Marsden deals with the history of this limitation, and contrasts the English law on this point with that of other countries.

One of the main difficulties of the law of collisions is that cases of collision frequently come before the English courts other than those where both vessels are English, or where the collision takes place within the acknowledged territorial waters of this country; and it is not at first sight very clear on what principle our courts exercise jurisdiction over such cases. In the first place, actions for collision are said to be *communis juris*, and the Admiralty Court has never refused to entertain an action because the owners of both ships are foreigners, or because the collision did not occur within British jurisdiction. A foreign shipowner, however, whose ship is in fault for a collision with a British vessel, is not probably over anxious to appear in an English court, and unless he can be personally served with process within the jurisdiction, or his ship found within three miles of our coasts and detained by virtue of what are known as "proceedings *in rem*," our courts have no power to make him amenable to their jurisdiction. If, however, a foreigner is once before them as defendant, by reason of either of these methods of compulsion, or voluntarily as a plaintiff, our courts, somewhat in contravention of the accepted doctrines as to jurisdiction and remedies, apply to his case many of our exclusively municipal enactments—such, for instance, as the limitation of liability, the presumption of fault for not standing by, before referred to, and so forth. It is only where the collision has occurred actually within the territorial waters of a foreign State that we take into consideration the counteracting effect of the laws of that State, should they differ from our own. The well-nigh universal adoption of the regulations before mentioned for preventing collisions has, however, done much to assimilate the maritime law of various nations, and to render innocuous this apparent assumption of jurisdiction. We have above referred to the detention of a foreign vessel when found within British jurisdiction, as a means of compelling her owner to answer for his misconduct in an English court. Exemption from such detention has always been accorded to foreign vessels of war; but recently questions have arisen as to how far vessels belonging to foreign sovereigns and possessing many of the attributes of ships of war, but at the time when it is sought to detain them actually engaged in trade, are entitled to claim such exemption. The cases of the *Charkieh* and the *Parlement Belge* are the standard authorities on this point, the latter having been so recently decided on appeal that Mr. Marsden is compelled to insert his notice of it in the addenda to his work. The whole question as to criminal liability for collision causing death or injury, both where the wrongdoer is a British subject, and where both he and his ship are foreign, was exhaustively discussed and elaborately decided in the well-known *Franconia* case, summarized by Mr. Marsden at p. 99. The judgment in that case having recognized the insufficiency of our municipal law to deal criminally with a foreigner in command of a foreign vessel who by the negligent navigation of that vessel caused the death of a British subject below low-water mark, but within three miles of the English coast, a statute was passed in 1877 to supply as far as might be that deficiency by conferring sufficient jurisdiction upon the English courts. It has, however, been, and is, a vexed question how far the British Legislature can create a right at variance with the claims of other States. Mr. Marsden only notices this statute in passing, and perhaps, as he is not writing upon international law, he is right in not entering upon the discussion, but we should like to have had his opinion on the point.

Chapter V. of Mr. Marsden's book deals with the question of compulsory pilotage, the equitable rule which exonerates the owners of a ship from liability for damage occasioned by their vessel while under the exclusive control of an authorized pilot to whom, by local regulations, they are compelled to entrust her for the time being; and the author gives a useful list of the districts within which such official pilotage is required.

With Chapter VI. begins Mr. Marsden's able commentary on the new International Sailing Regulations of 1880. Each regulation is set out verbatim, compared with the older ones still in force until next September, and illustrated by decided cases bearing on the directions contained in such regulation. We forbear criticizing this part of the work in detail, the regulations being of a purely technical character. Suffice it to say that the regulations appear admirably adapted to the attainment of their object—the lessening the risk of collision; and that Mr. Marsden's commentary will be most useful in assisting any person whose business it may be to determine which of two vessels in collision is to blame by reason of disregard of such regulations. The new rules follow pretty closely the lines of the old ones, the most noticeable of the new regulations being that which compels sailing vessels as well as steamers to moderate their speed in fog or snow, a new rule superseding the old port-helm direction for vessels meeting end-on, and a code of whistle-signals for steamships. In treating of the old rule as to the precautions to be observed by steamers in fog, Mr. Marsden refers to what we cannot but regard as a very hard case—namely, that of the *Lancashire*, a Liverpool and Birkenhead ferry-steamer, which was held in fault for a collision with another vessel occasioned by a dense fog, on the ground that she had no right to be under way at all in such weather. Considering the nature and importance of regular traffic between Birkenhead and Liverpool, this decision strikes us as going rather too far, and we are more inclined to agree with the American decisions, which hold that ferry-boats are not bound to stop running in fog, however dense, and that other vessels are required to know the usual track of ferry-boats and take precautions accordingly.

Mr. Marsden hardly deals at all with the subject of the inquiries directed by the Board of Trade with the view of suspending the certificates of captains or other officers who may be shown to have been in fault for collision or other accident at sea. As such inquiries, however, are not very frequent, and as the same rules respecting negligence, sailing regulations, and so forth, apply before the Wreck Commissioner as in the Admiralty Division or the Common Law Courts, the matter does not seem to call for special treatment. The omission of this and other subjects which might be supposed to be cognate to Mr. Marsden's selected topic has enabled him to keep his book within the limits of a convenient volume, and to distribute his remarks under few and clearly-defined heads, a great object where a book is intended for ready reference in cases of doubt either at sea or in the law courts.

LORD BRACKENBURY.*

THE faults in Miss Amelia Edwards's novel are neither few nor small, and yet it is a story that can be read with not a little interest. At all events it is one of those books that can be skimmed easily, and skimmed with pleasure. It abounds in descriptions, but these the reader can pass over or not, just as they may suit his time and taste. We are willing to allow that now and then she describes a scene or a place with a good deal of power. On the other hand, she is too often very prolix in this part of her writing, and somewhat dull. If we are not mistaken, *Lord Brackenbury* first appeared in the columns of an illustrated paper. We could almost imagine that the minute description that Miss Edwards gives of an old mansion, for instance, was written as a kind of comment on some picture that an artist had previously prepared. It is not easy on any other supposition to see why she should have gone into such an elaboration of details. It is an undoubted fact that authors at times illustrate artists, just as artists illustrate authors. We remember once meeting with an unhappy writer who had been supplied by a publisher with a hundred engravings—the plates of course were somewhat worn—for which he was to write just as many short tales. On the other hand, Miss Edwards may have a real pleasure in these highly-wrought and minute descriptions which seem at the present day to be in great favour with the public. Happily for the author, they are the easiest of all kinds of writing, and can be spun off as if they were so much cotton twist. Once easy writing was pronounced to be "desperately

* *Lord Brackenbury.* A Novel. By Amelia B. Edwards, Author of "Barbara's History," "Debenham's Vow," &c. 3 vols. London: Hurst & Blackett. 1880.

hard reading," but a happier time has come, and the novelist at all events is spared the trouble of thinking.

We will do Miss Edwards the justice to admit that in her descriptions she does not very often come up to the ordinary standard of silliness. Our novelists, as we have again and again had to point out, have for the most part long ago parted company with sense, and now bestow on their readers nothing but sound. She finds it, no doubt, needful to comply to a certain extent with the prevailing fashion, but happily she does not go beyond it. She writes picturesque nonsense from time to time, to prove that she is not altogether ignorant of the usages of society, but then she refreshes herself with fairly long stretches of sense. Every writer, she is well aware, if he wishes to establish a reputation, must prove that he can practise "word-painting." When once he has proved this to the satisfaction of the reader, he is not bound to be constantly exercising the art. Certainly, moderate though she is in the use of this particular kind of style, she shows that she could, if she chose, even rival the greatest masters of the art. Her descriptions of nature are especially fine, and her words are now and then uncommonly big. There is, moreover, in them a mixture of scientific terms which adds greatly to the effect. For instance, in the first book, when search is being made for a missing nobleman who was supposed to have been murdered, the heavens above are thus made to show their respect for the British peerage:—"A pageant of massy cumuli swept solemnly and swiftly overhead; and the depths of space between were powdered with keen stars." Later on in the same volume we come to another piece of writing which, like the one we have just quoted, reminds us equally of very minor poetry and of the weather-report in the newspapers. We read of "a dappled wedge of plumy cirro-stratus slanting athwart the sky like a vast wing, each purple feather tipped with crimson." Let Miss Edwards turn to her dictionary, and finding, as she will, that *cirrus* is a curl, explain what she means by a wedge of plumy curls that is like a vast wing. She rises perhaps to her greatest heights when her story leads her to the shores of the Mediterranean. She describes the green water of the Adriatic as scintillating at every stroke of the oar. What, we may ask, have the good old-fashioned words *spark* and *sparkle* done that they are getting turned out of the English language? There is not a novelist who will have anything to do with them. We hear of scintillating waters and scintillating stars. Passing on with the boat through the scintillations, we come, in the next page, to the opalescent domes of Venice, and "the mighty arch of the Rialto all iridiscent (*sic*) with reflected light." Now there is certainly one risk—and not a slight one either—in this use of big words. They are uncommonly hard to spell. It is possible to pass very comfortably through life, and even to write books, without so much as once using the word *iridescent*. If, however, we require it as one of the colours, as it were, in a piece of word-painting, it would be wiser only to employ it when we have a dictionary conveniently at hand. In like manner *heterogeneous* is a word that has much to be said in its praise. It is six syllables long, and it is derived from the Greek. Moreover, it is not supposed to convey any very exact meaning to the ordinary reader. But then, if it is to be used, let it not be shorn of its proportions, and written, as Miss Edwards in one place writes it, *heterogenous*. We would almost as soon see the Lord Mayor go in procession to Westminster in a coach and five instead of a coach and six. We have nothing to object, so far as the spelling goes, to such expressions as "his ultimate half-crown," for "his last half-crown," "a Maelström of millinery," "a dish of languid cutlets," and "a faint indefinite something that resolved itself into the measured beat of galloping hoofs." *Inaugurate* has so hopelessly come down in the world that it would not be fair to exclaim, when the author, in describing a Christmas party in Germany, says that the business of the evening was inaugurated with beer. However, we have some right to protest when she blunders in the displays of her learning. We have noticed that of late our lady novelists never miss a chance of showing both how much they know and how much their readers do not know. Their allusions—they never do more than allude—could scarcely be followed even by the proof-corrector of the latest edition of the *Encyclopædia Britannica*. The breathless reader is hurried through all time and all space, and is pelted with facts much as people are pelted in carnival time. In the shame that we feel at our ignorance and idleness when we compare the vast range of Miss Edwards's knowledge and the extent of her reading with our own, we are somewhat comforted to find that she is not infallible. She quotes Latin, or, at all events, she makes a venerable lawyer quote it. "Solviter (*sic*) ambulando, as we say in the classics." She would seem to have a familiar acquaintance with a whole library of authors, yet she writes of "Ben Johnson's (*sic*) verses," and "Johanna (*sic*) Baillie." We cannot but doubt whether she knows what kind of books it was that Joanna Baillie wrote. She says, "While other girls of her age were reading Miss Edgeworth and Johanna Baillie, Winifred Savage was deep in *Macbeth* and *King Lear*." Certainly it is very strange thus to couple her with Miss Edgeworth, and to make her commonly read by young girls some five-and-twenty years ago. In geography and in the knowledge of foreign lands, as well as in literature, Miss Edwards makes a brave show. Yet here, too, she shows that she was educated in an age when as yet girls were not prepared for University examinations. She is excusing herself for what she calls "a saltatory style of writing." She says that life is made up of intrusions. For instance, two ships have been known to meet in a foggy night precisely under the line of the equator—somewhat a rare occurrence, we should imagine. Then she passes on to rivers. "Two rivers," she says, "widely remote in their sources, converge as of set purpose, and meet to change the destinies of nations." It would seem, by the way, as if the nations and their destinies existed first, and that then the rivers met. But it is not even here that we raise a protest. At the sentence that follows we must, however, make a stand. "Other rivers, like the Tigris and Euphrates," she writes, "make for a common goal, run parallel for a while, and having sought each other in vain, diverge for ever." When we came to this passage, we dared not trust our memory. For more years than we like to own, we had never doubted that the Tigris and Euphrates met, and poured their waters together into the Persian Gulf. But Miss Edwards is a lady of almost universal learning, and we would not stake our memory against her authority. We got down our atlas. Supported by it we venture to assert that, at all events, two years ago these two rivers did not diverge for ever. There has, no doubt, since then been a great change in our Eastern policy; but, to the best of our belief, nobody is alarmed by any corresponding convulsion in nature.

We are leaving ourselves, however, too little space for a description of Miss Edwards's story. The plot is really contrived with much skill, and in the double hero and heroine, and the two-fold love-making, the reader is provided with a great deal of both exciting and "tender" reading. It might perhaps be objected that the disappearance of the first hero is so long that interest in him is almost lost. He is absent quite as long as Achilles, and by the slow reader runs almost an equal chance of being forgotten. When he does return to the stage it must be owned that he has lost none of his freshness by lapse of time, and that he is even more striking in his disguise of an Italian sailor than he had been when avowedly an English nobleman, the owner of a fine estate, and purchasing in one day thirty-one thousand pounds worth of diamonds. He at once falls in love with a poor girl in Verona, and falls in love with a rapidity and a vehemence which would have done credit to Romeo himself. By this time the author had made out of her other pair of lovers all that she possibly could, and had brought them to the very edge of matrimony and dulness. But with the long-lost lord and his Juliet the story starts off again as freshly as if love-making had never been known till their time. Then, too, there is an agreeable seasoning of villains—an Italian assassin, a wicked valet, who plays the part of a second "Sir Roger Tichborne," and a rascally attorney of the well-known stamp. These are in their turn relieved by a virtuous curate, a German pastor, and a highly respectable Italian wheelwright; while, lest humdrum virtue should become dull, the spice of a little society talk is thrown in. The good people all have their trials, but everything turns out for the best in the end. The only mistake is that the curtain falls on the long-lost nobleman in tears. As he was really a virtuous and a happy member of the aristocracy, it should surely have been drawn up once more, when we should have taken our last leave of him surrounded by his family all lost in admiration at his surprising magnanimity.

RUSKIN ON PROUT AND WILLIAM HUNT.*

MR. RUSKIN says incidentally in the course of these Notes that there are always twenty people who will do him a personal kindness for one who will take his advice about an important public object. This plaintive confession has given us more material for reflection than any other passage in these desultory, but very interesting and picturesque, Notes. It gives us, more distinctly than any of those more strenuous and passionate utterances to which we are by this time accustomed, a sense of the absolute hopelessness of our ever seeing Mr. Ruskin restored to his right mind about his own work, or even dimly conscious of his own true force and function. The twenty people are anxious to do him a kindness because in his earlier works he gave them so much genuine pleasure, instruction, and enlightenment; they are unwilling to take his advice about an important public object because they are tacitly or openly of opinion that one of the most delicate connoisseurs of art that have ever lived is also the most confused, short-sighted, and Utopian political economist that is, at all events, now alive and prominent. If Mr. Ruskin would only take the opinion, not of his enemies and critics, but of the twenty people who are anxious to do him a kindness, we should be saved a great deal of nonsense about iron girders, and Eastern policy, and the iniquity of public reservoirs, and should get in return winged words of eloquence about Luini and the sweet influences of the Lombard school. It was by writing of the latter order that Mr. Ruskin ascended the platform of which he now takes a false advantage to weary us with unscientific economy and blundering politics. However, we are now quite sure that he is incorrigible, and we must be content with hoping that he will do as little as possible to tear down the edifice of taste which he spent so many years in building up. He never was a really catholic critic. Even in his laudation of the great school of Venice there was an undercurrent of flightiness that should have prepared us for such later feats as his invectives against Michel Angelo, his abuse of

* *Notes by Mr. Ruskin on Samuel Prout and William Hunt; in Illustration of a Loan Collection of Drawings.* Illustrated with Twenty Autotypes. The Fine Art Society.

Walker's noble picture of "The Bathers," and his suspicion of all sculpture not directly Gothic. He never understood the dominance of the human figure in all really first-rate art, and still less, as Mr. Poyntor has shown, its supreme inherent beauty. But in his early books this and other peculiarities were kept well in the background, and were condoned by an extraordinary novelty and truth of statement in other directions. Of late the prejudices and oddities of his style have become predominant, and it is no longer safe to take his opinion in any of the more important regions of art.

There are still, however, byways and quiet backwaters of æsthetic criticism where Mr. Ruskin's judgment retains its old delicacy and propriety. The Notes before us deal with one of these little domains in which his authority is still unchallenged. It is long since Mr. Ruskin has written anything so enjoyable, so little marked by prejudice and eccentricity, as his short prefatory essay to this collection of the drawings of Samuel Prout and William Hunt. In water-colour studies of grapes and birds' nests, or in pencil drawings of Continental cathedrals, there is but little to awaken Mr. Ruskin's peculiar passion. "Cachez, cachez vos tabliers rouges," and you may still enjoy the society of the unrivalled student of nature without any danger of suddenly seeking the skies on the horns of an economical dilemma. Seriously speaking, it is now only on such harmless themes as are discussed in the volume before us that it is possible to get any reasonable language from Mr. Ruskin; and even here he does not keep clear of paradox. For instance, he remarks that the old painters were possessed by an eclectic and aristocratic scorn for all but the mere picturesqueness of the poor, and rarely displayed "any other expression than that of contempt for their employments, and reproach to their recreations." A few pages further on we find Mrs. Allingham and Miss Kate Greenaway rated precisely because of the undignified way in which they have given a sort of coquettish charm to the employments and recreations of the poor. We feel something of the repulsion of the Satyr in the fable, and scarcely can sit down to the feast of art with a critic who blows hot and cold with the same lips.

As we have hinted before, there are many charming and some notable things here said in Mr. Ruskin's best manner about Prout and Hunt. He preserves himself from the charge of exaggeration by skilfully hedging his praise in both instances. He does not even appear to say that Prout's studies of buildings and Hunt's little fragments of still life are types of what is highest in art, but he praises, with great tact and delicacy, what is best in them. We are of opinion that too much praise has been given to the singularly limited and unambitious talent of William Hunt. Mr. Ruskin himself admits that in galleries and great houses his drawings look, as he puts it, "not other than pert," and that the artist worked away at his specimens for years without caring to know the difference between a fern and a moss, or to study the habits or even the specific distinctions of the birds he drew. This, to our mind, was but the most patent sign of a radical intellectual dulness or indifference which went through his work, and destroyed the lasting charm of it. There should be a limit to the painting of grapes and plums, and Hunt had not even the vivacity to alternate the incessant study of these fruits by grouping with them a few strawberries or apples. He painted dead birds—principally dead doves—but never living birds; nests with eggs in them, but never nestlings. It seemed as though life, variety, freshness, all the things that are most charming to us, had only been revealed to him once and for a moment. He could always paint, over and over, what he saw in that supposed instant of inspiration, but he could not repeat it. The divine flash never came again, and his work was reduced to a kind of clockwork. Once Mr. Ruskin commissioned him to paint a dead chicken, as a little variety from the dead dove; but, although the old man most carefully and kindly did his best, the drawing was a mere disappointment to the amateur, and the painting of the chicken had to be ultimately given up. In his studies of country life, which have a certain charm in their brightness and rustic purity, he succeeded better, yet it requires the faith of Mr. Ruskin to admit that even these are "all of them virtually faultless." The "Shy Sitter," an autotype of which forms the preface to the present volume, does deserve this praise. Within the compass of a conception radically narrow, it is indeed faultless, and extremely pretty. Its daintiness and freshness, and the fine expression of an unreasoning terror, give it an extraordinary charm; but it is exceptional, even within the limits of Hunt's work, for delicate skill. These rural drawings, and the *genre* subjects—fruits, flowers, and dead animals—form the two pedestals upon which rests the fame of William Hunt, less securely perhaps than his greatest admirers are willing to acknowledge. The best of them will always be valued as specimens of exquisite workmanship, but we can imagine that a time will come when they will no longer attract much attention from any but amateurs. With this doubt on our own mind, we still bow to much that is said, and exquisitely said, in this paragraph about the difference between Hunt and such earlier flower-painters as Van Huysum:—

> In every flower-piece of pretension by the masters of that old school two accessory points of decoration are never absent. The first of these is the dew-drop or rain-drop—it may be two or three drops, of either size—on one of the smoothest petals of the central flower. This is always, and quite openly, done to show how well the painter can do it, not in the least with any enjoyment of wetness in the flower. The Dutchman never got a wet flower to paint from. He had his exquisite and exemplary poppy or tulip brought in from the market as he had occasion, and put on its dew-drops for it as a lady's dressing-maid puts on her diamonds, merely for state. But Hunt saw the flowers in his little garden really bright in the baptismal dawn, or drenched with the rain of noontide, and knew that no mortal could paint any real likeness of that heaven-shed light; and never once attempted it; you will find nothing in any of his pictures merely put on that you may try to wipe it off.

The other contrast is less ingenious; Mr. Ruskin rejoices in finding "no cunningly latent wasp or cautiously rampant caterpillar" in Hunt's pictures, and commends the virtue of the modern artist.

The interest taken in Prout by Mr. Ruskin is of course very subtly interwoven with the critic's personal attachment to the buildings Prout drew, and he values the drawings mainly as the best examples existing of the record of the old vanishing architecture of Europe to secure which has been one of the main and most meritorious objects of his teaching. He forms the most sympathetic of possible guides to the delicate pencil drawings of Prout, and contrives by his learned eloquence to irradiate the drawings themselves with his own enthusiasm, so that we are almost persuaded to believe that Prout, that simple-minded workman, had a fully articulated code of architectural morals. The autotypes which illustrate this section of the work are exceedingly delightful; the process seems to reproduce the light and varying touch of the lead pencil with particular accuracy. The drawing of Abbeville, for instance, preserves in autotype all the charm of the original work in such technical points as the beautiful way in which the lowest portion of the façade of the cathedral, just before it disappears behind the houses, has been touched with the stump so as to delicately lighten the lines, and put atmosphere between it and the roofs. The "Ghent," too, is exceedingly enjoyable, and rewards the most patient study in detail. We greatly prefer these drawings on the spot to the more elaborate water-colours which Prout afterwards prepared for exhibition in the gallery of the Society. These, although wonderfully accurate and careful, were scarcely works of art; the former are as full of feeling and inspiration as any sketches of their class that were ever made, conscientious, unobtrusive, and refined. Their faint reticulations upon the page give the same delight to the eye as is given by delicate traceries of beaten silver.

AMERICAN LITERATURE.

MR. MANN'S work (1) on the history and fortunes of Republics, ancient and mediæval, is a book of a much more elaborate character, of higher pretensions, and, we think, of much greater merit, than American scholarship commonly produces. It can hardly pretend to rank with such histories as those for which the world is indebted to Mr. Prescott, Mr. Motley, and one or two others of their countrymen whose nationality is almost forgotten in the universality of their reputation. Emanating from an English University, it might rank rather with second-rate than with first-rate books of the class to which it belongs. But in American historical literature the second class scarcely exists; between the classics of which we have spoken and the multitude of works that hardly aspire above the rank of college text-books there is a vast and almost empty interval, and Mr. Mann's work must be placed much nearer to the higher than the lower boundary of this unoccupied region. Its title hardly, perhaps, gives a fair or adequate idea of its contents. It is probably because the materials are so much more ample that the space occupied by the story of the Hellenic and Roman commonwealths is so much greater than that allotted to all other Republics of the Old World together. Yet the author fully realizes the importance of those other States of whose character and earlier fortunes we know so little, great as was the part they played in the world's history prior to the establishment of Hellenic or rather Macedonian supremacy in Asia, and of Roman autocracy throughout the then limits of civilization. The prehistoric greatness of Tyre, and the vast empire of Carthage—respectively the Venice and the Holland of antiquity—are among the most interesting and most disappointing problems that can engage the attention of an historian. The relation of the Israelitish commonwealth to the politics of the East is obscured in its native history by questions of deeper and higher moment, and is almost ignored by those who deal primarily with the records of the great empires to which Palestine was sometimes a petty though stubborn enemy, sometimes an unprofitable and rebellious province, but always a secondary care. The work before us has this especial value, that its method at least, if not always its treatment, brings to the reader's mind the fact, so easily forgotten by those who follow the road originally marked out by Greek and Latin historians and beaten by the footsteps of their successors down to the present day, that till the age of Alexander Athens and Sparta were but the dominant cantons of a race which, if the most skilful in war and in arts among its rivals, was yet one of the lesser Powers of its time; that the Greece of Pericles and Agesilaus was but one member of the family of nations, and by no means the foremost; and that, throughout the early history even of Rome, the Hellenic States of the East and of Sicily, the maritime States of Italy, had constantly before their eyes a rival which, though less aggressive than most of its neighbours, was nevertheless always a jealous neigh-

(1) *Ancient and Mediæval Republics: a Review of their Institutions, and of the Causes of their Decline and Fall.* By Henry Mann. Chicago and New York: Barnes & Co. London: Sampson Low & Co.

bour, often a formidable enemy, and now and then a possible conqueror. It is not Mr. Mann's purpose to enlarge on the external aspect of Greek and Italian politics; but his plan obliges him to bring together in the same work the story of all the several commonwealths which at one time divided, at another contended for maritime supremacy in the Mediterranean and military dominion on its shores. The materials for an account of their mutual relations, when not actually at war with one another, are unluckily almost as scanty as those from which the writers followed by Mr. Mann have striven to reconstruct the internal story of the vanquished States and races. Imagination rather than inquiry must represent to the modern reader the manner in which the shadow of Carthage loomed in the distance while Athens and Sparta contended for the first place in Levantine Greece, and the Hellenic and other independent States of Italy waged or prepared for the struggle with Rome that must have been foreseen generations before it was actually forced upon them; the Phœnician view of their exclusive and aggressive neighbours in Palestine; and the gradual introduction among the Asiatic and Ægean Greeks of more or less inaccurate notions of so peculiar a people, derived from Tyrian authorities, which gave Alexander and his successors a certain interest in the Jews before they actually came into collision. Mr. Mann only reminds us that there were other and at one time greater commonwealths than those of Greece and Rome, and familiarizes his readers with the little that modern investigation has gathered respecting their institutions, character, and history. Into the better-known story of Greek, and especially of Roman, law and politics he enters at much greater, and we are disposed to think at disproportionate, length. The connexion between ancient and mediæval history is his excuse for dwelling on the development and decay of the Empire with scarcely less fulness and detail than on that phase of Roman story which more properly belong to his subject; but his account of the city commonwealths of the middle ages is hardly so complete or so elaborate as the importance of their place in the history of the republican idea and of popular government might have led us to expect. In short, considering the avowed purpose of the work, we hear somewhat too much of Greece, far too much of Rome, especially of Imperial Rome, and too little of the earlier and later Republics of Europe, Northern Africa, and Western Asia.

The smaller volume (2) on the same or a similar theme, published by a Boston firm, without the author's name, is of less interest and less pretension, and contains little that is new or striking, but adheres more closely to the topics indicated by its title. Perhaps it gives a somewhat more distinct view of that which it is the professed aim of both works to explain—the weaknesses that led to the decay or overthrow of those States of old whose institutions most resembled the constitutional system of the perfection and perpetuity of which American opinion is so confidently assured.

If the account of the life and public career of Senator Chandler of Michigan (3), compiled by the editorial staff of the Detroit *Post* can be called an "outline," it is only by comparison with the elaborate detail and enormous length of American biographies in general. Outside the State of Michigan we can hardly conceive that the warmest admirers of the Republican orator and intriguer can desire a portrait more fully worked out than that which its authors modestly call a sketch. Michigan has produced few men of eminence during the short period of its political existence, and it is intelligible that by comparison with his neighbours Zachariah Chandler may pass for a great man, worthy of a biographical monument bigger and heavier than even this large and closely printed volume. But, estimated by his place among his political contemporaries at Washington—very few of them men of extraordinary mental stature—he appeared by no means either the moral hero or the intellectual giant that he seems to the imagination of his present panegyrists. Like a majority of Northern politicians, he was born of parents neither rich nor distinguished; his father being a yeoman who emigrated in the early part of the century from the barren and confined farms of New England to the rich and almost unlimited region of the North-Western prairies. Unlike the rest, he made himself rich before he had passed middle life by a diligent and skilful manipulation of the varied and extensive kind of business that a clever, pushing, popular man may create in a rapidly growing but imperfectly organized community situated as Michigan then was; and, having made his fortune, he devoted himself to politics. He was notorious chiefly as one of the most violent and bitter Republicans of the violent and bitter period preceding the Civil War. That war was likely to be the issue of the controversies then raging Mr. Chandler early said and predicted—partly because he was more clear-sighted, chiefly, we think, because he was less troubled by scruples of constitutional principle than most of his associates. He cared as much as any Democrat for the Union, as little as any Abolitionist for the compromises by which the Union had been established, and the observance of which alone could entitle the majority to demand that the minority should adhere to it. He was resolute to maintain the Union and to assert the supremacy of the North and North-West therein; two objects which, as he was shrewd enough to see, could be reconciled only by the sword. He was also one of the few Republicans in the Senate or House of Representatives who were ready to answer with the pistol for the abuse they lavished on their Southern colleagues. He went so far as to approve the execution of John Brown as a precedent that might be advantageously used against the Secessionists; an argument which of itself implied his indifference to constitutional principles and his vigorous grasp of practical issues. He was among those who did their utmost to make war inevitable, and to render it ferocious; and had his counsels been followed—as after the death of Lincoln seemed possible—the victory of the North would have been stained by acts that would have rendered reconciliation impossible. The approval with which his wildest and most senseless invectives are repeated by his biographers, fifteen years after the conclusion of peace, is of itself a significant and a lamentable indication of the temper that still animates the party dominant in the North and West.

Dr. Weisse's treatise on the Obelisk (4) recently transferred to New York is at least as eccentric as it is interesting. The author gravely maintains on the part of the Masonic Order a claim to antiquity higher than any pretended by its familiar legends. Not content with a derivation from Solomon and the builders of the first Temple at Jerusalem, he discovers in the Egyptian monuments the primary symbols of Freemasonry, and in their sculptures, funereal and religious, representations not of the national mythology or the judgment on the departed soul, but of the masonic rites of initiation. He gives an account of the Tower of Babel which seems to have been evolved entirely out of his own consciousness, and ascribes the building to the first possessors of the Masonic secrets, and the diffusion of the mysteries to the dispersion of the builders. These reasonings are carried into the minutest details; and they have at least this advantage, that, to refute them in equal detail, the critic must be familiar at once with the antiquarian learning of the Egyptologists and with the formularies of Freemasonry.

Outlying Europe (5) is hardly true to the promise suggested by its title. The writer has travelled over little but beaten ground, and has nothing to tell that has not been told before. In short, the book is one of those innumerable American narratives of travel which seem to have no interest save for the writers, and which appear to be rather the excuse for a prolonged holiday than the fruit of serious travel and real inquiry.

The compiler of *Modern Thinkers* (6) has a perfect right to insist as strongly as he pleases on the destructive and negative aspects of scientific inquiry and philosophical speculation during the last fifteen or twenty years; but, in so doing, he should have chosen a more accurate and more explanatory title. As it is, the effect of his work upon those imperfectly informed readers for whom it is evidently intended can hardly fail to be deceptive; since they are by implication, if not explicitly, taught to accept as the general and almost exclusive course of recent thought what is, at the most, only its dominant tendency; and that, it may be, merely for the moment.

Nuggets of Gold (7) in this volume of trite and useless advice to young men we have found none. When the author departs from the safe ground of moral nullities, it is to display a signal lack alike of soundness and of originality; his philosophy is far from philosophic, and his "science" suggests a profound indifference to the derivation of the word. Indeed the title-page would suffice to warn a reader of experience that the contents could hardly be valuable. Real merit never advertises itself with such utter absence of modesty, such sublime insensibility to ridicule.

Fast and Loose in Dixie (8) is not "unprejudiced"; but, prejudice and exaggeration allowed for, it is a very readable and interesting story of a very spirited adventure, and one that deserved the success by which it was rewarded. An escape from Charleston, a tramp over many hundred miles of hostile country, and through the lines of more than one Southern force, ending in a Federal camp in East Tennessee, necessarily afforded almost as great an abundance of startling peril as of moving hardship; and both seem to have been manfully faced or skilfully evaded. The narrative is not too long; and if the writer's temper is not pleasant, especially considering the extreme kindness the fugitives received from

(6) *Modern Thinkers, principally upon Social Science; What they Think, and Why.* By Van Buren Denslow, LL.D. With an Introduction by Robert G. Ingersoll. Chicago: Belford, Clarke, & Co.

(7) *Nuggets of Gold; or, the Laws of Success in Life, in Brief and Pungent Lectures to Young Men; to which is added the Science of Alcoholic Medication; also the Philosophy of Labour, Wages, Capital, Money, and Wealth.* By John Heermans. Corning, N.Y.: published by the Author.

(8) *Fast and Loose in Dixie: an Unprejudiced Narrative of Personal Experience as a Prisoner of War at Libby, Macon, Savannah, and Charleston; with an Account of a Desperate Leap from a Moving Train of Cars, a Weary Tramp of Forty-five Days through Swamps and Mountains; Places and People Visited, &c.* By J. Madison Drake, Captain 9th New Jersey Veteran Vols. and Brevet Brig.-Gen. N.Y.N. New York: The Authors' Publishing Company.

Southern men and women whose friends had been killed and whose property had been ravaged by their comrades, we must pardon something to the desire of popularity with Northern readers, and something to the bitterness of physical sufferings not yet forgotten. The most remarkable feature of the story is certainly that of which we have spoken, the extraordinary forbearance of people who daily heard of Sherman's ruthless and lawless atrocities towards fugitive Southern prisoners; but the courage, high spirit, humour, and cleverness of the fugitives themselves contribute to render the tale interesting and to secure the sympathy of the reader.

Mountain and Prairie (9) is the narrative of a journey from Vancouver's Island to Lake Winnipeg in Manitoba, undertaken to trace the probable course of the Pacific Railroad, to the construction of which the Federal Government of Canada is pledged. The author's observations on the resources of the British colony on the Pacific, and of the various regions through which he passed, deserve fuller exposition than can be given them in this place. It is evident that Vancouver's Island is a most important possession, capable, for example, of supplying British fleets, mercantile and Royal, with coal for centuries to come; and that, after so much British territory has been recklessly surrendered, there remains enough, beyond the furthest limits of Canadian colonization, to form the seat of a great Pacific dominion in a future generation.

Judge and Jury (10) is a clever and readable, as well as a useful, book. It is primarily a collection of practical hints respecting the operation of State and Federal laws on those points of civil right and personal liability which are of common concern, and regarding which some obscurity or uncertainty prevails; about which, at any rate, American citizens of average education may be imperfectly informed. Illustrated by a variety of curious or interesting anecdotes, these legal technicalities are far from being dry or tedious reading; and the book is perhaps as well calculated to enlighten an Englishman unacquainted with American or Swiss legislation respecting the peculiarities of a Federal Government, and the several boundaries of State and national jurisdiction, as many much more elaborate works. It may suggest common sense and caution to a few enthusiastic reformers, who may see how their pet crotchets work when some semi-civilized community in the Far West has undertaken, for the common benefit of mankind, to try an experiment on its own *corpus vile*. Above all, it exemplifies the extreme inconvenience of lax and uncertain laws of marriage and divorce, and of such conflicts of jurisdiction thereon as may take place between England and Scotland, as well as between New York and Indiana.

The most interesting characteristic of the Channing Centenary Celebration (11) was the unanimity with which the great Unitarian preacher was claimed as a sympathetic spirit by the leaders of numerous sects, and the individual pastors of various eccentric congregations, with which he would have had little in common, and which, while he lived, would have anathematized him.

Saratoga (12) is now merely a watering-place, almost without a rival in the United States. But it has also been, in other days, an Indian resort, the scene of a great and critical battle, the centre of important political movements; and reminiscences of such a place are naturally far more varied and present more striking contrasts than can always be found in the fortunes even of far greater cities.

"Bucholz" (13) is a lively sensational tale of a series already familiar to English lovers of such writing. Those may criticize Mr. Fischer's Centennial Poem (14) who can read the dialect in which it is written. A new edition of Washington Irving's most celebrated and characteristic work (15) will be welcome to a generation which knows him better by name than by study.

The Archæological Institute of America (16) is doing useful work at home and abroad; the antiquities of the Western continent are richer than is commonly known, and their history is to a great extent still virgin soil.

Of technical works on special subjects—lessons on bridge-construction (17), familiar text-[illegible] (18), treatises on orthopædic surgery (19), and the [illegible], of morphine (20), it is enough in this place to give the names.

THE EASTERN DEADLOCK.

THE deadlock in the Adriatic has drawn upon England during the past week mingled ridicule and querulous remonstrances from half the organs of European opinion for having led the Powers into the imbroglio. The resolution of the Porte and the irresolution of Montenegro may probably have been equally surprising to Mr. GLADSTONE. But Prince NICHOLAS does not usually act or refuse to act without counsel from above, and the suggestion that the scene of the naval operations should be transferred from the Adriatic to the Sea of Marmora might be in many ways convenient to Russia. That an English fleet should threaten Constantinople because the SULTAN refuses to abandon his subjects to the hated sway of the Montenegrins might seem a thing too monstrous to be even imagined. But all impossibles become possible in face of Mr. GLADSTONE's blind obstinacy and reckless partisanship, unchecked by Parliament and encouraged by the noisiest, if not the most respectable or trustworthy, expressions of public opinion. For this reason, if for no other, it may seem to be unwise of the SULTAN to give any excuse for extreme action either at Dulcigno or elsewhere, inasmuch as the letter of his engagements is against him, and therefore the Powers in their quarrel with Turkey have at present legal right on their side. The Albanians, as long as they were principals in the dispute, although they had no diplomatic standing, seemed to have a moral claim to consideration. In theory, districts, provinces, and even separate races and languages are unknown to international law. Governments only recognize Governments, which are supposed exclusively to represent and absolutely to control all their respective subjects. In conformity with precedent, the Turkish Plenipotentiaries at Berlin were entitled, if their concession was subsequently ratified, to transfer to Montenegro any territory which was nominally included in the Empire. The other parties to the treaty had a corresponding right to exact the performance of its conditions. Whatever might be the sentiments of the Albanians, the Porte was both authorized and bound to enforce the stipulated surrender, and, in its default, the Great Powers might execute the decisions of the Congress. The case was not substantially altered by subsequent transactions. The agreement which was negotiated by Count CORTI provided a substitute for parts of the district ceded by the treaty, and a second transaction of the same kind ultimately designated Dulcigno as the subject-matter to which the provisions of the treaty were to apply. The SULTAN had in both the successive negotiations acknowledged the validity of the treaty. It was not at that time suggested that the inhabitants of the ceded district were in any way to be consulted or considered. The Ambassadors at Constantinople were from time to time assured that the surrender would be in due time completed, though successive delays were proposed and allowed on plausible grounds. The Turkish troops at Scutari were ostensibly charged with the duty of overawing local malcontents who might throw impediments in the way of the transfer. By degrees greater and greater stress was laid on the repugnance of the local tribes to the sovereignty of the Montenegrins, who were said to be their hereditary enemies. Modern public opinion has diverged widely from the rules of international law; and it was and is felt that it is often an abuse of power to change the allegiance of any population without its consent.

It is now clear that the Albanians are not really principals in the dispute. The number of their forces is variously estimated, but it seems doubtful whether they are either able or willing to oppose a single-handed resistance to the Montenegrins. There can be no question that the Mahometan part of the population regards the cession with repugnance; and probably the Catholic tribes would prefer the nominal supremacy of the SULTAN to incorporation in an Orthodox community; but it is uncertain whether any warlike operations would have been necessary if the Turkish Government had complied with its undertaking. The Montenegrin commander professed confidence in his ability to overcome the Albanians, but he was afraid of the superior arms and discipline of the Turkish regular troops. RIZA PASHA, who seems to be a loyal soldier, informed the emissary of the English Admiral that he had no orders to surrender any territory, and he is undoubtedly discharging his duty in opposing invasion by force. It is not his business to interpret or to execute the Treaty of Berlin, but to obey the commands of his Sovereign and to repel attacks on his dominions. The SULTAN has by his latest communication placed himself formally in the wrong. He might have alleged, in extenuation of his neglect to perform his obligations, inability or unwillingness to compel the transfer of a Mussulman population to infidel rule. The allied Powers would still have been technically within their right; but the moral justice of their cause would have been as disputable as the soundness of their policy is actually doubtful. The SULTAN has been ill advised in placing his default on other grounds, and in imposing arbitrary and irrelevant conditions on the discharge of his obligations.

It is said that the SULTAN drew up with his own hand the document in which he defies the European Powers. The declaration is on its face not without dignity and plausibility; but it amounts to a direct violation of the Treaty of Berlin. The Powers are required as a preliminary condition of the surrender of Dulcigno to abandon the naval demonstration, and they are also asked to promise that it shall not be repeated. Minor stipulations as to securities for the civil and religious rights of the new subjects of Montenegro are only inserted as matters of form. It is conjectured that the audacious demand for the withdrawal of the fleet was suggested by an apprehension that after the surrender of Dulcigno the combined squadron would sail to the Gulf of Volo for the purpose of enforcing the decision of the late Conference of Berlin. If such an operation is intended, it will not be in any way impeded by the Turkish protest. If it is true that MUSURUS PASHA has on this question been the chief adviser of the SULTAN, he has made a bad use of his long experience of English feeling and opinion. It is true that the naval demonstration, with its probable consequence of war with Turkey, is widely and justly disapproved; but the imprudence of a collision with united Europe is not less obvious. The contumacy of the Porte and the Palace has been generally attributed to a belief that the existing concert would not survive the immediate occasion. It would have been prudent to wait till the hope of disagreement was realized. The Governments which are supposed to be less zealous than their allies in the cause of Montenegro will scarcely instruct their Admirals to withhold co-operation when

hostilities have commenced, though it seems to be certain that the French contingent will merely look on. The SULTAN has practically played into Mr. GLADSTONE's hands, though he has falsified the repeated and confident prediction that the concert of Europe would ensure submission.

If the Turks have disregarded the rules of prudence and the stipulations of treaties, it by no means follows that the policy of the English Government is either wise or justifiable. Two years ago a war with Russia was with great difficulty avoided by the late Ministry. Mr. GLADSTONE and his colleagues have probably precipitated a rupture with Turkey in the absence of any obligation of interest or duty. The right of enforcing a treaty imposes no corresponding burden. England was not bound to provide the Montenegrins with additional territory, even if they had been, as their enthusiastic patron called them, the most heroic race in Europe. In one sense it has been a considerable diplomatic achievement to unite the Great Powers in an enterprise devised by England for the benefit of Russia; but the hope that the object would be peaceably attained has been signally disappointed. The present crisis retrospectively illustrates the alleged error of Lord BEACONSFIELD and Lord DERBY in refusing to sign the Berlin Memorandum. That much-disputed document provided for the contingency of armed interference in Turkey; and though the Liberal party at the time almost unanimously approved the decision of the Government, some of their leaders have since declared that the neglect of an opportunity to arrange European concert was the cause of the long-prepared Russian invasion and of all the complications which have ensued. It is impossible to determine whether ABDUL AZIZ would have been more amenable to combined pressure than his timid and subtle successor; but at that time the Turkish Government was formidable by land and by sea, and the Mahometan population was more likely than at present to deem itself invincible. The SULTAN might or might not have yielded to threats; but, if he had resisted, the alternative would, as at present, have been an unprovoked war. Four years ago no considerable party in England had renounced the traditions of national policy which have still many supporters. It was not till after the date of the Berlin Memorandum that the Bulgarian agitation drove all the sentimentalists and almost all the democrats into the arms of Russia. The three EMPERORS who contemptuously demanded the adhesion of England to the Memorandum at twenty-four hours' notice already meditated a forcible occupation of some of the Turkish provinces. Those who censured the course of Lord DERBY have always relied on the efficacy of the threat which might then have been addressed to Turkey. After all the losses of the war the SULTAN seems determined to yield nothing except to force. He may probably succeed in disclosing the incomplete or precarious character of the European concert; but there will be little satisfaction in convicting Mr. GLADSTONE of rashness, if an opportunity is afforded to Russia of once more intervening in Turkish affairs.

THE MAIWAND DESPATCHES.

THE despatches giving the story of the Maiwand disaster have been published in India, and the substance of these despatches has been telegraphed to England. Their publication in India has been accompanied by a criticism of the VICEROY and the COMMANDER-IN-CHIEF, both of whom pronounce the despatches to be eminently unsatisfactory. It is said that they do not give any account of the precautions taken to ascertain the position and strength of AYOUB, and that they do not sufficiently explain the causes of the disaster. It might be added that they do not explain why the battle of Maiwand was ever fought. What General PRIMROSE does tell us is that in June the Political Agent was of opinion that active support should be given to the WALI, who was then with his troops at Girishk. He therefore recommended that a brigade of infantry, a regiment of cavalry, and a battery of horse-artillery should be despatched to the Helmund. On the 1st of July the Government sanctioned this step; but ordered that the Helmund should not be crossed, that there should be no weakening of the Khelat-i-Ghilzai garrison, or of the line of communications, but that reserves should be pushed forward by forced marches. General BURROWS was accordingly sent towards the Helmund on the 3rd of July, only somewhat upwards of 2,400 men being left in Candahar. But General PRIMROSE considered his position there perfectly safe, as, he expected to be strongly reinforced in rather less than three weeks. He left General BURROWS to act according to the best of his judgment, but gave him orders, under directions from Simla, to prevent AYOUB slipping past Candahar without being attacked. Apparently these orders were given while it was supposed that the troops of the WALI would fight loyally by the side of the British force. But they were not in any way altered after the defection of the large part of the WALI's troops became known. The position of General BURROWS, therefore, was this. His superiors knew that the British force under his command was very small, that no reliance could be placed on the support of the WALI's troops, while they did not know where AYOUB was or how many men and guns he had with him; and under these circumstances General BURROWS was ordered not to let AYOUB slip past Candahar without being attacked.

General BURROWS says that, owing to the mutiny in the WALI's army, the political influence of the British was at an end and every man's hand was against him. He could not procure any trustworthy information; but at last he heard that AYOUB was making for Maiwand, and he determined to try to intercept him there. He was obliged to take with him all his stores and baggage, as he could not leave anything behind him in a hostile country without a guard, and his force was too small to permit him to divide it. He set out in the early morning of July 27th, and, after he had marched eight miles, the enemy was in sight, at a distance of five miles. General BURROWS estimated the force opposed to him at about twenty-five thousand men, or a superiority to his own force of about ten to one; but he determined at once to attack. He got his men into position with the guns in the centre, the cavalry on the left, and the infantry on the right. Some time for repose was given to the men, and then, at 11.45, the battle was begun by Lieutenant MACLAINE's advanced guns. It is said that this officer acted without instructions, and that orderlies were sent to recall him, but that it was too late. For more than two hours the British troops maintained what for an attacking army may be called a successful defence. The artillery, we are told, made excellent practice, the cavalry held that of the enemy in check, and the infantry kept up a steady fire. At 2.30 the enemy made his serious attack. The Ghazis made a rush on the centre to seize the guns. The fire with which they were received failed to check them, and they got possession of two advanced guns. Then came the critical moment. If the infantry had but stood firm, all might still have gone well, in the opinion of General BURROWS, and his opinion is confirmed by that of the COMMANDER-IN-CHIEF. But the infantry gave way, and, commencing from the left, rolled up like a wave to the right. The only hope was that the cavalry might retrieve the day; but they had been so terribly shaken by the artillery force to which they had been exposed that they were utterly demoralized. They would not follow their officers; and, although a portion of the cavalry made a charge, this charge was only faintly delivered, and produced no effect. The British force was utterly routed, and all the General could do was to try to make something like an orderly retreat. Fortunately the enemy did not pursue with any vigour, although they had every encouragement to do so, as the British officers could not get their men to rally and face the enemy; and it is mentioned as an exceptional fact that one officer was so far successful as to get his men to fire two or three volleys during the retreat. After nightfall the force was fired upon from every village through which it passed until it reached Koheran, and General BURROWS states that the guns were lost because Lieutenant MACLAINE waited to fire another round after he had received orders to limber up and retire.

The telegraphic summary informs us that the VICEROY considers the despatches as meagre and unsatisfactory, and as leaving the Government in ignorance of the true facts of the case and the real causes of the reverse. Lord RIPON cannot be supposed to have used language so severe without good reason. General BURROWS tells his story, and certainly up to a point it is an intelligible story. He was under positive orders to attack, however large the force of the enemy might be, so as to prevent him from slipping past Candahar. He came to the conclusion that unless the enemy was checked at Maiwand he would slip past Candahar. He therefore attacked. His attack was from the outset a defence, and

when the enemy made a serious attack his troops were panic-stricken, and could not be got to fight. Some of the troops fought splendidly, and the VICEROY pays a deserved tribute to the gallantry of the 66th Regiment and the artillery; but the bulk of the cavalry and the infantry were demoralized, and too frightened to hold their ground. The army was utterly beaten; but it was not annihilated, because the enemy did not pursue. This is the story of the battle of Maiwand, and it certainly seems to give at least the outline of what happened. What it does not explain is why General BURROWS fought when he did and where he did. It does not explain why he fought in circumstances which gave every advantage of position to the enemy and none to him. Subsequent reports from officers of the force of General ROBERTS have made it clear that AYOUB had much more than a vast superiority of numbers on his side. He had much stronger artillery, and above all his troops were so placed that they were well sheltered, and were protected by so many natural and artificial obstacles that it would have been almost impossible to dislodge them. The British force was obliged to act on the defensive, not only because it was small, but because it had no chance of attacking successfully. It was, on the other hand, very unfavourably placed for defence. The cavalry was so exposed that it was cut to pieces by the enemy's fire before it could be brought into action. It held the enemy's cavalry in check for a time, but while it was checking the enemy's cavalry it was being crushed by the enemy's artillery. There can be no doubt that the enemy lost severely during the engagement. The dead bodies found by those who visited the spot after the victory of General ROBERTS sufficiently testify to this. The British artillery made good practice, and the fire of the British infantry while it did fire was effective. The few British troops who died rather than run away sold their lives dearly. But the enemy could afford to lose heavily, and when it became obvious that the British were being inevitably forced to fight a merely defensive engagement, the vast numerical superiority of the Afghans told. All the history of our wars with semi-barbarous tribes teaches us that the armies of such tribes, although liable to yield to the resolute attack of a comparatively small force of civilized, disciplined, and well-armed men, will also show the greatest gallantry in attacking a small force of this kind when they have it at a disadvantage. It was perhaps natural enough that General BURROWS should not suppose that his troops would behave as badly as they behaved at Maiwand, though the disinclination of Bombay troops to meet Afghans is no novelty. But, on the other hand, it would seem, so far as is as yet known, that, from want of proper precautions in obtaining information as to the strength of AYOUB's position, from mere blundering, or from some other cause, he chose to make his men fight in circumstances which put them to a great disadvantage.

AGITATION AND MURDER.

LORD MOUNTMORRES is the second Irish peer who has been murdered within two or three years. It is said that he had lately been engaged in disputes with his tenants; but there is no reason to assume that he was in the wrong. It is highly probable that in opposing their claims and prejudices he may have consulted their best interests, while he had the courage to assert the rights of property on which civilisation and the possible improvement of Ireland depend. Mr. BENCE JONES, in an admirable account of the administration of his own estate, published in *Macmillan's Magazine* for last April, fully explains the process by which a firm and sagacious landowner combines the abolition of poverty and distress with the increase of his own revenue. It is not surprising that he has since been held up by the orators of the Land League as a fit object of popular vengeance; but fortunately he is not an inhabitant of Connaught. Mr. TUKE, in the account of his visit to some of the distressed Western districts, is never tired of expatiating on the evils which result from the non-residence of landlords. His strictures on the neglect of their duties by absentees would be more effective if residents were not exposed to greater unpopularity and to serious danger. Lord LEITRIM was personally unpopular, both through faults of temper and demeanour, and because he was a beneficent if not a benevolent despot. He governed his tenantry on the whole for their good, but he insisted on obedience to his will. The agitators have consequently not concealed their approval of the murder; and one of them had the audacity to defend the crime in the House of Commons. There was apparently no reason to suppose that the attacks which have been made by the accomplices of assassination on the character of Lord LEITRIM can, even by the shameless gang of demagogues, be repeated in the case of Lord MOUNTMORRES; but the priest of the parish, a well-known Land League agitator, took occasion on the Sunday following the murder to accuse the victim of being a bad landlord. The same person professed to believe that his flock were innocent of the crime, although some of them trampled publicly in his blood, and although the undertaker's men were afraid to put the body in the coffin. Every parishioner will, with or without reason, be satisfied that his priest approves the murder, in which all the neighbours are probably accomplices.

The murder of a peer is not a greater crime than the murder of a peasant; but it may possibly attract more attention to the misgovernment which renders such atrocities possible and common. Neither political party is entitled to immunity from the charge of cultivating popularity by deference to cant. Every Minister in turn pretends or fancies an almost insuperable objection to any suspension of the liberties which are supposed to be a part of the Constitution. A true statesman would feel that it was his paramount and transcendent duty to protect life and property, having first obtained the authority which Parliament has the constitutional right to bestow. Murderers are allowed to buy weapons, sometimes from Government stores, with the notorious purpose of using them against offenders who violate the rules enacted by lawless mobs at the instance of the PARNELLS, the BIGGARS, and the SULLIVANS. The balance of gain and loss is variously estimated by the representatives of conflicting interests and by impartial observers. A landowner is shot in the back by hired assassins as he rides over his own estate; but a member of the Cabinet is cordially welcomed on a visit to Donegal by assemblages which in turn receive his assurance that four at least of the Ministers are bent on redressing the supposed grievances of the Irish tenantry. It was probably by an oversight that Mr. CHILDERS distinguished himself, Mr. GLADSTONE, Mr. BRIGHT, and Mr. FORSTER from all their colleagues. The PRIME MINISTER and Mr. FORSTER are primarily responsible for the continued determination to allow the spread of crime and anarchy in preference to the provision of remedies outside the range of ordinary law. Mr. FORSTER indeed at the end of the Session recognized as possible the contingency of applying to Parliament for extraordinary powers; but he was careful to add that he would simultaneously promote legislation for the punishment of landlords who might exercise their legal rights in such a manner as to incur his moral disapprobation. In extreme need measures are to be taken to repel the assaults of the wolves on the fold; but impartial justice requires that corresponding penalties shall be inflicted on sheep suspected of a tendency to stray.

It is true that murders might from time to time have been perpetrated even if the Government, preferring its duty to its own interest, had continued or extended the Peace Preservation Act; but obstacles would have been placed in the way of the acquisition of firearms, and the police would have been enabled to exercise a more effective supervision over suspected persons. It is well known that the executors of the popular will are always strangers hired at a cheap rate to commit, amid general approval, the foulest of crimes. The presence of professional assassins in any district would attract notice, and sometimes it might lead to the precautionary apprehension of the criminals. Experience has shown that the various Coercion Acts have at all times more or less perfectly attained their object. In case of need the Government for the time being ought to demand from Parliament, as a condition of retaining office, the further power of suspending trial by jury, if murderers are still permitted to escape; but it will probably not be necessary to proceed to such an extreme. Juries have at present few opportunities of failing to discharge their duties, because evidence is seldom forthcoming against agrarian murderers. In some cases the criminals are well known to the police; but it is not surprising that witnesses are afraid to tell the truth. An impudent ruffian, a waiter at an inn, a few days since openly threatened a witness in the presence of the magis-

trates who were bearing the charge. The lowest classes in Ireland readily learn from their self-appointed teachers the lesson that the distinction between right and wrong is most effectually obliterated by the unrestricted expression of immoral doctrines. In less abnormal states of society men hardly know how largely virtue and conscience depend on tacit assumption and on decent reticence. The Decalogue would lose, not its value, but its influence on popular belief, if it were habitually regarded as a series of open questions. When mischievous sophists have once reduced commandments to the level of logical conclusions, stump orators have no difficulty in producing arguments on the other side which are good enough for the mob.

If crimes of violence cannot be wholly prevented, it is at least possible to suppress their principal cause. The wicked declamations of the Land League furnish to the demoralized audience more than sufficient reasons for murdering landlords, and for maltreating peasant violators of the agrarian code. Neither Mr. PARNELL nor his lay and clerical accomplices recommend—perhaps they scarcely desire—the murder of the owners, whom they merely wish to deprive of their property; but they cannot fail to know that their disciples will employ their own familiar methods of practising the doctrines which the agitators preach. Mr. PARNELL openly vindicated the brutal murder of Mr. BOYD by remarking that it would have been unnecessary if the people had been properly organized. As they had delayed their adherence to the Land League, it was, it seems, necessary to murder, not a landlord who asserted his rights, but his innocent son. The tenants are again and again exhorted to defy not only the law, but the common rules of honesty, by refusing to pay their stipulated rents, unless in their own discretion they consider them just. The orators of course intimate to hearers sufficiently intelligent to understand a fraudulent hint that the rent is to be reduced to small or evanescent proportions. As a further encouragement to dishonesty, the occupiers are told that, if the landlords decline their present offers, the League will probably a year hence decree the total abolition of rent. A burglar might, with equal regard to morality, be encouraged to content himself with half the plate in the pantry by the assurance that, if he waited, he should have the whole. There is no use in reasoning with the wilful enemies of law and order, or even in denouncing their guilt. The only public opinion for which they care is that of their associates and their leaders. It is perhaps one degree less hopeless to appeal to the Government which tolerates a revolutionary agitation. No sanguine hopes can be entertained of the result of their deliberations on a law for the readjustment of proprietary rights in Ireland. It is extremely doubtful whether the Act of 1870 has done more good or harm, and any future legislation indicated by Mr. GLADSTONE will proceed further in the same direction. Whatever may be the provisions of the future Act, it must recognize some right of property, and it will not relieve the Government from the obligation of protecting the peaceable part of the population. To render murder difficult and dangerous, and to silence incitements to crime, are much more certain and more urgent duties than the enactment of the best rural code.

THE PLOT AGAINST THE *LIVADIA*.

JUST as the excitement about the Watford dynamite was settling down into the condition which precedes absolute oblivion, a fresh scare of the same kind, and probably not unconnected with the former, came from Glasgow. There, as diligent readers of their newspapers are aware, lies, and has for some time been lying, all but ready for sea, a new yacht built for the CZAR by some Glasgow shipbuilders. The *Livadia* is one of the numerous, costly, and it may be added hitherto not very successful, experiments of the indefatigable Admiral POPOFF. Upon a huge raft-shaped hull, like an air-cushion, or rather like an inflated John Dory in shape, rises a short superstructure with straight sides, and then a kind of infinitely magnified deckhouse, arranged rather like a sumptuous palace on shore than a confined and awkwardly shaped sea-home. Whether this queer craft will be nautically a success remains to be seen. But she was intended to be something more than a mere pleasure-boat. Her speed was to be very great; her capacity as a troop-ship would, in case of need, be enormous; and, though it would be difficult to armour-plate her in any way, her great low-lying platform, based on a sort of life-raft, divided into an immense number of compartments, could very easily have heavy artillery mounted on it, and would, at least in theory, be almost unsinkable by shot. Hence the *Livadia* would be, if she answered her designer's demands on her, a considerable addition, not merely to the CZAR's comfort, but to the strength of the Russian navy, and she is all the more likely to be the mark of the attempts of the restless conspirators who are ready to strike anywhere at an exposed and vulnerable point. Moreover it was supposed, at any rate at one time, that the Grand Duke CONSTANTINE would himself command the *Livadia* on the voyage to Russia. Thus a remarkable opportunity of killing divers birds with one stone presented itself to the Nihilists, who, it may be added, are also, since the semi-official statement that the dynamite found at Watford had been in all probability lying there for some days, strongly suspected of the attempt to blow up the North-Western train. The *Livadia*, it should be observed, from her peculiar construction, offers a good deal of temptation to the particular form of destructive agency supposed to have been adopted.

Of the main facts there seems to be no doubt; which is a good deal more than can be said for the former attempt. It is said positively that information was received a week ago from St. Petersburg, and also from Geneva, a great haunt of Russian malcontents, that three men had left London with "Thomas" clocks intended for the destruction of the yacht. These ingenious devices, it may be remembered, are named from, and were first employed by, the author of the Bremen explosion. Nitroglycerine is the explosive agent, and in the case is included a piece of mechanism going by clockwork for as many days as may be thought proper. At the conclusion of the time, and not before, a hammer strikes the detonating fuse connected with the nitroglycerine, and the explosion takes place. Although those clocks have been much talked of, it is not to be supposed that many people have been actually acquainted with them; but there is nothing mysterious in their construction, though whether it is possible to obviate the risk of a premature explosion from some chance concussion is indeed not quite clear. In a trading-ship they can of course be concealed very conveniently among parcels of merchandise or passengers' luggage. But a favourite notion as to their use is that they should be concealed among the coals; romance, if not history, going so far as to say that they have been or may be fashioned so as to look like large blocks of the fuel and thus to escape detection. The coal bunkers in the *Livadia* are in the lowest part of the structure, and therefore excellently situated for the production of the most destructive explosion. Further, it is said that the three persons indicated actually endeavoured to obtain access to the *Livadia*, which was naturally an object of great curiosity to Glasgow sightseers. But warning had been received in time, and, on a different pretext, visitors were excluded. Since that time the *Livadia* has been guarded with a good deal more care than most ships of war off an enemy's coast. Nobody is admitted into the yard without giving ample explanations; detectives wander about the yard and the ship herself; the coal already on board has been taken out and examined, and everything admitted on board in future is to be poked and probed with the assiduity of the most jealous exciseman. Bold as well as wary as the Nihilists have more than once proved themselves, it not very likely that they will endeavour to elude this vigilance just now. Yet it is only fair to remember that the explosion at the Winter Palace took place under conditions apparently far more prohibitory than any which can apply to the *Livadia*. An immense number of workmen, sailors, and others must be perforce admitted to the ship for whom it would be very difficult for anyone personally to answer. The examination of the coal more particularly suggests itself as an extremely difficult business to carry out thoroughly. On the whole, it is probable that only those persons who are ardently in quest of a new sensation would care to accept a berth on board the *Livadia* for the trip to the place whence she takes her name, despite the promise of next to no motion, of lofty courts and halls instead of stifling cabins, and even of flower-gardens and other phenomenal luxuries to relieve and contrast with the monotony of the sea.

It is impossible, taking the facts as stated, to resist the conclusion that the Nihilists are by no means inclined to give up the game, or to abandon their old way of playing it, despite

the comparative lull which the iron hand and velvet glove of General LORIS MELIKOFF have together brought about of late in Russia itself. It is, to say the least, unpleasant, and, to say more than the least, somewhat ungrateful, that they should choose England for the scene of their operations. When they were first suspected of the Watford affair, it was stated that the police had with some simplicity requested the best-known Nihilists resident in England to say whether they had had anything to do with it, and had (strange to say) received an indignant denial, couched in terms expressing a very noble sense of English hospitality. Putting the former incident out of the question, this latest attempt does not seem to argue the existence of such a sense in any very lively form. The Nihilists might argue that they only intended to blow up a Russian ship carrying a Russian crew on the high seas. Unluckily, as their inventor found, nitroglycerine clocks are no more certain to keep time than other clocks, and a premature explosion would have at least unpleasant effects on a large number of perfectly innocent people in Messrs. ELDER's employ. This consideration, however, is one that rarely deters the Continental, or, for the matter of that, the Irish conspirator. Both are too logical to look at anything but the connexion between the end and the means, and we have no doubt that the horror felt by ORSINI's English sympathizers at his waste of innocent blood seemed to his Continental friends as much cant as English sympathy with Irish cattle seems to Mr. DILLON and his colleagues. In such incidents as the Glasgow scare we pay the penalty for being first a hospitable and then a commercial nation. "If you "did not build ships for the CZAR," the person with the clocks would doubtless say, "I should not blow them up." At the same time it must be admitted that for nervous people these perpetual scares are rather trying. To blow up something is very easy, and dynamite has not the slightest respect for persons. If Mr. BIGGAR himself had been in the train at Watford, and the fuse had not gone wrong, all his sympathy with HARTMANN would not have saved him from a practical experience of the method he recommends. Therefore, on the whole, it will be satisfactory when the *Livadia* and her crew, and her designer and her commander, and all the rest of her belongings, are well out of the country. At present Glasgow, not an attractive place at any time, may be said to have become less attractive than ever. The incident is a serious, and yet at the same time a half ludicrous, commentary on what is grandly called the solidarity of peoples. We have absolutely nothing to do with the quarrels between the Czar of RUSSIA and his subjects, and it is somewhat trying that the field of battle should be transferred to our railways and shipyards. Foreigners would tell us that we have only to thank the indiscriminateness of our reception of strangers, and the feebleness of our police. But the triumphs of the Continental police itself over determined malcontents well provided with money cannot be said to have been of late years either numerous or convincing. There is, therefore, nothing for it but philosophy and a reliance on the chapter of accidents. The singular duel between the Glasgow police and the three Nihilists will, however, continue to be watched with interest. There is, we suppose, no legal reason for arresting these worthies, and the mere possession of a nitroglycerine clock could hardly be made an offence. But really we have at the present moment quite a sufficient supply of bloodthirsty scoundrels to deal with at home, and it would be obliging of the Nihilists not to make further contributions to the list.

THE AMERICAN PRESIDENCY.

THE contest for the American Presidency will for two months more furnish mild excitement to a great community; but it has not on any former occasion been found so difficult to create a serious interest in a comparison of the numbers of the two parties. Perhaps the most remarkable incident of the conflict thus far is a speech by General GRANT, probably the longest he ever delivered, at a Republican meeting in Ohio, which is chiefly important as assuring the Republican candidate of the undivided support of General GRANT's adherents. The candidates on both sides are highly respectable, and there is nothing in their character or history to excite enthusiasm. General HANCOCK was one of the most meritorious general officers in the Civil War; but his exploits were performed seventeen or eighteen years ago, and he relies mainly on the support of the combatants whom he helped to defeat. Mr. ENGLISH, the Democratic candidate for the Vice-Presidency, is acceptable to his supporters because he is reputed to be rich; and his enemies have invented no more formidable imputation on his character than the highly improbable statement that he made his money by buying up bad or doubtful debts. Bolder controversialists asserted that the Democrats would, if they succeeded, recognize the liabilities of the Confederate Government. It is surprising that such a rumour should attract even temporary notice; yet General HANCOCK has thought it worth while publicly to repudiate a policy which he could certainly, even if he were inclined, not practise as a President. It is doubtful whether such charges or contradictions affect the result of the election, but they amuse public meetings and readers of newspapers, without causing any inconvenient agitation. Probably not a single voter will join or abandon either party through any hope or fear as to imaginary dealings with the Confederate debt. The strongest motive on which the managers of the contest rely is the natural desire to be on the winning side. Nine-tenths of the speeches and newspaper articles which occupy public attention are devoted to the assertion or attempted proof that HANCOCK or GARFIELD, as the case may be, is destined to succeed. Writers and orators unconsciously imitate HOMER and MILTON in the exhibition of balances inclining to the party which is to be eventually victorious. Foreigners not immediately concerned cannot but accept the indigenous estimate of the struggle. As in the Derby or the St. Leger, the question is not which is the best horse, but which is likely to come in first.

Though it is nearly certain that the Southern States will unanimously support the Democratic candidates, the Republicans profess an uncertain hope of rescuing Virginia and South Carolina from their opponents. While in the North they represent themselves as champions of public credit, they watch with interest and sympathy a schism in the Democratic party in Virginia between two local factions respectively known as Funders and Readjusters. The proposed subject of readjustment, which means partial repudiation, is the State debt of Virginia. The Republicans have no hope of conciliating the comparatively honest Funders, but they take frequent opportunities of reminding the Readjusters that the Presidential election will enable them to assert their right of controlling the State Democracy. For the present both sections of the Democratic party in Virginia support HANCOCK and ENGLISH, and they will probably fight out their local quarrel on some other occasion. In South Carolina the Republicans prepare for defeat by complaining beforehand that the majority which they affect to anticipate will be destroyed by fraudulent counting of votes. On the whole, it can scarcely be doubted that the cant phrase of "the solid South" will represent the result of the election. If no defection takes place, the Democrats must also secure about fifty Northern votes. At present their prospects appear, notwithstanding the vapouring of Republican Committees and Clubs, to be not discouraging. No internal feud will be allowed to divide their strength in any Northern State. The Tammany faction in New York has, since the rejection of TILDEN as a candidate, resumed its party allegiance; and the Republicans seem to have no serious hope of carrying the State against the vast Democratic majority in the city. The Democrats, who habitually denounce their opponents as Radicals, include in their ranks the lowest of the rabble.

In the early deliberations after the Chicago nomination the Republican managers summarily declined all invitations to waste their eloquence and their energies in futile attempts to convert the obstinate South. Party statistics furnished them with the means of estimating their strength in the various Northern States; and, while they gave up New York as lost, and relied on the fidelity to their cause of nearly all the other States, they fastened upon Maine and Indiana as districts which might be lost or won by greater or less exertion. The State elections of September and October were expected to foreshadow the result of the voting for Presidential electors in November; and several of the principal orators were at once detailed for service in Maine. In that State the pure Democrats were in an acknowledged minority; but the Greenback party, or advocates of repudiation in the form of an inconvertible currency, commanded a considerable number of votes. After much negotiation, the Greenbackers and Democrats agreed

to act together under the appropriate title of Fusionists. After a severe contest the Fusionist candidate, Mr. PLAISTED, was elected Governor; but the Republicans command both branches of the State Legislature, and they will consequently be able to return the United States Senator on an approaching vacancy. A contest which was all but drawn leaves the result of the Presidential election in the State uncertain; but the Republicans are deeply disappointed, and their adversaries profess corresponding exultation. The Democrats are naturally gratified by even a partial victory in a typical New England State. Their consciences will not be greatly troubled by the allegation that they spent large sums in indirect corruption. The pretended expenditure of 20,000*l.*, even if it had been proved, is not excessive according to the English scale of election expenses. Until lately charges of actual bribery of voters were almost unknown in the United States, and the accusation is still probably in the majority of cases unfounded. Universal suffrage, among many demerits, has the solitary advantage of reducing the pecuniary value of a vote to an amount which is not worth paying or receiving. The enormous expense which is nevertheless incurred consists in the cost of delegations, of public meetings, of flags, of music, and of similar forms of outlay. The Republicans loudly and justly boast of their great superiority of resources. They include in their ranks a large proportion of the wealthier classes, and, as long as they retain office, they have the means of levying a percentage on the salaries of public servants. Both parties are probably at the present moment indulging in lavish expenditure.

Indiana at least will not be lost to either party through want of money or unwillingness to spend it. If the Democrats can carry the State, they will, even if they are defeated in Maine, return their nominee as President. Strangers would be ill advised in forming any confident judgment on the result of the decisive contest. The hard-won victory of the Fusionist candidate in Maine naturally encourages the Democrats, although it is not certain that the Greenback party disposes of any considerable number of votes in Indiana. Mr. ENGLISH was nominated Vice-President as a citizen of Indiana in compliment to the State; and it may be presumed that he will contribute largely in money, and that he will exercise all his personal influence. Even before General GRANT'S speech the Democrats had abandoned all hope of carrying the neighbouring State of Ohio; but Indiana will be sufficient for the purpose. The moderate curiosity which attends the struggle will not be satisfied till the State election is decided. There is no such commodity as authentic information. Both parties will boast till assertions cease to be useful, and there is no reason for believing one set of assertions in preference to the opposite. In the meantime many brass bands will fill up the intervals of innumerable speeches mainly devoted to the confident enumeration of doubtful votes. Little oratory is wasted on the supposed issues of a contest which will have but an imperceptible influence on policy and legislation. The Republicans are somewhat more earnestly devoted than their adversaries to the worst of all possible commercial systems; while the Democrats are supposed to offer insufficient guarantees for the rights of the Southern negroes. It is well known to the millions of Americans who excite themselves about the Presidential election that the tariff will be maintained, and that the country will nevertheless continue to prosper, whether HANCOCK or GARFIELD is elected. It is generally believed that the highest or most cultivated class scarcely affects to concern itself with the details of political activity. Equality can only exist at a low level, and attempts to rise above it are naturally considered invidious. Such a country as the United States can afford to dispense with great men, and it contrives to govern itself tolerably well without them. There is comparatively little for the Federal Government to do, because the States, the counties, and the townships manage their own affairs.

THE LONDON SCHOOL BOARD.

THE address of the CHAIRMAN of the London School Board derives special importance from the time when it was made. The Board has now been at work for ten years, and Sir CHARLES REED is able to sum up the results of a decade. It is a period sufficiently long to yield materials for looking at the work of the Board as a whole, and for seeing what the Board has done, what it has not done, and what it has a prospect of doing hereafter. The Board has been composed for the most part of zealous and capable persons, it has enjoyed the command of vast sums of money, and it has been working in a time when the whole current of opinion in all classes is in favour of education. The value of the two latter of these advantages must always be taken into account when the work of the Board schools is compared with that of the older voluntary schools. The founders and managers of voluntary schools in old days were conscientious, high-spirited men and women who put themselves to much trouble because they believed they were doing an obvious duty. But they had great difficulty in getting funds, and they had to face a state of things which obstructed education at every turn. The poor had no conception what education meant, and looked on it mainly as a device of the clergyman and the squire for preventing children from earning their bread. The rich often gave money because they were shamed into giving it, but in their hearts thought that learning made the poor conceited and useless. They also did not like the ancient order of things to be changed, and associated on good grounds the advance of education with the advance of democracy. The Act of 1870 was not only a powerful instrument in altering the mode of regarding education, but was itself a sign that the alteration had begun. The School Board came into existence at a moment when the uses and necessity of education were beginning to be appreciated. Every year it has seen this recognition become more hearty and general. The poor wish to be educated, the rich wish them to be educated. The ratepayers of London pay without serious murmuring the enormous sums which are annually placed at the disposal of the Board. The poor readily send their children to school, and Sir CHARLES REED had the satisfaction of describing the eagerness with which parents now flock to the ceremony of opening a new school. Nor does the interest of the poor in education limit itself to attending a ceremony or sending their children to school. They are continually making nearer approaches to sending their children tolerably clean and tolerably well dressed. The education thus extends to the parents themselves, and they go through various sacrifices to attain this benefit for themselves and their little ones. The children are to some extent forced to attend, and it was because compulsion worked unexpectedly well in London that it was thought possible to make it general through the country. But although parents cannot help sending their children, and therefore the mere attendance at school of a large number of children does not show much beyond the fact that they are there, there is ample evidence to show that the vast majority of parents are well pleased to have their children at school, and would think themselves going down in the world if their children were not to enjoy the advantages by which the children of their neighbours are profiting.

The total number of children in London between the ages of three and thirteen was computed last Midsummer at 740,000. There has been an increase since 1871 of 120,000 in that number, more than a third of the increase having taken place in Lambeth. The voluntary and Board schools together now provide accommodation for half a million children, the provision made by the denominational schools still slightly exceeding that given by the Board schools. Speaking broadly, it may be said that the Board in its ten years of work has given the means of education to a quarter of a million of children. It has acquired 150 freehold sites, and on these sites it has erected, or is erecting, buildings of a substantial, complete, and even imposing kind. As it costs about 9*l.* per child to give this accommodation, it is not surprising that the ratepayers have had to pay heavily for what has been done. Of course the Board schools are steadily gaining on the voluntary schools, for they have a continued influx of fresh money to work with, and if there is any cause for wonder it is that the denominational schools have held their ground so well as they have done. But they had the buildings to begin with, and compulsion worked in their favour as well as in favour of the Board schools. As the parents found they must send their children somewhere, they were naturally inclined in many cases to gratify the minister of the denomination to which they belonged by sending their children to the school which he recommended. There is now accommodation for rather a larger number than are on the school rolls, and out of the children on the rolls 373,000 attend. The attendance at

the Board Schools appears to be better than at the voluntary schools, and this superiority may be attributed to the greater energy with which the Board enforces its statutory powers to compel attendance. The Board is continually looking up the parents, and the parents, as a rule, comply with the law when its provisions are made known to them. In the half-year ending at Midsummer, the preliminary notice to parents was issued in 36,000 cases, with the result of attendance being given or improved in 26,000 cases. In the same period summonses were taken out in 3,000 cases, and in all these cases the order to attend school was obeyed or a small fine imposed. The Education Department has cordially recognised the discretion and leniency with which the Board has in most cases exercised its compulsory powers, and, now that education has been made compulsory everywhere, the London Board will receive a special reward for having set a good example. It is stated that there are numbers of idle children who now flock into the metropolis from the suburbs in order to escape school, and these children will now be forced to attend school in the districts to which they belong, and will relieve the Board from the imputation of allowing children to be in the streets without anything being done for them. Sir Charles Reed allows that many children attend the Board schools who ought not to receive the education they get there at the price at which they receive it. They pay only a trifle over twopence a week, whereas their parents can well afford to pay three or four times that sum for their education. This is unfair on the ratepayers, who ought to receive larger contributions from parents who are comparatively well-to-do. But Sir Charles Reed, while recognizing this unfairness, says that it is unavoidable, as different rates of payment cannot be enforced in the same school; and he is further able to say that there is no school in which the main work done is not so far rough work that the children of the very poor find a place there, and have every possible attention paid to them.

When we know how many children can go to school and how many actually go, the next thing to ask is what they are taught there. The ratepayers are quite willing to pay for elementary education, because the children of the poor could not be educated at all unless they were helped. But the ratepayers are reasonably unwilling to pay for a higher education for which those who wish their children to enjoy it, and can give them an opening in life which would make this education profitable, can as a rule very well pay themselves. It is also to be borne in mind that not only is it preposterous that ratepayers should give almost gratuitously a higher education to those who can afford to pay the proper price to secure it, but that it is extremely undesirable in the interests of the class to which such persons belong that secondary education should be got by a sort of side wind into the sphere of the operations of the School Board. What this class wants, and what it has not got, is a general system of secondary education conducted on sound principles and by competent teachers. It will never get such a system introduced if the few who see the importance of a good secondary education can procure it for their children through the bounty of the ratepayers. Sir Charles Reed says that the Board is alive to these obvious truths, and that the education given is mainly elementary. Only sixteen per cent. of the children receive instruction in specific subjects, the remainder being taught merely the three R.'s, and, in the case of those above the first standard, a few simple facts relating to geography and grammar. It is shown, however, that, whether the education given is too high or not, the number of children who at any time are receiving the highest education which the school provides will always be small in proportion to the total number receiving instruction. This total number includes children of all ages between three and thirteen, and the number of those who are little advanced must necessarily preponderate; in any system where children of such various ages are taught together there can scarcely be more than sixteen per cent. in the most forward stage. The question is, What are those in the most forward stage to be taught? They are there, and the School Board must, as Sir Charles Reed urges, teach them as well as it can teach them. In order that monotony, with its accompanying weariness of mind, may be avoided, they must have a variety of instruction. The Alpine cows escape rinderpest because they feed on a great variety of herbs and grasses; and, by letting his little Alpine herds browse on a good many specific subjects, Sir Charles Reed saves them from intellectual stagnation. The illustration is curious, and perhaps open to criticism. But the difficulty to which Sir Charles Reed points is a serious one. A child comes to school early, is well taught, is quick and attentive. He gets through the education that is strictly elementary long before he is thirteen. The logical thing to do would be to send him away from the school. He has got all that the ratepayers undertook to give him. But practically it would check all interest in his work, both on his part and on that of his parents, if the result of his good behaviour and his exertions was that he was to be cut off from learning sooner than his schoolfellows. If he is not cut off, and is kept until he is thirteen, he must be taught something that is worth his knowing. He must be allowed to go forward, and the problem arises in what direction he is to be permitted to advance. It must be remembered, too, that one great object of a national education is to give the English workman his proper place in the world, and to enable him to do his work with intelligence and method. This object would be defeated if the best and quickest lads were taught no more when they had just acquired the barest rudiments of knowledge. No one, therefore, who respects the poor and wishes England to remain great would say that poor boys who are above the average ought to be shut out altogether from secondary education. But what may be said is that criticism should be freely applied to the kind of secondary education given to the poor, and that secondary education should be looked on as a whole, and that we should not be content with one little patch of it being given over to Board schools.

THE BISHOP OF PETERBOROUGH ON CHURCH CONGRESSES.

THE Bishop of Peterborough was thoroughly successful as the President of an institution which is now holding its twentieth annual meeting at Leicester, after having passed with all the honours of war through such strongholds of Dissent as Stoke and Swansea. The Bishop took up a bolder position in his opening address at the Leicester Church Congress than his predecessors have been wont to assume. He was not afraid of flouting the usual apology for such gatherings, that they tend to promote reciprocal courtesy and goodwill among the partisans of the various sections into which the Church of England is divided, as being in effect a covert aspersion upon that body for bad manners and deficient charity. In his eyes the Church Congress had imperceptibly and irregularly, but opportunely, grown up as a substitute for some more authoritative and systematic body of lay representation within the Church of England. It was far indeed from a condition of ideal perfection, either in the way in which it came together or in the conditions and restrictions under which it performed its duties; but, for all that, it was a useful and meritorious creation, considering the impossibility which has hitherto existed of framing any more formal machinery for focussing the public opinion of Churchmen.

Intrinsically there was no absolute novelty in this reasoning. Not to go further than ourselves, we have never been afraid of putting forward a similar plea. The importance of the argument consisted in the quarter from which it proceeded, and in its implied reference to actual Church politics. The Bishop of Peterborough recognized alike the existence and the nature of Convocation as a clerical body, and also the desirableness of supplementing this historical institution by some form of lay representation, now that Parliament has so completely let slip the claims which it used plausibly to present of being a lay Synod of the Church of England. It is not so very long since hot-headed ecclesiastical politicians were fond of urging as a desirable reform of Convocation that its constitution should be enlarged so as to comprehend lay members. The answer, however, to this proposal was the obvious suggestion that the change would be not reform, but destruction, inasmuch as Convocation in its constitutional and historical character was "Convocatio Cleri," not more and not less. Still, many considerations of policy concurred in recommending the retention of such a clerical organization (however internally expanded) for functions and objects as to which it was desirable to obtain the united voice of the clergy. The presence alongside of this ancient Convocation of an

elected body of laymen, with whom it would from time to time take united counsel, while not grudging to the lay assembly the fullest powers of separate deliberation, seemed an obvious expedient for reconciling those conflicting requirements which an age of revived ecclesiastical activity had brought into novel prominence. The narrow criticism of timid witlings who made merry over the notion of the laity being left out on the verandah, for a time discredited a project which must, we should think, now that it has been brought into fresh prominence under the powerful patronage of the Bishop of PETERBOROUGH, again assume its position as a legitimately debatable method of Church development. The BISHOP left it doubtful whether the body which he contemplated should or should not contain clerical members, and he hinted at a Parliamentary sanction. This is a proposal on which we cannot look with pleasure, while the existence of a clerical delegation is inconsistent with the simultaneous existence of Convocation.

For our own part we do not advocate a precipitate acceptance of the scheme. Its advantages and its disadvantages cannot be balanced within the narrow limits of an article. But it has clearly come before thinking men in a form which imposes upon them the obligation of giving to it a respectful hearing. The reception which was given to it at a subsequent debate of the Congress showed how it had approved itself to the leading minds of that body. There is one limitation of the active authority of such an assembly as the one proposed by the Bishop of PETERBOROUGH, which ought at once to be fairly and plainly stated, as it will be either a recommendation of the notion or the reverse, according to the opinions and the aims of the critic who grasps the fact. If he is of a cautious temperament it will give him confidence, while the man of daring enterprise will probably fret under the restriction. Convocation, by the confession of its warmest advocates, has, in the present temper of public opinion, to rely mainly upon influence, while it must avoid any semblance of putting forward claims to direct legislative or coercive jurisdiction. It may be urged that Convocation, even if backed by some lay organization, will not be able to do much more; while the collective body of laymen must submit to meet and to debate under similar limitations. The weakness of either body will, in fact, be supplemented by an equally weak partner.

The obvious question will follow, whether it is worth while to create a machine which can, after all, do no more than formulate opinions, and will be impotent to make them effective. The sufficient answer, as it appears to us, to this question will be sought in the counter inquiry, whether, after all, a result which can be defined as the regulation of opinion would be so petty a success in an age when authority confessedly shows many signs of weakening, while opinion dares an unlimited license of universal interference. Besides, an assembly which would only exist for the creation of opinion might come into being without involving any risky resort to Parliamentary initiation. We need hardly insult our readers' understandings by giving them reasons for our aversion at the present moment to engaging Parliament in any such quest as one after a new Church Assembly.

For Convocation itself some such regulated process of attrition between the lay and the clerical types of mind would be very valuable at this crisis in its history, when it has so narrowly escaped a very insidious danger. We refer to the simulated deference to its wishes contained in the Burials Bill as originally brought into Parliament. The so-called Convocation clause, with its fragmentary and dislocated extracts from a very lengthy and complex Convocational scheme, presented about as accurate a quotation from its conclusions as the Puritan preacher did when he overwhelmed the headdresses of his female congregation by propounding "top[k]not "come down" as a text of the Gospel. As the Bishop of PETERBOROUGH himself said of these resolutions in the House of Lords, they "were passed by Convocation for "one purpose, and, as embodied in the clause, were in-"troduced into the Bill for another and different purpose. "They were passed not that they should form part of a "Burials Bill, but to prevent a Burials Bill being carried." However, it suited the Government to take them up, in hopes that the Church of England would be beguiled into fancying itself a party to a fair compromise while suffering a thorough defeat. This device was happily seen through, and Convocation was spared a worse humiliation and risk than that of being ignored—namely, being made use of as a cat's paw. The inference is plain, that if Convocation desires to retain its hold upon the respect of Churchmen, it had better, as things now are, have as little to do with Parliament as possible. But it must have to do with something besides itself, if it means to have a *raison d'être*. That something should most obviously be, in some form or other, a collective and tangible representation of lay opinion within the Church of England.

TRADE PROSPECTS.

THERE exists a good deal of uncertainty in financial and commercial circles in regard to the probable course of trade. During the summer it was very generally assumed that the character of the harvest would at once decide the question. Twelve months ago, it was argued, after the worst harvest perhaps of the present century, there was a totally unexpected and very marked revival. That is to say, the other conditions were so strongly in favour of good trade that even bad crops throughout Europe were not sufficient to neutralize them. Therefore, it was inferred, even an average harvest would give such an impetus to trade as had not been witnessed for a long time. The actual yield of the wheat harvest is still a matter of estimate; but it is known to be considerably in excess of last year; the quality, too, is very much superior, and most of the other crops are unquestionably satisfactory. Yet there are none of the signs which accompany a rapidly expanding trade. Iron, which first felt the revival last autumn, is now much cheaper than it was twelve months ago—is nearly as low in price, indeed, as it was on the eve of the Glasgow Bank failure. Coal, again, is at about the same price as this time last year. And generally it may be said that prices are at a moderate level, and are not advancing. The railway traffic returns, to which so much importance is properly attached as indicating the movement of goods through the country—that is, as showing the number, magnitude, and rapidity of commercial transactions—have of late not been increasing in the ratio that had been expected. More important still is the latest action of the Scotch ironmasters. During the Lanarkshire strike a large number of the furnaces were blown out, and on the termination of the strike it was decided to relight them; but last week this decision was reconsidered, and was rescinded, each master being left to act as he should think best. Lastly, the state of the labour market, which perhaps is the best test of all, is disappointing. The threatened strike at Accrington, on which we commented last week, has been given up, the weavers thus practically admitting the correctness of the employers' allegation that they cannot afford an advance of wages. And in Belfast notice has been given of a reduction of wages. Within certain limits we attach special significance to the state of the labour market. When trade is expanding rapidly, orders pouring in so fast that employers can hardly keep up with them, wages rise automatically. Employers, in their eagerness to take advantage of the smiles of fortune and to consolidate and extend their businesses, bid against one another for skilful workpeople. Even at an earlier stage of an improvement in trade, when masters are not yet extending their operations, but still are doing a steady, profitable business, they will grant a moderate advance rather than drive orders away and possibly jeopardize their future. When, therefore, they prefer a strike to a small advance, and still more when they give notice of reductions at the risk of provoking a strike, we may be sure that the business they are doing is not highly profitable.

Are we to conclude, then, that the revival of last autumn was a mere spurt, and that already the reaction has set in? We think not. The fact must not be lost sight of that the expectations formed during the past twelvemonth were extravagant and impossible of realization. The long depression had made people so weary of stagnation, and so hungry for large gains quickly won, that the instant a revival set in they rushed into gigantic speculations. Iron was in demand for the United States; consequently they bought iron. Many of the speculators had not the means of paying for what they had bought, and very often they sold to persons as impecunious as themselves; but all hoped that the Americans would ultimately take the metal at a greatly enhanced price, and thus that each would draw the stake for which he played.

From iron the speculation extended to other markets, and it ended, as speculations usually do, in a collapse. Those who won and those who lost have alike been hoping for a similar exciting game this autumn, and they are disappointed now that they find the probabilities strongly against their hopes. But in the interest of solid and lasting good trade it is most desirable that there should be no such wild speculative outburst. What is to be wished for is a gradual, steady, prolonged improvement. And that this is in progress we have evidence. It is too soon yet for the altered circumstances of the farmers to make themselves felt. Up to the present time they have been engaged in getting in their crops, in threshing, and other such operations. But they are better able than they were to pay their rents, to employ labour, and to enlarge their expenditure. We do not mean to imply, of course, that a single year has restored prosperity to British agriculture; nor we do forget the lowness of prices. But, compared with twelve months ago, the three classes interested in the land are well off, and this cannot fail to have an increasing influence as months pass on. The country towns will share in the returning prosperity of their rural neighbours, and the manufacturers in turn will be benefited by what benefits the shopkeepers. The cheapness of bread will give a fresh stimulus to improvement. Already, before the harvest is well secured throughout the United Kingdom, the *Gazette* average price of wheat is under 2*l.* a quarter, and it is almost certain that it will fall still lower. Thus the working classes, with more abundant employment than they have had for some years back, will get their bread exceptionally cheap, and consequently will have a larger surplus to spend on other things. This surplus, though small in each individual case, becomes a very large sum when multiplied every week by many millions, and therefore will impart a great stimulus to trade.

Already there is evidence of increased purchasing power on the part of the working classes. The Customs revenue, which had so long been falling off, has of late begun to recover. For the six weeks ending September 18 there is an increase under this head, compared with the corresponding weeks of last year, of 124,000*l.* It is true, indeed, that the present week's return shows a decrease, but that probably is only a casual fluctuation. The increase under Excise proves nothing, as there has been an increase of taxation, and the item of stamps is too heterogeneous to allow us to draw an inference from its augmentation. But the recovery in Customs duties is significant, as it is accompanied by a revival in the tea trade, which a few months ago was in desperate straits. Again, though the Stock Exchange pronounces the railway traffic returns to be disappointing, they show, in fact, a very large increase over last year. From July 1 to September 18 only two out of sixteen principal railways of the United Kingdom show a loss of traffic. These are the Great Northern and the North British; and the latter case is sufficiently explained by the destruction of the Tay Bridge. The Lancashire and Yorkshire has gained 51 per cent.; the Great Western, 66 per cent.; the North-Western, 101 per cent.; and the North-Eastern, 170 per cent. The whole sixteen Companies have gained over half a million. Granting that the corresponding period of last year was very bad, that the increase proceeds with diminishing rather than increasing rapidity, and that in some cases rates have been raised, the fact still remains that a very substantial growth of traffic is exhibited.

Even the iron, cotton, and linen trades—to which we have referred as sustaining the view of those who are doubtful as to the immediate future—are incomparably better off than they were a year ago. The cotton trade was then in a state of collapse; it has since experienced an enormous demand from the East, and at the worst can only not afford higher wages. In the late dispute the employers did not say that they are now carrying on their business at a loss. On the contrary, they held out hopes of an advance by and by. From Belfast the latest news is decidedly more cheerful, and speaks of a largely increased demand; while in Scotland, though a general relighting of furnaces is not ordered, the number of furnaces in blast had risen in the week ending September 18, from 55 to 70, or 27 per cent. In all these facts we have satisfactory evidence that the improvement in trade continues—not so rapidly, indeed, as speculators hoped for, but steadily and gradually, and in the way that holds out the best promise of endurance. The low range of prices proves that speculation is not at work, that the improvement is the result of natural causes, and that the growing demand is not likely to be checked by exorbitant terms. We have already assigned reasons for the expectation that the home consumption will grow during the winter; and if we were to extend our review to foreign countries, we should discover other reasons to support the conclusion at which we have arrived. We will mention but two—the extraordinary and apparently abiding prosperity of the United States, and the assurance which the abundant fall of rain gives us that the Indian crops will again be good this year. In the meantime, however, it is the hand-to-mouth kind of business that grows, and that this is fairly profitable is proved by the cheerfulness that prevails everywhere. It is possible that speculative business, too, may revive when the holiday season is over, for it has been later than usual this year, because of the fine weather and the lateness of the Parliamentary Session. But that will greatly depend on politics.

THE IRISH ANARCHY.

ON Wednesday night Mr. Childers and Mr. Forster, it is said, crossed from Dublin together on the way to meet their colleagues at the Cabinet Council. Any one emulous of the fame of Landor could hardly do better than attempt an imaginary conversation between the two Ministers. Personally that conversation might have a beginning of a rather *aigre-doux* character. For it cannot have been pleasant to Mr. Forster to read how the other day his colleague was good enough to tell the people of Donegal—or was it Galway?—that there were three members of the present Cabinet who had the good of Ireland at heart, and to find that he, the Chief Secretary, was not one of them. Let us, however—or rather let the writer of the imaginary conversation—do these two Ministers the justice to suppose that something else besides personal matters may have occupied their thoughts. Mr. Childers has been making what the organs of the anti-English party themselves call a sort of triumphal progress through the North and West of Ireland. He has been taken to all the show places, has had all the usual pretty compliments paid him, and has expressed himself as delighted with everything. Meanwhile Mr. Forster has been looking, if not with his bodily eyes, on a very different aspect of Irish affairs; he has had—at least for the credit of his office we trust he has had—daily reports before him of murders, outrages, and offences against property. He has had to read how, without the slightest interference from those officers of the law whose action he is supposed to direct, the produce of whole farms has been carried off in broad daylight. He has had to read long lists of those outrages on helpless cattle which not so very long ago aroused an honest indignation in him. He has read of threats and violence of all sorts to persons engaged in lawful discharge of lawful business; and, to crown the whole, he has read of a peer of the realm of Ireland being murdered in cold blood on the Queen's highway. Meanwhile, of less directly painful matter he has had before him reams of reports of speeches at Land League meetings, apologizing for these outrages, and, directly or indirectly, provoking them. He has had time to meditate on the secret of the unwillingness of the Irish members to give him very active help for his unlucky Disturbance Bill; and he has been witness of the first, but certainly not the last, expressions of a dangerous and growing spirit of exasperation among the most loyal and deserving portion of the Irish people. A comparison of notes between two statesmen with such experiences would be not a little instructive, and it ought to have borne some fruit at the Council—that is to say, if Mr. Gladstone could be induced to divert his attention from his beloved friends who mutilate and murder in the East to those who mutilate and murder in the West.

It has very much grieved some sedate English critics that the murder of Lord Mountmorres should have brought about a panic in Ireland, and should be in danger of bringing about something like a panic in England. Nothing can be nobler than the tone in which persons who are themselves in perfect safety implore others who are also in perfect safety not to be panicstricken, and not to be in the least affected by the panic of those at whose foreheads the pistol of the murderer is set. To take an article of one of the Radical organs in England, and to compare it with the actual narrative of the facts of Lord Mountmorres's fate, has a grimness of comedy about it which cannot fail of relish to the discerning palate. The murder itself; the neighbour, his wife, and his daughter refusing shelter to the dying man, either out of brutish superstition, or, much more probably, from sheer fear of the vengeance of the murderers; the bands of the land meeting next day playing dead marches, amid roars of laughter, as they pass the place where their victim lies; the baseless calumnies of lying mob-orators trying to take away the dead man's reputation as their accomplices had taken away his life; the idle perquisitions of the police; the expectation by neighbours of a similar fate—these things make up the picture of the anarchy and terror which are flourishing within half a day's journey of London under the nominal government of an English Minister. The helplessness of the law, if it needed further demonstration, can be demonstrated easily by what has occurred in connexion with the New Ross

murder—that murder which, according to Mr. Parnell, would have been quite unnecessary but for the culpable omission of the farmers in the neighbourhood to organize. Here pressure has been put on the Government to give up witnesses whose evidence may be, and probably is, material to a conviction, to be tampered with by their friends, and the pressure has in part succeeded. The rewards offered for other evidence are denounced openly by the agitators, and the shouts of "Give him lead!" which have before and since had such fatal translation into acts, are passed over by them without notice or expostulation. Meanwhile, on this side of the water, advisers of the public gravely request that Englishmen will not on any account go into a panic, and that they will pay no attention whatever of an extraordinary kind to the murder of Lord Mountmorres. Indeed we may expect to hear at any moment that, if anybody pay such attention, he is only a snob who "loves a lord."

What is more particularly interesting is to contrast with all this the shouts of execration which have arisen from these same persons at the words of the bellicose Orange parson who took it into his head the other day to suggest that there were games at which two could play. We are certainly not inclined to make ourselves Mr. Kane's apologists, and it is to be feared that the reverend gentleman has studied the Pentateuch a good deal more than the Gospels. But it is to be observed that all he advocated was in the way of self-defence and retaliation, not the beginning of hostilities. It will be very hard for any of those who execrate Mr. Kane and deprecate panic in reference to Lord Mountmorres's murderers to make out that, even in a civilized country, the apathy of a Government in enforcing the law may not at some point or other justify the resumption by the individual of the right to protect himself and to strike at his enemies. It is for the Government to show that this lamentable condition of things can in no case arrive in Ireland, that they are aware of the dangers of the case, and willing and able to meet them. The complete impunity with which the operations of the Land League (which it is idle to endeavour to separate from the murders now committed monthly) continue to be carried on must necessarily have encouraged evildoers. There seems to have been a singular misapprehension, if it be no worse, of the facts of the case on the part of some English critics. Strong indifference to verbal provocation is one thing, weak indifference is another. A Government can afford to laugh at Mr. Parnell and his rabble so long, and so long only, as it keeps constantly in evidence force which is ready at a moment's notice to scatter the said rabble into its constituent elements of individual rascality. When it does not do this the rabble becomes something like a military demonstration, and impresses friends and foes accordingly. Moreover, every one in his senses and with the slightest knowledge of Irish history knows that, in the ordinary course of law, agrarian and political crime is hardly ever detected in Ireland. Evidence must be obtained by unusual inducements if it is to be obtained at all. Now those who could give evidence will never be induced to do so unless they are certain of the strength of the Government on whose side they, at considerable risk, throw themselves. The most red-hot partisan cannot deny that the spectacle of the reaping of the "Land League farms," and many other such things, are calculated to excite in the minds of timid people, who could come to the assistance of the Government with useful information, anything but confidence in its strength and determination to bear them harmless.

In the face of such a ghastly event as that at Clonbur, one has little heart to take note of the merely ludicrous aspect of the agitation. Gifted poetesses who describe with fervid eloquence how the angels look down with approval on poor men holding their own, how the saints bless their cattle, and make their crops yield a thousandfold, while they entirely forget to tell us what attitude the saints and angels assume towards the same poor men when they cut off the tails of their landlord's cattle or steal the crop that is legally his, might give plenty of scope for comment at another time. Mr. Redpath's eccentricities are not easily exhaustible; but, when one remembers that the orator amused himself by denouncing one murdered landlord close to the very spot where another had been murdered the night before, he too ceases to be a subject for raillery. The well-known flowers of Irish newspaper rhetoric have not failed to be lavished on the demand that districts which have forfeited the right to be treated as the abodes of civilized freemen should be subjected to some more appropriate regimen. The suggestion, which seems very likely to be a fact, that the weapons with which Lord Mountmorres was slaughtered may have been purchased with the money which amiable Englishmen subscribed last winter for keeping the interesting people of Ireland alive, crowns the irony of the whole business appropriately enough. But the business itself has gone beyond a joke. Parliament is not sitting; the chief attention of Ministers seems to be devoted to plans for bringing Europe by the ears; the Congregational Associations and the Unions of Liberal Young Christian Men are still occupied in contemplating ecstatically the mercies of the late general election; and certain newspapers, which used to discover that Lord Beaconsfield's policy was, with unavoidable drawbacks, the best of all possible policies, have succeeded in getting themselves into the same mental attitude with regard to the policy of Mr. Gladstone. Meanwhile, the remark as to Ireland and civil war seems to be realizing itself in the manner in which such remarks have a habit of realizing themselves. After recent events, it will not be in the least surprising if the Landlords' Defence Associations, of which something was heard some time ago, should become accomplished facts; and then, it need hardly be said, a struggle will have been begun of which no man can see the end. It is certain that in every imperfectly civilized country the mass of the people incline to that side which shows most overt strength, and it is equally certain that a strong spirit of factiousness still exists in Ireland—of factiousness, if the word may be used, on the right side as well as on the wrong. An open war of secret Societies (the contradiction is allowable enough) would probably confirm Mr. Kane's anticipations to the letter, and would exhibit to Europe a spectacle the scandal of which would perhaps be hardly greater in kind, but certainly greater in degree, than the scandal which has just sent a cool-headed French observer away from the shores of the isle which used to be the special pet and *protégé* of France, convinced that Irish prospects are pretty nearly hopeless. Only the most energetic action can cure the evil, and it seems very improbable that any energetic action will be taken by the present Ministry, unless it be action altogether the wrong way. We began this article by suggesting an imaginary conversation of the living; we may end it with the suggestion of an imaginary conversation of the dead. The ghosts of Sergeant Brett and of Lord Mountmorres might have something to say to one another, and it would be interesting to hear the opinion of both as to the present Prime Minister of England.

OAKHAM AND UPPINGHAM.

THE existence of Rutland in the very heart of England, as an independent county unknown to Domesday, is pronounced by Mr. Freeman to be "an insoluble problem." We certainly can discover no historic trace of a tribe of *Rotlandas* making this circumscribed district their home, as the *Sumorsætas* and *Dorsætas* did the shires which perpetuate their names in the South-west. The little county, which oddly enough appears as an appendage to Nottinghamshire, from which it is separated by a wide stretch of Leicestershire, a century before it emerges as a distinct shire, may possibly have taken its name from the colour of its ferruginous soil—"Rutland" quasi "red-land." The proverbial saying, "Rutland raddleman," preserved by Fuller, connecting the county with the "raddle," or "ruddle," used for marking sheep, may here be quoted; and, though the matter is far from certain, this is perhaps the most probable derivation of the name. But, though we have little ground for claiming a similar origin for the counties of Somerset and of Rutland, they present some curious and not unsuggestive points of correspondence. Rutland alone of Mercian shires—Shropshire, with its shiretown of "Scrobbesbyrig," now softened into Shrewsbury, is of course no real exception—has a distinct name of its own, like Somerset, entirely unconnected with its capital. If it is a modern blunder, the fruit of that unreasoning craving for uniformity which is gradually rubbing out all old historic landmarks, to speak of Somerset*shire*, Rutland*shire* is as much a misnomer, as unknown on the spot, as Cumberland*shire* or Westmoreland*shire* is anywhere. Girt in on all sides by large counties taking their names from the chief towns round which they were grouped as a convenient centre—Leicestershire, Northamptonshire, Lincolnshire, and the rest—Rutland in its minuteness is above them all in the perfect independence of its being. Oakham is the chief town of Rutland; but in no sense is the county of Rutland an appendage to Oakham.

We have spoken of Oakham as the chief town of Rutland; but in this also there is a point of correspondence between Rutland and Somerset, that it contains more than one town of so nearly the same size and importance that it is not easy to say to which the precedence rightly belongs. But while the dignity of shiretown has been parcelled out among several towns in Somerset—the assizes being held alternately at Wells and Taunton, and Ilchester till recently containing the county gaol, and, going a little further back, being the one place for the election of the knights of the shire—Oakham has always been the assize town and the centre of county business. The one privilege reserved to Uppingham appears in an ordinance of Henry VII. that the standard for weights and measures should be kept in it. At the present day it is not easy to say which is the less important place. Neither Oakham nor Uppingham is in size or appearance much beyond a large village. The population of neither exceeds three thousand. In Oakham, as befits the capital of the smallest county in England, with the exception of the church and Castle Hall, all is diminutive. The houses that line the long street which, with a little market square, make the town are generally small and low. Few aspire to three stories. Some are mere thatched cottages. There are a few examples of the stone-mullioned window and the gabled oriel characteristic of the district, but the aspect of Oakham is old-fashioned rather than old—neat and decent, but hardly picturesque. The little grass-grown market-place is more attractive. The octagonal "Butter Cross," a wooden structure covered with a lofty pyramidal roof raised on sturdy posts and sheltering the once formidable town stocks, with the long, low, grey-roofed, timber-framed shambles as a background, offers a charming subject for the sketch-book. But the chief objects of interest in Oakham, which of themselves will reward a journey thither, are the very noble Church, the Castle Hall, and Flores House, the last two ranking among the most important remains of Domestic architecture in England. The Flores or Flowers were the leading family at Oak-

ham for several centuries, their name constantly appearing in the records of the town and its charitable foundations, and to one of them the erection of the beautiful fourteenth-century spire of the church is attributed. The mansion known as "Flores House," the picturesque ivy-mantled front of which is one of the chief ornaments of the main street, preserves, amid much alteration, several Early English features. The house, which is of some considerable size, consisted of a hall in the centre flanked by gabled wings projecting backwards. This considerable mansion guards the southern entrance of the town, which was never walled, the street here being narrowed to the width of one vehicle. Here, as elsewhere, it is observable how in mediæval towns the wider spaces and thoroughfares of the interior were only approachable by entries of very contracted dimensions, admitting of easy defence against those whom it was undesirable to admit any further. The principal entrance of the house is a very good example of a shafted doorway of the thirteenth century, one of the dripstone terminations being a crowned head with the short beard and hair of Henry III. Within, on the end wall of the hall, between the screen and the entrance to the kitchen, is a curious early water-drain, resembling a *piscina*, for washing the hands before and after dinner: an arrangement of which later examples are found at South Wingfield in Derbyshire, Dacre Castle, and the Deanery, Wells. The orifice of the drain is protected by a human head, and the shelf is carved with a rose and large single dog's-tooth ornaments; above is a staple for the towel.

From Flores House it is but a stone's-throw to the Castle, the hall of which may be safely pronounced, both from its early date (the latter part of the twelfth century) and from the beauty of the design and the excellence of its ornamental features, as well as from its happily unaltered state, to be without a rival as an example of our domestic architecture. Of the defensive works of the Castle little remains. Earthworks of Anglo-Saxon or perhaps earlier date defended by a fosse support some ruined ivied walls, destitute of architectural character, and enclose an irregular area. This has been divided into an outer and inner court separated by a ditch, and perhaps a stockade. At present there is no trace of a wall. The south-east corner rises into a low mound as if for a keep-tower, the external face gay with brilliant flower-beds. But the whole has been so dismantled that it is almost impossible to make out the original plan. The hall stands detached towards the south of the area. Like the Royal hall at Winchester and the Episcopal hall at Lincoln, and the still earlier example of Westminster Hall as originally built by Rufus, the hall of Oakham Castle is divided into a centre and side aisles by two rows of pillars and arches. The pillars are cylindrical, with highly enriched Corinthianesque capitals, which at once recall the contemporary capitals at Canterbury and Christchurch, Oxford, though with a decidedly foreign feeling in the foliage, which renders them more akin to those at Soissons and Blois. The arches are semicircular, and are richly moulded. The plan of the windows, which are happily unaltered throughout, shows externally a pair of lancets, divided by a shafted mullion, with double bands of toothed ornament running up the jambs. The window openings are square headed, the heads of the lancets being left solid and usually richly carved with foliage. Within, the rear-arch is round-headed with bold tooth adornment in the hollow chamfer. There is no clerestory. The quaint beasts—cat-a-mountains, bulls, lions—from which the terminal arches spring as corbels, themselves supported on regal and other heads, the musicians perched on the abacuses of the capitals, the centaur and mounted lion which stare down from the summits of the gables, and other bits of carving about the building, are full of original power which is more attractive than many a more finished work. The great charm of the building, however, is its unaltered condition. Since George Villiers, Duke of Buckingham, put up the high-pitched roof, it has remained substantially untouched by the hand of modernizer, or, more dangerous still, restorer. With the exception of the very unobtrusive fittings introduced to adapt it to its purpose as Assize Courts—the bench, the bar, the witness-box, the dock, and the rest—the hall remains substantially the same as when first erected by Walkelin de Ferrars just at the time that Henry II. was first sending out his justices *in eyre*, and mapping out England into judicial circuits roughly corresponding with those of the present day. Next to the singular beauty of the architecture, the horse-shoes which crowd the walls—the tribute of many regal as well as noble visitors, from Queen Elizabeth down to her present Majesty when Princess Victoria, and the Princess of Teck—attract the visitor's attention. There are horse-shoes of every size from the huge Brobdingnagian gilt rings six feet across, which hang over the judge's seat, to the little shoes of as many inches over the side doors, and of various materials, from that of George IV., when Prince Regent, of polished brass, to the humble matter-of-fact rusty iron shoes actually taken from a horse's foot. This curious "custom of the manor" which authorizes the claim from every peer of Parliament the first time he passes through the town of a horse-shoe to be nailed to the castle gate, though entirely without documentary authority, is of high antiquity; but the date of its institution and its original meaning are completely lost. We can hardly doubt, however, that there is some connexion between this toll of horse-shoes and the family name of Ferrers, *de Ferrariis*, who bear a "canting coat," as the heralds say, "semée of horse-shoes."

To the west of the castle stands the church. Both in outline and in detail this is a singularly beautiful building, and the restoration, which was conducted by Sir G. G. Scott in 1858, while productive of much good in clearing away pews and galleries and allowing the fine proportions of the interior to be fully seen, appears to have done no more harm than is inseparable from the work of the restorer. The western tower, a spire of Late Decorated date, is a very stately composition, assigned, as we have said, to one of the Flores as founder. The relative proportions of the successive stages are excellent; it is not overdone with ornament; the tall coupled belfry windows give immense dignity to the tower, while the junction of the spire—generally an awkward thing to manage satisfactorily—is admirably masked by the corner turrets of unusual size which take the place of pinnacles. The general effect of the exterior is of a building of the Perpendicular date; but, as so often happens, on entering we find that later walls and windows mask an earlier fabric. The nave arcade is Early Decorated *circa* 1320, the capitals being much enriched by carvings of angels, animals, foliage, &c. The chancel is also a Decorated work to which very wide chantry aisles have been added of late Perpendicular reaching quite to the east end. There are quasi-transepts formed by doubling the two eastern bays of the aisles, under a flattish gable. This arrangement as seen without is not pleasing. The general effect of the interior is one of singular stateliness and spaciousness. The architecture and fittings, including those put up in the late restoration, are all of unusual excellence, and the building is evidently well cared for and used. We must not omit to mention the grand old tub-shaped Norman font, elevated on a high panelled base of later date.

At the north-east corner of the churchyard a long high-pitched gabled building of Charles I.'s time shelters the celebrated Grammar School founded, together with the sister establishment at Uppingham, in the reign of Elizabeth, c. 1584, by Archdeacon Robert Johnson, Rector of North Luffenham, Prebendary of Windsor and Rochester, and Archdeacon of Leicester. The founder of these two educational institutions, by which the names of the little towns of Oakham and Uppingham have become known far beyond the limits of the county and its vicinity, was the son of Maurice Johnson of Stamford, M.P. for that borough. He served as chaplain to the Lord Keeper Nicholas Bacon, and was vicar of Luffenham for half a century, "preaching painfully and keeping good hospitality," and died there, at the advanced age of eighty-five, in 1625, in which year the statutes of his two schools were first promulgated. His grandson Isaac Johnson, with his wife, Lady Arabella Fiennes, left England in 1630 with the "Pilgrim Fathers," and died at Boston the same year, appointing John Hampden his executor. The Lady Arabella did not survive many months. The code provides for a master and an usher—now swelled to a staff of nine-and-twenty masters and teachers of various subjects—of whom the former was to be "painful in the education of children, of good learning and religion, such as can make Greek and Latin verse"; while the usher was to be "a godly, learned, and discreet man, that can make him Latin, both in prose and verse." The poor boys had no indulgent allowance of holidays. The now time-honoured "Midsummer holidays" had not come into being, while the Christmas holidays were limited to a month, from "December the tenth to the Monday after Twelfth Day"; and the only other relaxations from continuous study recognized by the statutes were ten days at Easter and Whitsuntide. After a useful existence of two centuries and a half, with varying fortunes, but on the whole doing good educational work, as proved by a long list of distinguished alumni, including two living members of the Episcopal Bench, Archdeacon Johnson's foundations have come under the Charity Commissioners, who have decided that, Rutland being too small a county to be allowed to retain two first-grade schools, the higher dignity should be reserved for Uppingham, Oakham being bidden to "take a lower room." The decision was probably not an unwise one. Experience had proved that the prosperity of the two schools was never contemporaneous; that if Oakham was up, Uppingham was down. There was certainly room for a good second-grade school. The change has been more nominal than real; and after an interval during which the institution was recovering itself from the shock, Oakham Grammar School, under an able and energetic head-master, is once more prosperous.

Oakham lies relatively low, among the green pastures of the fertile valley of Catmose, whose praises are sung by Drayton:—

> Bring forth that British vale, and be it ne'er so rare
> But Catmus with that vale for richness may compare;

looked down upon to the east by the umbrageous woods and vast white stone mansion of Burley-on-the-Hill, rich in memories of James I. and "Baby Charles" and "Steenie," of Ben Jonson's masque of the "Gipsies" acted, and Bishop Andrewes's learned discourses preached before the Court here—taken by storm by Cromwell himself in July, 1643, and occupied by a Parliamentary garrison, by which it was afterwards deserted and burnt, but rebuilt after its purchase by Daniel Finch, Earl of Nottingham, in a style more ponderous than beautiful. Uppingham, the other recipient of Archdeacon Johnson's bounty, on the contrary, stands high; its long sinuous street (Leland, when he visited it three centuries and a half ago, wrote, "It is but one meane streete") stretching along the very edge of one of the long, low steep hills which are the characteristics of this part of Rutland, making it like a magnified ploughed field all "ridge and furrow." Uppingham has no such examples of mediæval domestic architecture to show as those which are the glory of Oakham; but it has some good stone-fronted houses, both in the earlier mullioned and gabled style and in that of the first Georges, with tall sash windows, projecting cornices, and well-proportioned dormers. These are now thrown into insignificance by the tall

new hotel, and the various masters' boarding-houses, with their long ranges of dormitories and studies, some of which, but chiefly those outside the town, are really palatial structures. Every here and there a gap in the houses affords a peep of tempting shady gardens and old-fashioned mansions, retiring in dignified state from the noise and turmoil of the public street. In days of unscientific etymology Uppingham was supposed to have taken its name from its elevated position. Of course it really denotes, as Kemble pointed out long since, the "mark" or home of the Upingas. The place has given birth to a proverb, "As round as an Uppingham trencher"; but, beyond its having been the first incumbency of Jeremy Taylor, and having sheltered Charles I. on his flight from Oxford to Southwell, with Ashburnham and Hudson, on the night of Saturday, May 2nd, 1646, its annals are bare of historical incidents. The church, which stands conspicuously on the very brow of the steep descent, at one end of the market-place, though much inferior to Oakham, is far from deserving Leland's contemptuous description as "a very meane churche." It is a large building of Decorated date, with a well-proportioned western tower and spire, which, from its position on the summit of the ridge, is a conspicuous object from all the country round. The interior was restored too soon, and preserves little that is ancient except the very pleasing nave arcades, which on the south side retain some of their decorative painting; the freedom and grace of the scrollwork, and the irregular spacing of the red stars which powder the soffetes, are a marked contrast to the lifeless exactness of modern stencilling. The chancel is entirely modern, with slender serpentine columns and natural leafage on the capitals; well intentioned and costly, but certainly un-English and very far from pleasing. The chief object of interest in the church is the old Jacobean pulpit, from which Jeremy Taylor preached during the four years that he resided as rector of Uppingham. Restorers have done all they can to spoil this invaluable relic, by robbing it of its sounding-board, lowering it and putting it on a leg of polished serpentine quite out of keeping with its arabesque oak wainscot sides; but the body of the pulpit is as it was in Taylor's days, and is shown to the curious visitor by the sexton as "Gen'ral Taylor's pulpit; or Gen'l'man Taylor's, I don't mind which; anyhow, he lived a long while ago." The parish registers exhibit delightful examples of Taylor's neat calligraphy, in marked contrast with the ungainly ill-spelt scrawl which deforms the pages after he had left Uppingham by the King's command in 1642 to join him as his chaplain at Oxford. Taylor became rector of Uppingham, March 23, 1638, on the presentation of Juxon, then Bishop of London. The first entry is his signature at the bottom of the page for that same year, "Jeremy Taylor, Rector Ecclesiæ." The next year we have the entry of his marriage, "1639 Mr. Jeremiah Taylor ('Rector' interlined) and Phœbe Landisdale, married May 27." We know nothing of Mrs. Taylor's family beyond the fact that her brother was a physician living in his "apothecary's house" at Gainsborough in 1643, and afterwards established at Leeds. Her mother seems to have been a widow residing temporarily at Uppingham, but afterwards living in London, where, after his wife's early death and the sequestration of his living, we find Taylor and his two little boys domiciled with his mother-in-law, and harassed with the pecuniary difficulties which during the greater part of his life continued to pursue him. The baptismal register is imperfect from 1633 to 1643; so we have no entry of the baptism of the three boys born to him at Uppingham. The register of funerals records, in his own neat hand, the burial, on May 28, 1642, of "William (named, Heber thinks with great probability, after his great patron Laud), the son of Jer. Taylor, and Phœbe his wife." The mother did not long survive her child; but the place and date of her death are unknown. Taylor's modest parsonage to the west of the church, though largely added to to suit the requirements of modern rectors, remains substantially unaltered. It has a stone front, with projecting two-storied oriels capped with gables, after the type of the district, of which examples are so abundant at Stamford.

The most marked feature in Uppingham, however, is the group of school buildings erected from the designs of Mr. Street to the south of the main thoroughfare. These, which form two sides of a proposed quadrangle, to be built as the property falls into the Governors' hands, comprise a chapel and a school-room, standing on an open cloister, and class-rooms below, we were going to say at right angles to one another. But oddly enough the two blocks of buildings do not run square, and though the divergence is masked by a cylindrical bell-turret in the corner—not a very happy effort of Mr. Street's genius, rather too much resembling a Mordan's pencil-case, and too small to allow the fine bells to be rung—the effect is displeasing, and will be more so when the other sides of the court are built. The whole group is in the form of earlier Gothic, chiefly affected by Mr. Street, but with all its excellences of proportion and detail there is an unsympathetic hardness about the design which fails to charm. The interior of the chapel, with window tracery reminding one of Merton Chapel, is very striking from its height, and the distance of the window-sills from the floor. Mr. Street knows the value of blank walls. The original school-room, of the same humble type as that of Oakham, still stands at the south-east corner of the churchyard, but is reduced to a carpenter's shop—carpentry and joiner's work having been judiciously added by Mr. Thring, the present Head-Master, to his school curriculum. At the opposite end of the churchyard, to the west, are the other buildings, forming "School-house Quad," partly old, partly new. The former, a low ivy-vested gabled group, comprises master's house, dining hall, and dormitory over, tossed together with little order, but with the happiest result as regards picturesque effect. Two sides of the school court are surrounded with a low range of tiny studies, measuring about 6 ft. by 4; each with its table and chair, book-shelves, and ink-stand, recalling the "carols" of a monastic cloister, warmed with hot-water pipes, the walls hung with pictures and decorated with brackets and statuettes, or austere and bare, according to the means and taste of its juvenile occupant. By this wholesome arrangement, which is carried out in all the separate boarding-houses, each boy has conferred on him what Aristotle calls the "unspeakable" delight of the "sense of private property." Few things give a higher idea of the healthy spirit pervading the school, and of the educational work done in it, than a visit to these studies. Many a man will think with a shudder of his own schoolboy days—three hundred boys in one big schoolroom, without book-shelves, desks, or anything to write on save on one's knees, a scene of noise, idleness, and brutality. Each boy has his separate cubicle, and the school classes never exceeding thirty boys on an average, and the boarding-houses being limited to the same number, every boy feels that he is known and cared for individually. Mr. Thring's eulogium may be summed up in the simple fact that the seven-and-twenty years of his head-mastership have resulted in the numbers of the school being raised from twenty-five boys—a certain number having followed the former Head-Master to Durham—to an average of three hundred and twenty, and that Uppingham may now take rank among the leading public schools of the country. The school lists of Uppingham are not barren in distinguished names. To omit living scholars at both Universities, its rolls show the names of Ferne, Bishop of Chester; Stanhope, Dean of Canterbury; and Manners Sutton, Archbishop of Canterbury.

Any account of Uppingham School, however slight, would be incomplete without reference to that remarkable epoch in the school annals known as the "Exodus to Borth," when the whole three hundred boys, driven out of their old quarters in January 1876 by typhoid fever—the fruit here as elsewhere of inadequate drainage—found refuge on the shores of Cardigan Bay, where for twelve months, under strangely new surroundings, partly in the huge empty hotel, partly in extemporized wooden sheds, partly in cottages of the village of Borth, the school work was carried on almost as efficiently as in Rutland. Never was a terrible evil, threatening the very existence of the school, met with greater tact and courage, and not only averted, but transformed almost into a good by practical wisdom and unwavering faith. The whole story has been so charmingly told by Mr. Skrine, in his *Uppingham by the Sea*, that we cannot do better than close our article by recommending our readers to get a sight of his delightful little volume. When once begun they will find it difficult to lay it down.

BROAD CHURCH ETHICS.

DURING the last week or two some of the most prominent members of what calls itself the Liberal party in the Church of England have been taking to themselves a considerable space in the daily newspapers. Some ten days ago the matter began by the publication, or rather the republication from a provincial journal, of a scheme of home reunion from the pen of the Dean of Westminster. Then Mr. Stopford Brooke announced his reasons for seceding from the Church, and Mr. Brooke's reasons have brought down remonstrances upon his head from Mr. Capes and Mr. Haweis. With Mr. Stopford Brooke we have nothing to do at present. His conduct, whatever may be thought of it from other points of view, at least presents no hold to adverse criticism from the ethical side. He has not, strictly speaking, held any preferment in the Church, and therefore is not called upon to resign any, and he has honestly enough announced his secession. It may seem odd that he should prefer Brookism—for that is the sect to which, as we gather, he has now definitely joined himself—to the Church of Augustine and Anselm, of Wilson and Butler; but that is a matter for himself only. The other persons we have mentioned are not in a similar position, and the manifestoes which they have published are much more curious documents. The Dean of Westminster's is perhaps the least remarkable, because he tells nobody anything that he did not know before. But, considering its priority in point of time and the rank of the writer, it probably deserves to be dealt with first. Dean Stanley's ideas and practical discharge of his duty as guardian of the Abbey of Westminster are already sufficiently historical. It seems to the Dean that the best thing he can do is to open that building to all the sects which are most hostile to the Church to which it belongs, and which make no secret of their hostility. To do the sects justice, they have been very little moved by the advantages accruing to them from the legal accident that Dean Stanley is his own Ordinary. The Dean with some naïveté confesses this; but still he suggests that the experiment should be tried elsewhere. Putting decency and some other things for the moment out of the question, there is something very engaging in the simplicity of the means which the Dean wishes to employ. A good-sized minster, with a Church service going on in the choir (if that does not savour too much of ascendency), a Roman Catholic divine officiating in the Lady Chapel, a Ranter in the

nave, a Baptist in the south transept, and possibly a Quakers' meeting in the Chapter-house—given these simple conditions, the dissensions of English Christendom will, thinks the Dean, shortly be healed. If anything more remains to be done, he proceeds to point out how to do it. Even at present, thinks Dr. Stanley, there are no subscriptions or declarations, or anything else of the kind, which need keep anybody out of the Church. A dozen years ago all these things were commuted into a "simple assent to the doctrine of the Church of England as contained in the Book of Common Prayer and the Articles." The Dean is very particular about "doctrine," in the singular. For it seems that you may assent to the "doctrine" of the formularies without assenting to their "doctrines." This invaluable singular allows anybody to make a mental reservation of any particular doctrine he does not like as not being included in the general doctrine. It is clear, therefore, that anybody who will not come into the Church is an idle hair-splitter. The "slight and colourless adhesion" might indeed be done away with, and it would be a very good thing to do away with it, but it really does not matter. Still Dr. Stanley thinks that it would be a capital thing if "the narrower system" were left to "Nonconforming Churches": that is to say, he proposes, with a legerdemain surpassing Mr. Maskelyne's, to make conformity into nonconformity. So far the Dean; and it is to be observed that he is addressing himself to those who are outside the Church and advising them to come in. His argument of course cuts both ways, and in the cutting exposes some very singular conformation of moral fibre in himself and those who sympathize with him. But the exposure is indirect only.

It is otherwise with the other letters to which we have referred. Mr. Haweis is extremely angry with Mr. Stopford Brooke, whose conduct he declares to be an anachronism. We forget who it was that long ago declared this particular word to be the best he knew for a speaker or writer who wished to express disapprobation without giving his reasons for it. Mr. Haweis, however, is wasteful, for he not only employs the saving term, but gives his reasons likewise. These reasons are rather long, but practically come to this. The Liberal clergy are very valuable to the Church, therefore they ought not to leave her. Also there is no reason why they should leave her, unless they have committed technical offences, for which "the Administration" can turn them out. Mr. Haweis is quite lavish in the expression of his opinion that, if this is the case, they ought to go. If you are expelled, go by all means, he says—which seems a piece of advice verging on the superfluous; but, if you are not expelled, by all means stick. Mr. Capes had previously taken up the same attitude in a more dispassionate and critical manner—indeed, in a manner so gratuitously dispassionate that it looks terribly like irony. He informs his readers that "a large number of the Liberal clergy disbelieve in the miraculous" altogether, but, being men of "robust and simple minds," they reflect that all they have got to do is not "in so many words to attack the Thirty-nine Articles." Therefore they robustly and simply hold their "curacies, livings, and positions as members of our Cathedral establishments"; nor, according to Mr. Capes's views of casuistry, are they to be blamed. We do not know how far the robust holders of this convenient view would accept Mr. Capes's spokesmanship, but we have not yet seen any disclaimer; and Mr. Haweis's letter looks, on the contrary, much more like an endorsement. So that, on the whole, it would appear that poor Mr. Stopford Brooke has exposed himself to the arrows of both sides. Orthodoxy, while exonerating his morals, cannot but regard him as something of an apostate; latitudinarianism looks at him with disgust, as at a feeble brother much lacking in simplicity, who has not the wit to save his temporalities (if he had any) with a robust *distinguo*.

It cannot be denied that these documents, taken together and studied with attention, are in the highest degree instructive, though the word "instructive" cannot be here regarded as a synonym for its congener, "edifying." "I," says the Dean of Westminster, with simplicity certainly, if not with robustness, "am, by a pure antiquarian accident, exempted from supervision in my management of the building committed to my charge. I have availed myself of this accident to give a grave scandal to most of the earnest members of my own communion, in pursuance of a private fad of my own. This fad, however, is, I must tell you, connected with a larger question. The persons I have admitted of grace to Westminster Abbey might just as well come of right. There really is nothing to prevent them. They have only got to declare quite colourlessly their general assent to a doctrine made up of an infinity of other doctrines, which they are quite at liberty to pick and choose. It is true that their fathers, and, indirectly, they themselves, objected to these very doctrines, not one of which was more in the Prayer-book then than it is now; but that does not matter." Then Mr. Capes takes up the ball, and proceeds to show that not merely a very qualified assent to the doctrines of the Prayer-book, but a disbelief in the miraculous altogether, is quite compatible with the holding of the Church's functions, the wearing of her livery, the pocketing of her stipends. And, finally, Mr. Haweis rounds off the matter by pointing out that the clergy not only may so hold on, but that it is their duty to hold on, because of their extreme intrinsic value to the Church itself. It has not been thought of late years that a clergyman held, as a rule, a position of ideal comfort and happiness; but Mr. Haweis's contention restores him to all, and more than all, than was ever supposed to be his. His duty, his vanity, and his interest, all converge and unite in one sweet compulsion to make him "hold his own," as Miss Frances Parnell would say. Far be it from him to be so anachronistic as to feel repugnance at taking money in virtue of an adhesion which he has practically recanted, at pronouncing with an air of solemnity words which are to him but vain breath, at wearing the uniform of an institution which he is doing what in him lies to subvert and destroy. It is his duty not to take his valuable services away, and the conviction that they are valuable is sure to strengthen him as much as the sight of his banker's book in the perception of that duty. So, no doubt, Marlborough and Godolphin, when they served William in name and James in fact, felt comfortably convinced that the value of their services to England was such that it would be culpable to deprive her of them by a retirement to St. Germains. Only when they are expelled—that is, we suppose, when they are deprived of their temporalities, for we do not quite know what else expulsion means—then Mr. Haweis is clear that they should go. Their services being declined, and the consideration for those services brutally withheld, there is clearly nothing else for them to do. Indeed the argument of all these good persons holds together with a delightful consistency. Logically there is literally nothing to be said against them. Ethically there is no doubt a good deal. But ethics is, on the whole, rather an effete science, and perhaps they do well to disregard it. Nevertheless, some faint satisfaction may be permitted to minds neither simple nor robust in feeling that a standard of less robustness and simplicity obtains in the ordinary dealings of life.

CHEAP-TRIPPERS.

ANY person who may have been moved by the crowded state of seaside places in the South, and by terror of cockney excursionists, to spend his holiday in one of the Northern counties, will have reaped small advantage from the change of latitude. It is true that the race of 'Arry is not so widely known in the North as in the South; but the mining and manufacturing districts of Lancashire and Yorkshire provide a corresponding plague which, if less offensive as regards the individuals composing it, is rendered even more terrible by force of numbers. Railway officials, and after them the general public, have given to these hordes the name of "cheap-trippers." Descended from the barbarians who were the terror of civilized nations in centuries gone by, they have kept to some extent the nomadic instincts of their fathers, and emerge at intervals from the smoke and dust of their mines and factories to rub elbows with those who enjoy a purer air and less circumscribed range of vision. An inexperienced visitor to a North-country watering-place may go down to the sea for his early morning swim, rejoicing in the quiet of the place, and looking forward to a peaceful day in the open air. But the Gaul is at the gates. As he returns from the shore, and looks towards the railway-station, he sees the streets black with a crowd that grows and spreads till it covers the land as completely as a swarm of locusts in South Africa. On inquiring from a native what it all means, he is told that "a trip is in" from some large manufacturing town, and his peace is gone, for that day at least.

It is not only those places known as health resorts which the cheap-tripper delights to visit. Sometimes a large mining district is deserted for a day while its inhabitants go to swell the population of a crowded city. A business man as he walks the streets finds his path blocked by a crowd of gaping women who chatter in an almost unknown tongue, and are far too bewildered to get out of the way. Next he perhaps encounters a gang of colliers, who half poison him with the smell of rank tobacco, and hoot at him because he wears a high hat. It is curious that the two sexes are rarely seen together from the time when they leave the train until the hour of departure. The men parade the town in close order, followed at a respectful distance by a train of women and children, as the custom is with primitive man. They hustle every one off the pavement, and when in a good temper treat the police with utter indifference. The dignity of the Church receives from them no more consideration than the majesty of the law. A closely-shaven curate, who was walking down a street clad in his cassock, was once horrified by hearing shouted across the road the inquiry whether "yonder was a lad or a lass."

Next to publicans, the proprietors of china shops seem to profit most by these excursionists. Every woman thinks it necessary to take home with her a small white mug with a suitable inscription, or a plate stamped with a view of the town she has visited. There is a large demand, too, for balloons; and the extent of the family may often be approximately ascertained by the number of these trophies which a fond mother carries with her to the station. The tendency of the men to limit their expenditure to the purchase of refreshment is almost universal; and we are disposed to regard as a model of conjugal devotion a collier who once waylaid a lady as she was leaving her milliner's, attracted her attention by a nudge of the elbow, and, pointing to a jacket in the window, asked whether she thought it would cost more than thirty shillings. He was referred to the milliner; and, on meeting the same lady afterwards in the street, he greeted her with that peculiar sidelong jerk of the head which is the recognized method of saluting an acquaintance in the North, and said in a solemn tone, "It were fifty."

His annual visit to the seaside is to the collier something more

than a mere holiday. It is the occasion of a solemn ceremony. On this day alone in the whole year he is completely washed. As a rule, he regards total submersion as not merely unnecessary, but absolutely harmful; and, after a day's work in the pit, he never washes below the waist. It is an article of belief among colliers that anything more than this diminishes their strength, and we have heard an ex-collier justify the prejudice on what he called the scientific ground that excessive washing removed the natural oil of the skin. However, an exception is made in favour of sea-water, and even a collier seldom returns home unwashed from his visit to Southport or Blackpool. But the institution of bathing-machines is a refinement beyond his understanding, and he occasionally comes into collision with the local authorities through his more primitive notions on the subject. At one seaside place with which we are acquainted, a kind of little war raged for some months on this delicate question. The difficulty was at last solved by some ingenious person discovering that the jurisdiction of the authorities did not extend beyond the limits of the borough, which were placed very near indeed to the bathing-machine station; and henceforth a large company of *al fresco* bathers was wont to stir up the impotent rage of the owners of bathing-vans by taking up a position under their very eyes, and there disporting themselves with a degree of comfort and economy unknown before the date of the great discovery.

Dinner is of course the central point round which the day's arrangements group themselves. It is perhaps a more important event among North-country people in general than among dwellers in the South. It might be a difficult point to decide whether a Lancashire collier or a London house-painter could drink the more. Possibly at the season when houses are generally undergoing repairs and decoration, constant practice might give the victory to the Londoner. But in the matter of eating the decision would certainly be reversed. A party of cheap-trippers in the North would regard with contemptuous surprise the irregular meal, eaten from a basket on the beach, which is so common a spectacle at Brighton and other South-coast watering-places. The streets are haunted by touts from various eating-houses, who sometimes even invade the railway-stations, and captivate their victims by a glowing description of "our two-shilling dinner." The most successful of these places are often kept by local celebrities; some retired wrestler, or champion swimmer, who makes up for bad provisions by the glory of his name and the brightness of his medals, much as Squire Warrington in the *Virginians* sought to divert attention from the smallness of his ale by a magnificent show of family plate on the sideboard. Some streets seem to be entirely occupied by these places of refreshment; from every window issues that savoury steam which, if we may believe Homer, was more grateful to the gods of old than it is to mere human nostrils; while the evidence of ears and eyes suggests that M. Zola might have gathered some valuable hints for his description of a dinner in *L'Assommoir* from observation of English cheap-trippers. It is not surprising that a certain lethargy prevails after dinner; some aid or supersede the process of digestion by a short sail; others drive about aimlessly in huge vehicles furnished with very insufficient horse-power. The majority lounge about the streets in a half-torpid condition, like wasps in autumn. A few of the heaviest ride on donkeys, and a good many children contrive to lose themselves while their parents are indulging in an after-dinner nap. Towards tea-time the crowd revives somewhat, and soon afterwards the town begins to empty itself again.

To all appearance, the one element in the cheap-tripper's composition which raises him much above the lower animals is his love of music. His taste is not refined, but it exists, and only requires cultivation. A small band of itinerant musicians is always the centre of a crowd; and even a blind man singing revivalist hymns to the accompaniment of a concertina draws a tolerably large audience. But the form of entertainment which excites the greatest enthusiasm is a brass-band contest between two or more districts. The town which offers such an attraction is sure of an enormous concourse of visitors. There is generally a considerable amount of betting on the result—indeed it is difficult to imagine a contest of any kind about which a North-countryman would not bet. Party feeling runs high, and all *fortissimo* passages are greeted with shouts of delight, for the cheap-tripper's sympathies in music, like Mr. Pickwick's in politics, are on the side of the stronger. Stringed instruments he holds in contempt, and would no doubt share the opinion of Dr. Johnson on the subject of a violin solo. We should not recommend a nervous vocalist to sing before an audience of cheap-trippers, for their criticisms are expressed in a very outspoken manner, and moreover, if the air of a song is well known, they are apt to interpolate a chorus.

All things considered, it is not surprising that cheap-trippers are regarded without affection by the inhabitants of the places to which they resort. It is not pleasant to see beautiful country overrun by an unappreciative horde intent upon noise and often upon mischief, nor is it agreeable to have the streets rendered impassable for ladies by the presence of drunken roughs. But some excuse is to be found for the unruly behaviour of illiterate holiday-makers in the character of the amusements generally provided for them. They can scarcely be expected to devote a long day to the peaceful contemplation of the beauties of nature, nor, on the other hand, do swings, roundabouts, donkey-rides, and rifle-galleries satisfy the desire of those who have few resources within themselves for something definite to do. We do not venture to suggest any solution of the problem, but it may be respectfully recommended to the consideration of those who profess great anxiety to improve the condition of the working classes. Something has from time to time been done in this direction by owners of great estates, and others who have it in their power to contribute to the enjoyment of holiday-makers, but their efforts are seldom sustained. Some mischief is done, whether deliberately or heedlessly, by members of the crowd, and their entertainer for the future holds aloof from them. He is sometimes, no doubt, over-sensitive; but it is difficult to keep up an interest in people who abuse kindness. After all, the holiday, though it might be better spent, does good physically, if not morally. The benefits of pure air are not destroyed by the utterance of foul language, and fresh scenes, though they are not consciously taken in or appreciated, must afford a grateful relief to the monotonous drudgery of every-day work. The very fact that there is a day in the year to look forward to and back upon gives an element of variety to lives in which variety is not too plentiful. Even a man who is taken home by his wife in a state of stupid intoxication is at least no worse than if his time had been spent in a beerhouse at home. He is certainly not more drunk than if he had been at a funeral.

DAILY BLUNDERS.

LIKE many other old sayings, sacred and profane, that which refers to the blind leading the blind constantly receives fresh illustrations, and we fear that among these must be classed to a great extent a well-meant attempt to keep people clear of some common errors which has been produced under the title of *A Dictionary of Daily Blunders*. This, we are told in a preface, "has been compiled from a collection made by the author during the past twenty years, and the examples are mostly taken from modern literature." It must be admitted that the author has at least shown good judgment in choosing a field whence to take his illustrations; and it is with becoming modesty that he writes that, though "due care has been taken in the preparation of the Dictionary," yet there is doubtless plenty of room for criticism, and the chances are that he will be "proclaimed a blunderer." "If it should be thought," he also observes, "that the blunders are occasionally frivolous, or so obvious that no one would ever make them, we would remind those who consult these pages that many incorrect expressions which one class of people would never think of uttering are used daily by other classes." There is certainly evidence enough, of one kind or another, in the volume before us, of the existence of blunders which could hardly have been suspected.

The lexicographer begins his volume with a paragraph which contains one remarkably safe statement. "'An iron urn and silver teapot were on the table' should be 'An iron urn and *a* silver teapot.' *An* silver teapot is an obvious error." This word *an* seems indeed to have a singular interest for the compiler; for shortly afterwards we find him falling foul of the apparently unobjectionable expression "an unfeeling, grasping man." He has at once perceived that to say "*an* grasping man" would be "an obvious error," and he also perceives that to say "an unfeeling and a grasping man" would be "ambiguous, for it suggests two men." He finds a short and simple way out of the difficulty he has so ingeniously made for himself by substituting "He was an unfeeling as well as a grasping man." The writer is as great on matters of spelling and pronunciation as he is on the nice conduct of the articles; and we shall presently come to an instance in which, with regard to one word, he combines some novel information on both points. Something like the effect of a sudden blow is produced by the amazing statement that "advantageous should not be pronounced ad-văn-tag'e-us, but ăd-van'-tage-us"; and there is a certain surprise in finding that "antipodean should be pronounced an-tip'-ō-de-an." We are not prepared, on the other hand, to deny that by some people "betroth is pronounced be-trōth, not be-trŏth," and it is quite true that *Bon Marché* should not be pronounced "bong marsh"; but we are overwhelmed by two following statements of the Dictionary, which show us blunders which we have constantly, if not daily, committed. Never, we confess, have we pronounced Buenos Ayres as we are now told to do, "Bō-nos Ariz," and never did we know of Byron that "the poet called himself Birn, not Byron." Calais, we learn also for the first time, "is pronounced Kal'-lā," as also that "cayenne is pronounced kāh-yen." On the other hand, it is quite possible that "coz. for cousin is as bad as viz. for videlicit (*sic*)."; although we fail to see where in either case, to use an Americanism, the badness comes in. In contrast to the bold assertion of these passages is the halting observation, true as far as it goes, that "aggravating has not quite the same meaning as irritating, though sometimes used for it." Possibly, however, it is on principle that the author leaves his readers to find out some things for themselves. This view seems to be supported by the oracular observation made under the head "Advertisements." "Errors are often committed through a consideration of brevity." Equally pregnant and equally vague is the paragraph devoted to "anachronism," which "is pronounced ana'-chronism by Johnson, and an-ak'-ron-ism by Walker. Anachronisms should be avoided, as indicating either ignorance or carelessness." These statements are perhaps less valuable than some which settle with a prompt and pleasing decisiveness what have hitherto been moot points. For instance, a discussion has lately been carried on in a

contemporary as to [illegible] Jacques's name, and [illegible] been brought forward and supported [illegible]. It seemed indeed that the controversy might go on for ever; but it must surely stop now that the lexicographer of blunders has delivered himself of this authoritative decision. "Jacques is pronounced shák, not jakes." It is but rarely that the judicial attitude of mind here exemplified seems to be affected by indignation or irritation at the folly of mankind; but, in one instance at least, there is some sign of this. On the word "heinous" the compiler briefly and sternly says, "Look to the spelling and pronounce hā-nus."

It has been observed above that in the case of one word the compiler throws a new light both on spelling and pronunciation, and this case we proceed to quote. "Majoribanks (a family name) is pronounced Marjbanks." That the *r* is not dropped by a clerical error is proved by the position which the name occupies in the dictionary; the *j* for *ch* is of course a more venial mistake. As we go further into the volume the amount of new information bestowed upon us becomes, if anything, still fuller. Who was aware before the publication of this work that Munchausen ought to be pronounced Mun-chaw'sen, mythology with a short *y*, Neufchatel ner-sha-tel, and all the derivatives of "patron" with a long *a*? Before coming as far as this, however, we should have noticed an ingenious grammatical observation given under the word "fling." "The past tense of this verb is *flang*, and the *pa. p.* flung. 'He flang a stone at the rat, which killed the animal, and it was flung into the water.' *Flung* is commonly used for *flang*, but the latter word is grammatically correct." With this we may couple a remark of the same kind with regard to the word "full." "This adjective being in the superlative degree, we cannot properly say 'a fuller bag' or 'the fullest bag.'"

We have noticed that the author, as a rule, pronounces his judgments with singular decisiveness. There are, however, occasions when he seems to be a little perplexed. For instance, though under the head "Americanism" he tells us that such an Americanism as "center" for "centre" is an error and should be avoided, yet he inserts the word "sabre" by itself, and merely remarks upon it that it "is spelled sabor by some American writers." In other cases he has made a sagacious discovery of errors constantly committed by most American and English writers. "Over head and ears," he wisely points out, "is an incorrect phrase; over head must be over ears." This has impressed the lexicographer so much that he repeats his observation under another heading later on. "'The country is over head and ears in debt.' If it is over head it must be over *ears*." So with "head over heels." "'He fell in the water, head over heels.' This is equivalent to saying that he jumped in feet first. 'Heels over head' was no doubt intended."

Returning to the question of pronunciation, we learn with some surprise that *staves*, the plural of *staff*, "should be pronounced starfs, not stā-vs, which is the correct pronunciation of *staves*, the plural of *stave*, a part of a cask"; and this is followed by the assertion that Stephanus is pronounced Stef-an'-us, with the accent on the second syllable. Some curious and instructive sentences might be founded on the information provided for the ignorant by the compiler of the *Dictionary of Daily Blunders*. "Stef-an'-us," we might be told, "and the poet Birn went on a two'ĕr together to Kal'-lā, where they met two poor relations whom they pātronized, and with whom they ate kāh-yen pepper. Under the influence of a glā'-moor they attempted to steal a vaze and some stā-vs from Mun-chaw'sen, but Zhāk came from Ner-sha-tel, flang stones at them, and beat them with starfs. The poet Gur'teh now came to the rescue of the two'-ĕr-ists with a fal'kon, which flew at the assailant and threw him heels over head in the water. After this, those of the party who were over head in debt took refuge at Bō-nos Ariz, where a kum'-rado, who was a far-ma-sū-ti-cal chemist, gave them some pik'-ant quin-in (not kwi-nee'n) to cure them of tis'-is."

Two very odd remarks of the lexicographer's we have thus far omitted. He asserts that in the sentence "*such* a bad character is uncommon," *such* should be *so*. It is not, of course, to be supposed that he really means people to write "so a bad character"; and yet, if he were to be judged by the hypercritical standard of accuracy which he here and there adopts, it would be fair enough to assume this. Again, "round," he says, "does not admit of comparison; but anything not quite round may be described as roundish." This baffles criticism as much as the American proposition, described in one of Max Adeler's books, to build boats in the shape of an inclined plane so that they might run down a level canal. Among all the absurdities, pedantries, and blunders of this Dictionary some good, of course, is to be found. For instance, the compiler is sound on the point of "St. James's, not St. James'"; and he has some good remarks on punctuation. On the whole, however, we are afraid it must be said that the *Dictionary of Daily Blunders* is but a blundering Dictionary.

FRÉJUS.

AMONG the dead cities of the decaying Provençal seaboard there are few more curiously and more hopelessly decayed than Fréjus. Lying outside the commercial revolution which has regenerated the coast from Marseilles to Toulon, as well as outside the [illegible] wave of invalids which now breaks yearly over the eastern shore from Cannes to Nice, it occupies the centre of an intermediate neglected belt, where memories of the past alone are likely to tempt the passing tourist. Indeed the once great and busy Roman port of Forum Julii has now not a single moderately good inn at which even the most hardy archæologist could venture to pass a night of sleepless discomfort. Fréjus can only practically be visited by day-trips from Cannes, and the wise explorer will even then provide himself with luncheon before leaving home, rather than trust to the slender capabilities of the Julian *cuisine*. But if he is content to leave for a while the exquisite scenery of the gulf and islands for the somewhat desolate alluvial delta of the Argens, he will find much to interest and still more to instruct him in the unsavoury relics of the famous colony.

The deep and strongly-marked valley which separates the isolated schistose mountain system of the Maures from the main limestone ranges of Provence pours all its eastern drainage-waters into the sea by the single channel of the Argens. Close to the mouth of the little river as it once flowed, and seated on the lower slopes of the Esterel hills, the old Ligurian village and the newer Roman town looked down upon a bay of the Mediterranean which then washed the very foot of their solid walls. But at the present day the silt brought down by so many mountain torrents has long filled up the whole expanse of the bay, from the outliers of the Maures to those of the Esterel; and Fréjus now stands high and dry, at a distance of no less than a mile from the nearest shore. The view from the town as it actually exists is singularly unattractive, judged at least by the standard of Provençal coastwise watering-places. Not that sea and mountain are wanting from the picture; but their very presence renders it provokingly second-rate. The foreground consists of a wide alluvial lowland, the great sheet of dry and baking silt which has choked up the ancient port, and through whose arid flats the Argens wanders aimless and unseen a mile or two to southward. Only a glimpse of the sea can be caught, like a blue line above the flat plain in the foreground. Beyond the dusty level to the west rise the rounded bosses of the Montagnes des Maures, the old and picturesque stronghold of the Barbary pirates; but their wooded heights lose almost all their native beauty when seen from the side of Fréjus, owing in part to the dwarfing of their perspective by the distance, and in part to the very prosaic foreground of cottage gardens, thick with formal rows of cabbages and artichokes. Eastward, the jagged peaks of the Esterel stand out more boldly against the sky, their naked pinnacles of rock forming a grand chain of saw-like edges, which contrast finely with the tamer outline of the Maures. Nothing indeed could ever succeed in spoiling the poetic grandeur of those Titanic red porphyry teeth, pointed and serrated like the petrified fangs of some gigantic unimagined saurian. But even the Esterel itself looks less massive and less imposing from Fréjus than from any other point of view. The treacherous river which has filled up the port, and thus annihilated the commercial existence of the old town, seems to have carried its malice so far as to have disfigured all its natural beauties, and left it without even the solace of its originally picturesque situation. For it can hardly be doubted that when the waves washed either rocky headland from the red cliffs of the Esterel to the black slaty crags of the Maures, the Roman colonists must have looked out from their battlements upon one of the loveliest amongst all the lovely bays of the smiling Provençal shoreland.

Modern Fréjus has few rivals even in Provence for the narrowness, the dirt, and the discomfort of its streets. Such an abundance and variety of evil odours can hardly be found in any other town of France. The tourist who comes to visit it with his mind full of historical recollections, who expects to find some halo of the Phocæan settlers still clinging around their ancient home, will have his anticipations rudely shocked by the sights and smells which assail him on the way from the railway station to the Porte Dorée. The streets are now unnecessarily encumbered with unwholesome rubbish, and seem utterly neglected even by those Republican authorities who have taken upon themselves so vigorously the task of regenerating the towns of France. The Amphitheatre, just outside the town, and classed amongst the protected historical monuments, is in itself a fine ruin, which would thoroughly repay intelligent care, such as that so well bestowed at Nimes and Arles, in clearing out its encumbered arcades. It is a magnificent building, rudely but solidly constructed in small square stonework of the first century. But at present a cart-road runs from door to door, through the centre of the arena; the interior serves as a sort of supplementary farmyard; waggons and ploughs occupy the arched passages beneath the broken tiers; and the litter of cattle and horses fills up or renders impassable the vaults in many places. The mania for restoration, on the other hand, has taken the place of rational cleansing. Several of the round Roman arches have been rebuilt in modern stonework, whose fresh and brand-new trimness does not add to the effect of the mouldering masonry at its side. Altogether, the appearance of the whole amphitheatre cannot be considered as creditable to French archæologists, as regards alike their acts of commission and of omission.

The ancient walls possess perhaps greater interest, but are hardly less neglected than the Amphitheatre. They enclose a space five times as great as the existing city. Indeed the Roman town must have been one of the first provincial importance. The capital of the Oxybian mountaineers, and afterwards one of the chief factories dependent upon the great Phocæan metropolis of Massalia, it became for a time, after the fall of its mother-city before Cæsar,

the chief seaport of the province. Its name of Forum Julii shows the high position which the Dictator intended it should fill, in the place of unfaithful Marseilles. The massive and extensive ramparts which hemmed it in can still be distinctly traced round their whole circuit, through fields and gardens, while the shrunken modern town now occupies only a small hillock in their south-western corner. The Porte Dorée, the finest of the existing gates, also in masonry of the first century, cannot be closely approached, as it gives shelter in its present state to a few pigs and fowls, and has been closed from public access by a rough wooden door. Like the Amphitheatre, however, it has fallen into the evil hands of the restorer, and has suffered almost as much from excessive affection as from careless neglect. Three or four other gates of less importance, but equally encumbered, are found in other places, and one has fallen a victim to the construction of the modern railway station. The entrance to the old port is marked by an octagonal tower, known as the Lanterne d'Auguste, which doubtless served the purpose of a pharos. The railway now runs on dry land through the midst of the silted harbour, begun by C. Cæsar and completed under his nephew. It must once have covered a considerable space, since Augustus stationed here the two hundred galleys which he had captured at Actium. As late as the reign of Henry II., the port was still serviceable for purposes of war; but the rapid accumulation of alluvium at the mouth of the torrents has long completely severed it from the sea, and Fréjus has now sunk to the position of an essentially agricultural centre.

In the interior of the town, fragments of Roman work, more or less disguised, exist in profusion. Ruins of a small temple, with mixed stone and brick courses of the fourth century, occur in one of the least narrow alleys; and numerous smaller pieces can be noticed among the tortuous lanes by any visitor who chooses to pick his way with care through what the Laureate succinctly describes as "the poached filth that floods the middle street." But the glory of Roman Fréjus consists in its great aqueduct outside the town, one of those splendid works which watered the dry lowlands of Provence under the early Emperors as they have never yet been watered before or since. It is curious that even in our own day, when Frenchmen propose to irrigate the sandy flats of Sahara, the south of France itself is far drier and less fertile than under the rule of the Antonines. The Camargue, that great deltaic island of the Rhône, whose rich alluvial soil now lies barren over thousands of acres for want of irrigation, formed a waving sheet of corn in the days of Strabo, and earned for itself the name of the granary of Gaul. The valley of Arles and the neighbouring plain of the Crau, covered by that vast mass of glacial boulders and pebbles which Zeus, according to the Phocæan legend, hurled down upon the enemies of Heracles, is now once more partly fertilized by the Canal de Craponne, which has but lately restored a semblance of life to the western edges of the stony waste. The Pont du Gard itself is only the chief existing survivor of a vast system of Imperial irrigation works. All along the dry southern coast little ruined aqueducts, like that at Vallauris, still attest the completeness of the Roman arrangements. Of this vast system the Fréjus canal formed a part. Taking its origin from the perpetual torrent of the Siagnolles, twenty miles from the town, it runs across country alternately as a subterranean and an aerial channel, supported in places by single or double arcades, and often flanked by solid buttresses. The masonry belongs to the same type and date as that of the Amphitheatre, and the arches are seldom of equal or regular dimensions. They may be easily followed throughout their whole course. A fine mass, overgrown with ivy and maidenhair ferns, still remains standing in picturesque ruin near the gates of the town.

Among mediæval monuments the most important is of course the cathedral, upon which Fréjus may now be said almost entirely to subsist—at least in a social sense. Though much restored at various dates, it still forms a splendid and characteristic example of Provençal Romanesque architecture of the eleventh century. Its heavy and sombre exterior, almost entirely devoid of ornamentation, has yet a simple impressiveness of its own, by dint of sheer massive solidity. One sees in its strong and straightforward design some impress of that Roman decisiveness which so clearly marks the gates and buildings of the antique city. The interior is striking for its gloom and solemnity, for the vast size and simplicity of its supporting columns, and for the magnificence of its plain vaulted stone roof. Nothing more grand or more depressing can be imagined than the leaden appearance of its blue-grey arches. A few good monuments, some excellent wood-carving, and a picture of the school of Giotto, regilded and repainted with somewhat obtrusive fidelity to its original tints, complete the chief internal attractions. A pair of magnificent oaken doors, however, is kept by the sacristan as a parting treat, and only uncovered by special request. The baptistery, said by local tradition to be adapted from a temple of Diana, and certainly of much earlier date than the main building, rests wholly upon eight fine monolithic granite pillars with white marble capitals, which might well have come down to us from the fourth century. Fragments of Roman fluted shafts are built into the walls of the tower and of the episcopal palace; and the cloisters contain a number of much later clustered columns, extremely light and graceful in design, most of which were unfortunately walled up by the destructives of the Revolution into a solid indistinguishable mass. It is much to be regretted that some of the restoring zeal expended upon the Amphitheatre and the Porte Dorée had not been turned aside to the more useful task of disinterring these buried treasures. To judge by the few samples still visible, the cloister when entire must have possessed a singular and very unusual type of beauty. A single touch which gives vivid reality to the history of Fréjus may be noted in all the *ex-votos*. Every one of these rude and flimsy pictures, belonging to the kind so common in Italian and Provençal churches, shows the Madonna or the patron saint in the act of rescuing some distressed votary, and bears the date of place in the stereotyped form, "In Foro Julii." That form has doubtless come down in unbroken succession through popular tradition from the earliest age of the Church, and its natural occurrence on these naïve pictures is a striking mark of that continuity with Roman thought and Roman manners which is perhaps more noticeable in Provence than even in Italy itself. Visigoths, Burgundians, Franks, and Arabs, each have come and gone again; but Fréjus still retains all but unaltered its Roman identity, its Roman tongue, its Romanized population, and its Roman title of Forum Julii.

THE MISTERY OF THE MERCERS IN CHEAP.

THE association of bodies of citizens engaged in the same trade is probably older than the recorded history of London. Companies, in the modern sense of the word, existed as long ago as the reign of Henry II., and even then it would appear that there were authorized Companies and unauthorized. The mystery of a Company is now indeed its origin and history; but to say so is to misuse the word "mystery." Mr. Riley pointed out its derivation and meaning in his well-known book on the mediæval records of the City. The trade or craft of an artisan or merchant should be called a "mistery"—a word, however, which Mr. Riley avoided, observing that the old words "mestera" or "mestier," usually translated by "mystery," and the obsolete "mistery," really refer to the Latin *ministerium*, "a serving to," and not to *mysterium*, "a secret." The oldest "mistery" is the Saddlers', yet they were never reckoned among the so-called "great Companies," and precedence has always been yielded to the Mercers, although their earliest charter was only granted by Richard II. This application, by the way, of the word "company" is wholly modern, and has never been the formal title of any of the City Guilds. "The Master, Wardens, Court of Assistants and Generality of the Mistery of Mercers" appears to be their full title; but in their oldest charter they are "Homines de Misteriæ Merceræ Civitatis London." How far such Guilds or Mysteries were established for mercantile and how far for religious purposes need not be discussed here; but there can be no doubt of the close connexion that every City Company originally kept up with the Church. Charitable objects, pensions to poor members and their families, and especially education, have always been among their chief concerns; so that it is not quite correct to say that they do not fulfil their primary functions, even though they may have nothing to do with trade or its regulation. From their first incorporation each Mistery has been the trustee of funds for various kinds of charitable ends—ends still attained in most cases, no doubt, and as much the final cause of the existence of the Companies as any special work which they may at any time have carried out in the way of commercial business.

The Mercers may have been originally a trading Company in the modern sense of the words. The best authority on the history of the City Companies says that they continued to trade as late as the reign of Elizabeth; but there are reasons to doubt the correctness of this view. It is certain, however, that at a very early period they formed a guild of traders, and set up a hall for themselves on the north side of Cheap. The site of their hall became the chapel of the Priory of St. Thomas of Acon, and they removed to larger premises in the middle of the market-place, where there was a field, which from its contiguity was called after the King's shed or booth, for witnessing tournaments and processions in Cheap, the Crownseld Field. It was situated between the modern Friday Street and Bow Church, and must have been a remnant of the ancient open market-place, or possibly a waste unbuilt upon, though enclosed within the great Roman wall erected in the fourth century. That many such places existed within the City boundaries there can be little doubt; but whether they had never been built upon, or whether they fell into desolation after the departure of the Romans, history is silent. This one in particular cannot have been very large, and early in the thirteenth century it was covered with the tents and booths of the permanent fair of which Cheap so long consisted. "For I read," says Stowe, "of no houses otherwise on that side of the street, but of divers sheds." This mention of "divers sheds" is very interesting. It not only betrays to us the condition of the great City market-place—the *Forum*, as it was called—but also gives us a clue to the meaning of the modern name "Cheapside." The Cheap consisted, perhaps even in Saxon times, of two oblong spaces. One was north of the main thoroughfare, and eastward of the royal precincts of Wood Street and Adel Street. It comprised Milk Street and Ironmonger Lane, and in its most southern part was the Poultry Market. The other portion lay southward and westward, and included the head-quarters of fishmongers, money-changers, sopers, salters, and mercers. The roadway was along the northern side of the market as far as Poultry, through which it ran to the bridge over the Walbrook over against the church of St. Mildred. In the centre of this space was afterwards a tilt-yard, and near it, surrounded by its burial-ground, the great church of St. Mary, with the crypt of lofty arches which gained it the name of Bow Church. Such

was Cheap, and Cheapside was the roadway along the north side. There was no Cheapside at Eastcheap. There the market was held at the cross roads. But when we speak of Cheap, or Westcheap, we mean not Cheapside alone, but Old Change, Friday Street, Bread Street, Milk Street, Honey Lane, and, in short, all the different thoroughfares which now by their names only point to the time when they were alleys of booths, or, as they were called, selds, in which the sellers of different wares kept up a constant fair. Similar examples are to be found in many towns. There is one at Troyes, as was pointed out in these pages eleven years ago. There was one at York. The archæologist of the present day, who is never content till he can find out the meanings of old names, does not take the addition of "side" to the name of Cheap as being a matter of no consequence; but this solution, affording as it does a working theory of Cheapside, so to speak, may perhaps be considered satisfactory till a better has been discovered. That the Romans should have included so large a piece of vacant land in the circuit of the wall may be accounted for on various grounds. It was probably not built over in their time. No pavements or other signs of Roman buildings have been found there, but beyond, near St. Martin-le-Grand, there are such traces, and it is perhaps not hazarding too wild a guess to suppose that some important public building stood near where Guildhall stands now, or between it and Goldsmiths' Hall—perhaps the country villa of the governor. The walls swept round it to afford it the protection wanting in the year 296, when, as we read, the mercenaries of Allectus easily plundered London. It must, however, be allowed that without the existence of some such building the wall may have been laid out on the nearly oblong plan which the Romans so much affected, and that an empty place, lying on the north side of the Watling Street, was taken in merely to give the wall a straight line from Bishopsgate to Newgate.

The Mercery thus established in the Crownseld meadow speedily became the most important place in Cheap. Henry IV. gave to the Mistery the Crownseld itself, and together with it the "seldam," a gallery from which kings had been wont to witness tournaments and processions, a kind of grand stand, which Edward III. had made close to Bow Church. The balcony on the tower of St. Mary-le-Bow, looking out on Cheapside, may be considered its lineal descendant—the representative, in fact, of that gallery of stone which Edward erected on the memorable occasion when, as Stow says, a wooden scaffold had been put up. "The higher frame in which the ladies were placed brake in sunder, whereby they were with some shame forced to fall down, by reason whereof the knights and such as were underneath, were grievously hurt." The Queen, he continues, took great care to obtain the pardon of the carpenters, and "thereby purchased great love of the people." Although this royal seld was granted to the Mercers, it continued to be used by great folk, and hence Queen Anne saw the pageant of the Lord Mayor in 1702.

The Mercers dealt in many things besides silk. In fact, as the name seems to imply, they were at first general merchants. They sold not only cloth, but even spices and drugs, and in short everything that went by retail. They first among the Companies sent out and established agencies in Continental towns. Though the company of Merchant Adventurers included men of all misteries, the Mercers were greatly in the majority; and the head-quarters of the Adventurers were at Mercers' Hall. In 1438 Master Robert Large, a mercer, received as an apprentice one William Caxton, and in course of time William Caxton became "Governor beyond the sea" of the Merchant Adventurers at Bruges. His position there enabled him first to patronize, and afterwards to learn, the art of printing, and to import a new mistory to England. There have been many other illustrious persons of the craft. Whittington and Gresham were both mercers, but the number of royal members of the premier Company has been small, though Queen Elizabeth was free of this mistery. Before her time, however, the old site of the Mercery had been abandoned, and the Company had returned to their original quarters on the north side of Cornhill. Their entrance porch stands where stood the house of Gilbert Becket, the father of St. Thomas of Canterbury; and here Agnes, the martyr's sister, and her husband founded a hospital in his honour, though before his actual canonization. All the authorities assert that it derived its name of the Priory of St. Thomas of Acon, or Acre, from the memory of the lady who traditionally followed Gilbert from Palestine. But Canon Robertson has pointed out that the connexion of Acre with the name originated in 1190, when, on the taking of Acre by the Crusaders, an order in honour of St. Thomas was founded there. At the dissolution the Mercers obtained the site, and, establishing a school in the chapel of St. Thomas, let the crypt as a store. Here they remain, their present buildings, which cover the site of the hospital, having been erected after the great fire by Jarman, the city architect. The old chapel had been known for its Italian sermons, which were encouraged by the Merchant Adventurers; and here Anthony de Dominis, the eccentric and unfortunate Archbishop of Spalato, preached in 1617.

ISLANDS OF THE BLEST.

"EOTHEN," in his romantic chapter on Lady Hester Stanhope, remarks that those who are wearied with the vanities of the world incline irresistibly towards the East for repose. One of Mrs. Bardell's female friends at the memorable tea-party at "The Spaniards" expressed a very similar idea from the more vulgar and middle-class point of view when she said that there was nothing like the country for a wounded spirit. For our own part we have always fancied that, if we were mentally ailing and longing for relief, we should seek our retreat in some island home. Speculating vaguely on a highly improbable contingency, we have hesitated between the islands of the South Seas and the Shetlands. We are fully alive to the bewitching fascinations of the former. We are sensible of the soothing influences of a voluptuous climate, where, lulled in your siesta by the murmur of the surf breaking softly on the beach under the shadows of the cocoa-nut palms, you might forget all the unpleasant memories that haunted you, and look listlessly to the future in the mood of the lotus-eaters. We realize the glories of tropical vegetation; of the limpid natural *aquaria* shut in by coral reefs; of the perpetual sunshine and the perfection of moonlight, only overcast at rare intervals by some downpour of rain or a devastating tornado. We appreciate the economical conveniences of a climate where you may live on fruits and vegetables that may be had almost for the gathering; where you may disport yourself in the lightest raiment cut in the simplest fashion; and where you may dispense even with the shelter of a roof, save at exceptional seasons. We remember how islands like Otaheite or the Sandwich group exercised an irresistible fascination on our early navigators, provoking the mutineers of the *Bounty* to a crime, that they might sail back even through blood to the earthly paradise of which they had had a glimpse. But then, on the other hand, we have had reason to suspect that in reality earthly paradises are non-existent. Delicious climates like those of Otaheite and Honolulu have their drawbacks. The faculties rust with disuse or neglect; inactivity, whether voluntary or enforced, develops latent diseases; you become a martyr to rheumatic gout or dyspepsia; and you are sure in any case to suffer intense irritation from the insect pests that swarm in those latitudes. Moreover, the most determined misanthrope, whatever may be the strength of his convictions, prefers to leave himself a loophole and a *locus pœnitentiæ*, and the sunny archipelago of the South Seas is a very long way from London. Now we have hitherto supposed that, for all practical intents and purposes, the Shetlands were nearly as much out of our world; but in sober fact, and according to the advertisements of the Steam-packet Companies, they lie within easy reach of the railway station at Aberdeen. *Omne ignotum pro magnifico*, and we did not know very much about them; which in itself is no small recommendation. They may be included in the Scotch guide-books, and very likely they are; but, for ourselves, the author of *Waverley* was the latest trustworthy authority, and our notions of the Shetlander came from the pages of *The Pirate*. So far as the topography and the scenery go those pages are as trustworthy now as ever. Scott had cruised round the coasts of the archipelago in the yacht of the Commissioners of Northern Lights, and had made minute observations, as was his invariable custom. We knew all about the Fitful Head and the Roost of Sumburgh, and had mastered the general configuration of those land-locked *voes* which run inland among the sand-hills or the scarped and seafowl-swarming precipices. Naturally we never greatly fancied the climate, though it is damp or stormy rather than bitterly cold. We have a prejudice in favour of timber and some amount of foliage; patches of barley and stunted or half-starved oats are but a poor substitute for bananas and bread-fruit groves. Flat peat mosses soon begin to pall upon one, even when varied with reaches of desolate beach. And we might possibly find clusters of hovels resembling Hottentot kraals an unsatisfactory contrast to the villages of merry England, or even to the "douce" and solidly-built townlets that are to be found in southern Scotland. But then our memories of the mansion of Magnus Troil at Burgh-Westra cast a halo of romance over the storm-beaten country, so far as life within doors is concerned; and the howling of the elements without makes festivities within all the more agreeable. Supposing that you withdrew thither in the possession of moderate means, you might make yourself as happy as a king on very reasonable terms. You would begin by hiring a deserted residence like that of Jarlshof, at an almost nominal rent. You would raise your own beef and mutton, or buy your butcher's meat for a mere song. Sea-fish and lake-trout would be to be had for the catching. You would supply your cellar with schiedam and unimpeachable cognac from contraband skippers who were always dropping down upon the coast. Should you tire by any chance of your own society, you would only have to send to catch a pony on the nearest bog, and ride off to the Magnus Troil of the neighbourhood, who would give you hospitality and house-room for as long as you cared to stay. And apparently, in that austere but favoured clime, headaches and liver complaints were almost unheard of. You might carouse from early supper-time to long past midnight; you might rise to recruit yourself with the most substantial of breakfasts; and, notwithstanding these habitual liberties, might rely upon dying in a green old age, unless you happened to go down at sea, or have some fatal accident in fowling.

Such were our pleasant fancies as to life in the Shetland Isles; but we confess that they have been in some degree dispelled by the letters that have lately been appearing in the *Times*. Those letters are extremely readable, and apparently exhaustive of the subject. And we gather from them that, while existence in that region is as primitive as ever, it is by no means altogether so pleasant as it used to be when Scott imagined it some-

where towards the close of the seventeenth century. There are well-to-do proprietors, who have built themselves mansions which would dwarf the modest building of Burgh-Westra; nor have we any reason to suppose that these Shetland lairds neglect the reasonable duties of hospitality. But now that inns have been established in the capital of Lerwick, and that passenger steamers ply thither at regular intervals, we cannot expect the local magnates to keep open house like Magnus Troil, the monarch of Amphitryons. Should you decide to venture on that northern voyage nowadays, still more should you emigrate for a protracted sojourn, unless you mean to be satisfied with your own company, you ought in prudence to be provided with good introductions. We doubt whether many houses, even as dilapidated as Jarlshof, are going a-begging. And we are sure that summer lodgings in one of the sequestered rural villages would be altogether out of the question. We hear of an aggregate of turf-roofed huts that may be either cowsheds or human habitations. The smoke escapes by the hole that throws light down on the fire-place, and fires must be kept going for the best part of the year. The tiny windows are darkened with the filth that has gradually gathered on them. When the doors are left open, the pigs, goats, and poultry have free admission to the family circle; and should the doors be closed against storms or snow-drift, the inmates are smoked and dried like the surplus produce of their fishing-boats. Nor, so far as sanitary matters are concerned, can any hard and fast line be drawn between the dwellers in the country and the inhabitants of the towns. The chief street in the picturesque capital of Lerwick is a bustling thoroughfare, something less in width than the narrowest of the narrow pavements in Fleet Street. If one drives along it in a pony-cart, the most pretentious of the wheeled carriages of the country, and chance to meet a wheelbarrow coming from the opposite direction, all traffic is suspended while the passage is being effected. The side lanes are some of them not more than three feet broad, so that even the cramped architecture of the sunniest cities of the East is surpassed in one of the most dripping climates under heaven. It is fortunate that the steep pitch of the ground carries off much of the sewage by force of gravitation; otherwise the little metropolis might be positively stifled in odorous effluvia. That there is excessive infant mortality is by no means wonderful; the marvel is that so many of the children should manage to struggle through their tender years under conditions so terribly unfavourable. That sturdy men and buxom women are bred in Shetland is certain; and they need all their stamina and powers of endurance. The struggle with nature for bare subsistence is hard and incessant. When the fishing-boats stand out on a cruise it is in some of the most treacherous narrow seas in the world; accidents, of course, are not unfrequent; and when the people have an unprecedentedly successful herring season, as in the present year, the surplus fish is wasted, and prices are lowered accordingly. The harvests of the hardiest kinds of grain must be won in the face of the most unfavourable weather; and we fancy that the agricultural implements are still nearly as primitive as when Triptolemus Yellowley longed to improve them. The women, as in all struggling and semi-barbarous communities, do far more than their share of the common work. We are told that they are to be seen toiling homeward under their heavy creels of turf from the moor; and yet even while their bodies are bent double under their burdens their fingers are indefatigably busy. They are knitting the fleecy Shetland hosiery which is sold at fancy prices in our West-end warehouses; but the original work is miserably remunerated. We should imagine that an enthusiastic anchorite, with some remains of human feeling in his heart, who had withdrawn to these storm-beaten solitudes, would be perpetually laid under contribution for the wants of his poverty-stricken neighbours. Doubtless he might luxuriate by way of compensation in the grandeur of stern scenery. The rocky headlands that have been hollowed out in labyrinths of caverns by the relentless force of the Atlantic breakers are of course magnificent; and if you have head and nerves for the sport of sea-bird-fowling you may indulge in its pleasures to your heart's content. But, except for tolerable trout-fishing in the lochs, there is an absence of all the milder forms of amusement as of the softer charms of nature. There are hares on the cornland and there are rabbits among the sandhills, but there are no grouse on the moors, and but few small birds in the hedgerows. The sojourner's daily walks would alternate for the most part between the shingly beach, the shifting sands, and the quaking peat mosses. And if you had nearly perpetual day through some part of the year, much of the rest would be blotted out in mist and storm, clouds and darkness. So that, on the whole, striking the balance between the advantages and disadvantages of the Shetlands, we come to the conclusion that, though they may be a tempting object for a flying trip, they would be the reverse of enjoyable for a prolonged residence.

REVIEWS.

DUTT'S INDIA, PAST AND PRESENT.*

MR. DUTT is an industrious writer. More than a year ago we made some remarks (*Saturday Review*, June 21, 1879) on the two portly volumes which contained his *Historical Studies*, and of which the work now before us may be regarded as a continuation. He is also an industrious thinker; and much of what he says is well deserving of attention. But neither in this volume nor in his *Historical Studies* does he do himself justice. In both the pruning knife might with advantage have been used freely, and Mr. Dutt would have done well to determine more clearly the limits of his own knowledge. As in the former, so in the present work, he writes sensibly and forcibly on matters with which his education and experience have made him competent to deal; but in both he strays away into other matters of which he has no real grasp, although his conclusions about them are as confidently expressed as his thoughts on subjects which he has carefully worked out. It is unfortunate that in each work these crude and not very coherent speculations are obtruded on the reader in the opening pages, and that there is need both of patience and perseverance before we can discover that the book cannot fairly be dismissed as the superficial talk of an inexact and half-educated writer. In both works he shows that he has carefully studied the past history and the present condition of India, and that his knowledge of the habits and wants of the people justifies his speaking with authority on many questions of practical importance; but it is not less clear from both that he has but vague ideas of the laws of historical evidence, and that he is especially incompetent to deal with the history of the ancient world or with matters relating to the origin and growth of languages. His chapters on the existing effects of caste and on the present state of religion in India, on the capabilities of the country, and on the modes in which these capabilities may be best drawn out for the strengthening of British rule and the improvement of the revenue, are really valuable, and should be carefully read and considered; but the reader might be pardoned who should conclude from the opening sentences that it was a mere waste of time to go further. It is, of course, possible that the Hindu may not have migrated from distant regions into the lands where we now find him; but the whole method and results of philology cannot be upset in half-a-dozen words, and the cool assurance which treats them as little better than delusions is more likely to injure the reputation of a writer than to carry weight with his readers.

The truth is that whenever Mr. Dutt deals with questions of language or of the history of times for which we have not the evidence of a contemporary historical literature he betrays inexactness of thought, and the necessary result is great inequality in his work. It is more than provoking to be told that, in determining the relations of tribes and nations, "a coincidence of words and sentences" in the dialects spoken by them is not a safe and trustworthy guide. A little consideration would surely have convinced Mr. Dutt that between words and sentences there is all the difference in the world. The former are mere counters or labels which any language may borrow from another, suiting their shape to its own needs; the latter must be put together grammatically, and the grammatical structure of speech answers exactly to the anatomical structure of animals. If one dialect cannot be distinguished from or compared with another in the likeness or unlikeness of its forms which are absolutely dependent on law, then the attempt to determine the relations of vertebrates by the likeness or unlikeness of their skeletons must be also useless. It is of course easy to push too far conclusions which the evidence of language may seem to warrant; and among those which must be modified may be the theory which looks on the parent of the vast multitude of Aryan dialects as the speech of a single Aryan community in its primeval home. It is possible, as Mr. Sayce has pointed out, that this primitive language may have been spoken by a race essentially different from that to which we belong, or spoken by more races than one. It is also possible that there may have been no one original dialect. Languages can be preserved from endless dialectical variations only when they are brought under the artificial conditions imposed by a written literature. But these and other points of detail, whatever may be their importance, have not, after the lapse of nearly a century, affected essentially the assertion of Sir William Jones that "no philologer could examine the Sanskrit, Greek, and Latin without believing them to have sprung from some common source." The results obtained by the methods recommended by him, and by the correspondents of the French Academy before him, have exceeded any expectations which the most sanguine could have dared to form at the beginning of the present century; and amongst these results is undoubtedly the position that there is, if we speak generally, an affinity of blood between the peoples and nations which have a common inheritance in the wide-spread Aryan dialects. The inferences drawn from this position must be applied cautiously in individual cases; and it may be only very partially true that there is a common parentage for the Hindu and the Englishman. But it is simply preposterous to say, as Mr. Dutt plainly says, that "the idea is based on a fancied similitude between the Sanskrit, Persian, Scythian, Celtic, Hellenic, Gothic, and Slavonian languages." His own conclusions and speculations are not less rash. Both Persians and Hindus spoke of themselves as Aryans; but the latter, at least, have always inhabited the countries in which they are now found. Yet it seems that Persians and Hindus wished to have a common name because "they were anxious to be distinguished" from other races by which they were encircled, and that "to this end they both took to themselves a name coined for the occasion, which from their continuity to each other they adopted in common." But the Persians and Hindus were akin neither in race nor in language; and we are not told how they manufactured their common title. It is all very puzzling and very strange; and it is not easy to discover the canons

* *India, Past and Present; with Minor Essays on Cognate Subjects.* By Shoshee Chunder Dutt, Rái Báhádoor. London: Chatto & Windus. 1880

of Mr. Dutt's critical system. There is no affinity between Persians and Hindus, because the latter were "scholars of high culture and taste," while the former were "never anything beyond soldiers and politicians." The difference, we might suppose, could be accounted for, so far as it exists, on other grounds; but the argument, if it be worth anything, would prove that Spartans and Athenians could not both be Hellenes. To make the puzzlement greater, the Brahmans have never had any other than their present abodes; yet it seems that at some time or other they separated from the other Aryans and "went through their own special development on the banks of the Indus," by crossing which river they immigrated into the Punjab.

It is unnecessary, however, to cite further instances of inexactness and confusion in order to show that Mr. Dutt would do well to avoid questions of ethnology and language. In the history of religion in India he is much more at home, and has much to say for which he may justly challenge careful attention; but even here his work is marred by some unfortunate inconsistencies. In one place we are told that the worship of the Vedic age never rose, "except in a very undistinguishable form, above the worship of the great objects by which they were surrounded"; and this is said in apparent agreement with the opinion of Professor H. H. Wilson, that the authors of the Hymns had probably no belief in a Creator or Ruler of the universe. In another passage we are told that there was no competition among the Vedic gods, and that as each was mentioned, there was "for the time at least only one Supreme God, which may be understood as implying an undercurrent of monotheism in the midst of mythology." Monotheism and unbelief in a Creator cannot well go together; and such loose writing impairs the authority of those parts of the book which deserve to be spoken of in terms of high praise. Two of the most useful chapters in the volumes treat of the growth of caste and of the present condition and effects of the institution in India. The origination of caste from conquest is, and may perhaps remain, a vexed question. Mr. Dutt thinks that the theory is not warranted by the Rig Veda or Menu. The myth that the four castes proceeded from different parts of the body of the Supreme Being seems to show that there were no essential differences of race between the several classes; and if the notion that caste has grown out of conquest be true, Mr. Dutt says it is true only so far as conquest affected the internal relations of the conquerors. In order to distinguish them from the barbarians, or *dasyas*, whom they brought under their yoke, the first thing to be done was, in his belief, to classify the victors "according to the duties which their conquests imposed on them, and the first three castes were thus called forth, being simply gradations in the body politic rendered necessary by the acquisition of an empire." The alien population might to any extent be absorbed into the lowest caste, with which the first three had in strictness of speech nothing to do. But the true spirit of caste was not permanently confined to the ranks of the Brahmans, Kshatryas, and Vaisyas. The casteless came gradually under its influence, and set up caste distinctions amongst themselves. "Instead of four divisions there are now more than forty, which, for all social purposes at least, are as distinct from each other" as the members of the first three ever were; and the institution of caste seems to be gaining strength generally throughout the country rather than losing it. This, Mr. Dutt believes, is in great part the result of Mahometan dominion. Under the yoke of the followers of the Prophet, Brahmans, Vaisyas, Sudras, and Barnasankars were all alike slaves, whom they all equally hated; and by way of raising up a barrier between themselves and their conquerors, "the injunctions of the Shastras came to be strengthened by stringent bylaws, and to be oppressively enforced." To Englishmen the characteristics of caste must be matters of curiosity rather than of real interest. They cannot be expected to care much about the identity or the distinction of caste or rank. In point of fact, caste and rank have nothing to do with each other. In the social scale the Barnasankar may be indefinitely higher than the Brahman; but the latter is endowed with privileges and receives an honour which the former can by no possibility attain to. The question of caste can in England attract attention only in so far as it affects the welfare of the people of India; and as interposing an obstacle in the way of their improvement generally, and more especially as checking or repressing all political growth, it becomes a matter of extreme importance. The difficulties involved in it are, in Mr. Dutt's opinion, far more serious than we in England are apt to believe. In its practical working caste is, as we might suppose, an almost intolerable despotism. The enforcement of its observances cannot be trusted to the members of each caste as individuals; and the result has been the growth of a class of inquisitors, who make their pecuniary profit out of the infringement of its rules. It is impossible for the Hindu to escape from the *pardmániks*, who are perpetually "prying into the minutest privacies of life," under the pretence of seeing that nothing is amiss. "A son or a daughter," Mr. Dutt tells us, "cannot be given away in marriage, friends cannot be entertained, ceremonies cannot be performed, without the permission and co-operation of these social harpies, such co-operation having, of course, a price attached to it; and if a wife or daughter is suspected of frailty, or a son or brother accused of irreligion, the unfortunate family is always shorn to the quick, with not even the privilege of complaining left to them when their caste is spared."

The worst mischief lies probably in the utterly illegal tyranny which in this and other ways is exercised over the people. The law would give them redress, but they dare not resort to the law; and while they are thus bearing a yoke which their rulers would never impose on them, the results are disastrous to themselves politically and socially as well as morally. Caste is multiplying their divisions indefinitely, and on this account it was "encouraged and fostered by the Mahometans." Mr. Dutt justly adds that "a hearty national union under a people so constituted can never be hoped for; no necessity or general misfortune will yoke the Brahman and the Barnasankar side by side, in one common cause. If they were found banded together for a time during the Mutiny of 1857, it is certain that that confederation would never have outlived the passing hour." Of the institution and its effects he has no hesitation in saying that its mischievous restrictions have brought civilization to a standstill in the country, and that there is no hope of improvement until these restrictions are removed; but in the expectation of any change, early or late, he puts no faith, while he ascribes the resistance to caste made by the party known as Young Bengal to motives so discreditable that any real reformation from such a quarter is not to be looked for.

The illegal oppression exercised through the institution of caste is exercised also, to an extent scarcely less burdensome, under cover of the Perpetual Settlement of Lord Cornwallis. The collectors deal with the zemindars only; the zemindars impose on the ryots payments of which the law knows nothing or which it expressly declares illegal. But, as in the matter of caste, the ryot practically dares not complain; and the result is not merely a large amount of misery amongst the cultivators of the soil, but a very serious loss to the revenues of India. This loss has been computed loosely at 10,000,000*l*. a year; it may perhaps be put at 7,000,000*l*., and can scarcely be estimated at a very much lower rate. Between the ryots and the officers of the Government there is no intercourse, and indeed no contact; and in some cases the number of illegal cesses found existing has been not less than ninety-seven. The reconsideration of an arrangement which has no just title to be regarded as a law of Medes and Persians may perhaps suggest measures that would speedily lessen and remove the disaffection now spreading amongst many classes of the people. On subjects of this nature Mr. Dutt's remarks are always judicious, and his arguments are urged with a force and clearness which entitle them to the serious attention of his readers.

MAHAFFY'S CLASSICAL GREEK LITERATURE.*

NO one probably will be prepared to deny the truth of the statement contained in the first sentence of Mr. Mahaffy's preface, that "a history of Greek literature has become almost too great a task for any single man to accomplish adequately." To gain a thorough knowledge of the various Greek authors themselves, as well as of the vast mass of commentary and criticism which has gathered round them, is enough, and more than enough, to constitute the study of a lifetime. But beyond this special knowledge a wide acquaintance with general literature and a highly cultivated taste are necessary for the adequate treatment of the subject; and to these should be added a large share of common sense, a quality which is not best developed in the seclusion of the library. We may here be met by a retort akin to that with which Rasselas checked the poetic enthusiasm of Imlac; and no doubt the magnitude of the subject is enough to terrify any ordinary scholar, and to turn his attention to monographs on individual writers on the one hand, or to the composition of a primer for beginners on the other. Mr. Mahaffy's history does not profess to be in any sense an exhaustive treatise. It is intended, we are told, for the use of "younger students," by whom are probably meant undergraduates reading for honours; and though a book which consists of about a thousand pages of closely printed and carefully condensed matter can scarcely be called a short one, it is at any rate very much less voluminous than such a work as Mure's, while it embodies in a convenient form the substance of what is known about classical Greek authors. It may be doubted whether the general plan of the work is such as best to convey to "younger students" a good general knowledge of the history of Greek literature. Too much is said about each writer, and too little about the development and progress of literature at large. The result is that the book is biographical rather than historical in character. It wants continuity, and does not sufficiently explain the mutual influence of the various authors. A work composed on this plan may be, and in the present case assuredly is, most valuable as a dictionary; but the fact that names occur in chronological instead of alphabetical order does not at once convert it into history.

Regarded as a contribution to our critical knowledge of the great Greek writers, and not as a means of educating youth, the book deserves very high praise. As a critic, Mr. Mahaffy is entitled to an important position among commentators on classical literature. Sound common sense and breadth of view are the leading characteristics of his style of criticism, and he revolts as much from the pedantry and dulness of one great school of modern critics as from the neglect of details and complacent optimism of the other. His remarks on the relations—or, rather, absence of relations—between English and German critics, and his statement of the merits and defects of each school may be read with advantage by many scholars beside those for whom they are more especially intended. While he allows the Germans all credit for

* *A History of Classical Greek Literature.* By the Rev. J. P. Mahaffy, M.A. London: Longmans, Green, & Co. 1880.

their labours in the field of Homeric research, he has little sympathy with their general canons of criticism, and points out how fallacious is their favourite practice of making literary merit the ultimate test of the authenticity of any passage. The fact that widely different verdicts are often pronounced by various critics upon the same passage is of itself sufficient proof of the inadequacy of the test, and moreover, as Mr. Mahaffy suggests, the very excellence of a later lay may often be the cause of its being interpolated in an earlier composition. Mr. Mahaffy here lays much stress upon the national isolation in scholarship, and is of opinion that the contrast of attitude has been so strong as to blind each nation to the importance of what has been said by the other. He suggests as an alternative explanation that few scholars of either country are able fully to appreciate the force of an argument in the tongue of the other. There may be some truth in both explanations, but probably English critics have been guided in the matter of the Homeric poems rather by sentimental considerations than by any other feelings. Holding as he does that ignorance or carelessness is the cause in each party of blindness to the arguments of the other, Mr. Mahaffy is naturally more in sympathy with Grote than with any other critic of the Homeric poems, and he holds, in the main, Grote's intermediate theory about the Iliad. He strengthens his position by the authority of Professor Sayce, whose summary of the results of linguistic criticism on the text of Homer is printed as an appendix, and who arrives, on different grounds, at substantially the same conclusions as those of Mr. Mahaffy. While speaking of this branch of the subject we may mention that Mr. Mahaffy's opinion of German scholarship seems to grow lower as he proceeds. He gradually imbibes all the British prejudices against which he protests in the earlier portion of the work, and he finally arrives at the conclusion that the most appropriate piece of work for a "learned German" would be the re-editing of the fragments of Ctesias, with all the monumental evidence as to his trustworthiness appended. Mr. Mahaffy's own method of treating Greek literature, as compared with that of German scholars, reminds us forcibly of the familiar story of the way in which a German and an Englishman respectively executed the order given to them to describe a camel. The Englishman, we are told, packed up his portmanteau and started off to study his subject in its native deserts; while the German remained quietly at home and evolved a camel out of his inner consciousness, much as the Italian painters would seem to have done in depicting the Adoration of the Magi. Mr. Mahaffy has travelled widely in Greece, Italy, and Sicily, and brings the knowledge thus acquired to bear upon his present task. His observations on the Greek theatre derive much force from his visits to the various ruins extant; and his theories on the mechanical contrivances of the Greek stage, founded on an inspection of the remains, are worth more than whole volumes of *à priori* argument. No doubt he goes too far when, from the fact that he could distinctly hear every word uttered in a man's ordinary speaking voice across the amphitheatre at Syracuse, he draws the conclusion that the acoustic properties of these vast theatres were much better than would naturally be supposed; for, to say nothing of the buzzing sound which must at times have arisen from so large an audience, however attentive it might be, it is not necessary to be an actor or singer to know how sound is broken and deadened by the mere bodily presence of a number of people in a theatre. Indeed Mr. Mahaffy's arguments occasionally remind us of the ingenious showman who justified his peculiar pronunciation of the word pelican by the plea that he had "seen the animal."

The chapters on the Tragedians are perhaps the most interesting in the whole work. Mr. Mahaffy is never afraid of contradicting generally received opinions, and it is pleasing to meet with a critic who will venture to uphold the claims of Euripides to equality at least with Æschylus and Sophocles. The decision arrived at on the question must of course depend on the individual taste of each reader; but it is easy to understand that any modern student not thoroughly imbued with the Hellenic spirit would pronounce Euripides superior to Sophocles. Even such a Greek scholar and sympathizer as Mr. Mahaffy, while he pronounces Sophocles to be the better artist, ascribes to Euripides the greater genius. But this is not the place to discuss the question, which, in many of its aspects, bears a striking resemblance to the contest between the Classical and the Romantic drama in France during the present century.

In his estimate of Pindar Mr. Mahaffy dissents more widely from the general verdict. He lays much emphasis on the fact that Pindar wrote for pay, and discovers with great, perhaps too great, ingenuity, that the splendour of the ode depends very much upon the price paid for it. Thus the superiority in grandeur of the Olympian odes is accounted for by the explanation that they were composed for great personages, and probably were splendidly rewarded. In the same way the rarity of odes addressed to Athenians is ascribed to the poverty of Athens at the time, while the wealth of the Æginetans and Sicilians accounts for the large place which they occupy in Pindar's poetry. As regards the literary merit of his odes, of course the elaborate character of his metrical system, in which the rhythm is entirely lost to modern ears, and the transient allusions which have long since become devoid of meaning, have inclined judicious critics to judge of Pindar rather by his reputation among his own countrymen than by the merits which they have been able to discover for themselves.

The second volume, which deals with prose literature, is, on the whole, very much less interesting than the first. We do not at all mean to imply that it is less valuable from an historical point of view. On the contrary, Mr. Mahaffy presents a much more connected history of Greek prose than of Greek poetry; but his own interest seems to be centred in the poets, and moreover, except in one important case, his estimates of the various writers do not differ widely from those which are generally received. Hence there is less original criticism in this than in the other branch of the subject. Mr. Mahaffy's opinion of Xenophon, however, is at variance with that most commonly entertained, and diametrically opposed to the indiscriminate admiration of Grote, who sees in him the model of an Athenian gentleman, and a splendid specimen of the results of a democratic education. He is here described as being essentially a second-rate man in every respect, dominated all his life by any great man whom he met—Socrates, Cyrus, Agesilaus; "a mere Boswell, a photographer who copies petty details, but, being no true artist, is unable to catch the ideal side of the character, and reproduce it for all time." The *Anabasis* is set down as an elaborate piece of self-glorification, "where the author, without fear of contradiction, seeing that the main actors were now dead or scattered, could assume an importance quite beyond that warranted by the real facts." Mr. Mahaffy even goes so far as to suggest that the publication of the work may have been delayed by Xenophon through his fear of being contradicted by the surviving leaders had he put his own prowess so strongly forward while they were at hand to correct him. Surely, in the absence of positive evidence on the matter, such a suggestion as this comes under the same head as those unjust insinuations of which Mr. Mahaffy complains in Xenophon's treatment of Epaminondas.

In this, however, as in other cases where he differs from the generally received opinions on any branch of his subject, Mr. Mahaffy shows no undue desire to fetter the judgment of his readers. He states with the utmost candour the points on which other critics are at variance with him, and gives references to the authors by whom the question is best discussed. It is not easy to overrate the value of Mr. Mahaffy's work regarded as a book of reference. He gives a list of the chief MSS. of each author and an estimate of their relative value. He notices the most important editions and translations, and, in the case of the poets, gives some account of the various modern imitations of their works. His wide acquaintance with modern literature enables him to relieve the dulness which is at times unavoidable in a work of this character by happy illustrations and apt comparisons, though his taste for parallels sometimes leads him into extravagance—as, for instance, when he compares the schools of Isocrates and Plato respectively to Oxford and Cambridge, a resemblance which can, we think, exist only in the fancy of its discoverer. The analogy suggested between the parabasis of the old comedy and the topical song of modern burlesque is very happy in its completeness, though it is too obvious to be altogether new; and there is some truth in the parallel drawn between the Satyric drama and Christmas pantomime. The position of the Satyric play in a tetralogy might, however, have been expressed in English without the use of so barbarous a word as "afterlude." On one occasion Mr. Mahaffy is betrayed by a too sweeping generalization into a statement ludicrously suggestive of his nationality. In speaking of the strong influence exercised by the drama upon literature at large, he says that "even the legal oratory of the day assumed the dramatic tone, and the orator composed his attack or defence in the character of the client who spoke it." Seeing that the plaintiff or defendant uttered in person the speech written for him, it is difficult to perceive in what other character the orator could compose it. But we may here leave the thankless task of pointing out the defects in what is, on the whole, a very masterly work. The sense of incompleteness which is here and there felt arises necessarily from the limitations which Mr. Mahaffy has imposed upon himself out of regard for the special needs of "younger students," and from more general considerations of the brevity of human life. From his concluding sentence we gather, though not very distinctly, that it is his intention in another work to deal with the history of Alexandrine literature, which he has here left unnoticed. We hope that our conjecture is correct. The subject is one of great interest, though it has been dwarfed by comparison with the far greater glories of classical Greek. The task has never yet been satisfactorily approached, and its execution need not be cramped by those considerations which have so seriously lessened the interest of the present work.

SOLDIERS OF THE VICTORIAN AGE.*

"THE reign of Queen Victoria," Mr. Low observes in his preface, "will be known in our history as perhaps the most remarkable in British annals. It is pre-eminently so as regards our men of science; and scarcely in a less degree is the Victorian age famous for its philosophers, painters, men of letters, and orators. As regards our sailors, it is only because our naval supremacy is unquestioned, and hostile fleets in time of war avoid an encounter with ours on the seas, that no heroes, like the mighty seamen of the past, have immortalized themselves." No doubt, if there has been no Trafalgar in these latter days, that is not the fault of the sailors of the pre-eminent Victorian age, but of the hostile nations, especially the Zulus and the Afghans, who avoid encounter with us on the sea. Mr. Low has

* *Soldiers of the Victorian Age.* By Charles Rathbone Low, I.N. 2 vols. Chapman & Hall, Limited. 1880.

omitted to mention the most pre-eminent feature about the Victorian age—that it has come after every other age up to the present time. But not only is this a pre-eminent age; "without undue glorification we may express a doubt whether any other European nation could, with our system of voluntary enlistment, and the paucity of our land forces, have effected such a marvellous series of conquests." Mr. Low might have added a doubt whether any other nation, with our Horse Guards, would have done so well, and it is a fair question also whether other nations would get on as well as we do with our London fog.

From these extracts it will be seen that Mr. Low's sense of historical perspective is not very keen, but it is only fair to add that the book is much better than the preface. It consists of a series of short biographical notices of different British officers, some of which have been written for the military magazines, but most of which now appear for the first time. They have been carefully prepared, and appear very correct as to facts, although Mr. Low has not always had access to the best information, and the criticism is sometimes not quite so pertinent or valuable as the statements of events. Indeed we know of no other book or books which would furnish so much information about a number of officers, of varying distinction certainly, but about whom the public, and especially military readers, are likely to feel interest. But, as we have said, the work is more valuable as a repertory of facts than for the critical power displayed. Thus, in the memoir of Lord Chelmsford we are told that "Captain Thesiger was not so fortunate as to participate in the battles of the Alma and Inkerman, and did not arrive in the Crimea until . . . the siege . . . was approaching to a conclusion. For his services he received the Crimean medal and clasps for Sebastopol, the Turkish and Sardinian medals, and the fifth class of the Medjidie." Possibly Mr. Low may intend irony here, for the granting of these Turkish and Sardinian decorations wholesale to our army was a scandalous thing. But, if so, the sarcasm is concealed. Again, "On arriving at Bombay he joined the 95th Regiment in the field, but was only in time to be present at a small affair. . . . On the termination of hostilities he received the brevet of Colonel." In the Abyssinian war Colonel Thesiger served as chief of the staff to Sir Robert Napier, and throughout "was the *alter ego* of the Commander-in-Chief. Where Sir Robert Napier was not, there his chief of the staff was sure to be present as his representative. And though among his generals of division and brigadiers were such men as Stavely, Merewether, and Field, yet the subject of this memoir was regarded as the 'right hand man of his chief.'" So one might say that, although such men as the senior major and the junior major were present with a regiment, the adjutant was regarded as the right hand man of the colonel. As Adjutant-General in India, "firm but conciliatory, courteous and kind, but dignified, he was beloved by all who came in contact with him, while he earned their respect by the exhibition of such soldierly qualities as courage and calmness in the presence of danger." The description of the late Adjutant-General in India is not at all too highly coloured. But what room, in the performance of the peaceful duties of the Adjutant-General's office at Simla or Calcutta, was afforded for the exhibition of courage and calmness, and how the danger became present, is not explained. Of the battle of Ulundi Mr. Low says:—"But the enemy could not long face the terrible fire poured into them at a range of sixty yards; and, after a display of heroism that would not have discredited veteran disciplined infantry, about 9.30 they wavered"; a ludicrously inappropriate way of describing the desperate bravery of the Zulus. It would be more just to say, whenever any disciplined infantry, whether English or other, behaves exceptionally well, that their conduct would not have disgraced a Zulu. To return, however, to the subject of this memoir, we are somewhat surprised to find Mr. Low presently saying that, "in thus sacrificing the fruits of a victory won by the expenditure of so much time and money, Lord Chelmsford, we think, has forfeited all claim to the title of a great soldier; and it is hard to see how his panegyrists can defend an act displaying such timidity and want of judgment." There is something strangely absurd in this sentence, coming as it does from a writer who has constituted himself Lord Chelmsford's panegyrist-in-chief, and then, having "cracked him up" throughout the memoir in language appropriate to the deeds of a Wellington, suddenly lets him down again, taking up the cudgels against his "panegyrists." Sometimes, too, the events dragged in have no very marked bearing on the matter in hand; as where we are told that the subject of this notice thence "proceeded to Maritzburg, the capital of Natal, where his lordship received an ovation, the people carrying him on their shoulders out of his postchaise to his hotel, where the mayor read him an address of congratulation, to which Lord Chelmsford replied, expressing his thanks to the colonists for their sympathy and confidence throughout the trying time through which he had passed." A good many other people also had passed through a trying time; but the biographer has unaccountably forgotten, while recording this interesting anecdote, to tell us what his lordship had for breakfast on the occasion. Again, "though public opinion in the press, in society, and in the army, was much divided as to the generalship displayed by Lord Chelmsford, every one was agreed that he was actuated by a determination to do his best without regard to personal convenience, and that he never spared himself in the public service." We have never before heard of this division of opinion, and it is curious praise of a man to say that he was not one who did not do his best.

The book, however, is a perfect magazine of interesting facts available for the future compiler of military history; and it is not surprising that in a big work of this sort about a great many different people and events, the facts, or Mr. Low's interpretation of them, should not always be accurate. Thus, in reference to Outram's reinstatement at Baroda, after his battle with the Bombay Government on the famous bribery case, Mr. Low says that the Court of Directors asked the Bombay Government to reinstate him. It was, however, to the supreme Government of India that the Court's appeal was made, and it was Lord Dalhousie, and not the Bombay Government, who sent Outram back in triumph to Baroda. When Outram was transferred from Aden to Lucknow, Mr. Low says it was done by Lord Dalhousie, "who knew Outram's value, and had made him one of his honorary aide-de-camps"; which is as if the Queen were to reward Lord Beaconsfield or Mr. Gladstone by making him a C.B. Speaking of the action of Mohumra, in the Persian war, Mr. Low quotes with approval Havelock's remark that the "works were formidable; but in 3½ hours they were so battered by our war-ships that the enemy abandoned them in haste, suffering great loss." They were not, therefore, really formidable, or they would not have been so easily battered by a few old sloops of the Indian navy of obsolete pattern and armament. With reference to Outram's appointment to the force which relieved Lucknow, Mr. Low terms it "a supersession of Havelock, his former friend and comrade," adding "that it was not in intended that Havelock, after gaining nine victories, should be actually superseded." But it was certainly intended that Outram should take charge of the united troops collecting at Cawnpore. Havelock—some of whose nine victories, by the way, were mere bloodless demonstrations—arriving first on the scene, took over command from Neill, his junior officer, just as Outram, who had shortly before been in command at the head of these very troops in Persia, took over command in turn from Havelock when he got to the front. It is a misnomer to talk of supersession in such cases. As well say that Sir Colin Campbell superseded Outram when he came on the scene later on with a still larger force.

The memoir of Lord Napier strikes us as one of the best, because Mr. Low appreciates properly the qualities which have brought about that distinguished officer's success—the combination of patient care and forethought in arranging plans of an operation in the first instance, with brilliant dash in execution; but even here the commentary is not always felicitous. For example:—"Meanwhile Napier's promotion had been going on steadily, and with a share of good fortune. He was gazetted first lieutenant on the 28th September, 1827, and his commission as captain bore date 25th January, 1841." Steady the promotion certainly was, if slowness and steadiness are synonymous; but what good fortune there is in not getting your company until after fifteen years' service is not apparent. Of the first day of Ferozshuhr, Mr. Low says that "the British infantry flung itself with heroic devotion against the Sikh entrenchments." A part of the British infantry unfortunately did nothing of the sort; hence the indecisive result of that day. And when it is added that "Captain Napier was honourably mentioned in despatches, and received a medal with two clasps, and the brevet rank of Major for his services," a person ignorant of Mr. Low's way of dragging in the irrelevant might suppose that medals and clasps were given with discrimination, and that a brevet majority was a very great distinction. He is evidently unaware of the very remarkable part played by the subject of his memoir on that critical day, and the inadequate recognition it obtained. However, with all its faults, this is still a very useful and, in many parts, interesting book.

PAYNE'S LECTURES ON EDUCATION.*

THE late Mr. Payne gave the best part of his life to enforcing, by precept and example, a truth which ought to be elementary; which in the principal countries of the Continent is recognized as elementary, and acted on with excellent results; but which in England has only just attained recognition, and is still for the most part ignored in our chief seats of learning. This truth is that there is such a thing as an art of education. It has not been neglected for want of being before the world. Socrates, who discovered that there was a science of politics, did not overlook the science and art which are concerned with making good citizens. Plato and Aristotle, each in his own way, endeavoured to work out the pregnant hints of Socrates. In our own land Milton testified his belief that the training of human beings is a weighty and difficult matter, "not a bow for every man to shoot in that counts himself a teacher." Ascham before him, Locke after him, in our own day Mr. Herbert Spencer, many others at divers times and in divers ways, have insisted on the importance of the education of children being conducted, not haphazard, but in a systematic and intelligent manner. Yet in the vast majority of our schools, and, it is to be feared, in the vast majority of our homes, the development of human faculties and formation of human character has to this day been treated as an undertaking so trifling or so easy as to require for its successful performance the application of very little intelligence and no method whatever. Boys and girls are not puppets that will dance as you pull the strings, but men and women in little; yet their parents and pastors and

* *Lectures on the Science and Art of Education: with other Lectures and Essays.* By the late Joseph Payne. Edited by his Son, Joseph Frank Payne, M.D. With an Introduction by the Rev. R. H. Quick. London: Longmans & Co. 1880.

masters go on acting as if they thought with Guildenstern that man is easier to play on than a pipe. Honourable exceptions there have always been; and now, thanks to the labours of Joseph Payne and others like him, it seems within the reach of reasonable hope that these examples may spread and become the rule. And then, if we look back to the work of those who cleared the ground and find in it some touch of over-heated denunciation, or over-weening promise, or dogged iteration of things that now appear obvious, let us remember that they bore the burden and heat of the day in evil times, and that without enthusiasm and insistence their work would not have come to the harvest at all. A man who is afraid of repeating himself, or of seeming disagreeable to respectable persons and institutions, will never make much impression on the inertia of established routine. Mr. Payne was completely free from both these fears, and his work took root. This volume is made up of a number of occasional discourses and papers, which he presumably would have disposed otherwise if he had arranged them for publication himself. As they stand they form a series of landmarks in an active life, and show how constantly he was occupied in working out and enforcing the application of a few leading ideas.

The first and great axiom of the science of education, as conceived by Mr. Payne, is a paradox; he learnt it, as he himself tells us, from Jacotot, but realized it with a strength and vitality that made it his own. It is that a teacher's business is not to teach his pupil, but to lead him to teach himself. "Learning is self-teaching . . . the mental act by which knowledge is acquired is the pupil's, not the teacher's." The mere driving of words and facts into a pupil's memory "is no more instruction than heaping bricks and stones together is building a house." The true instructor commands the materials of knowledge as Amphion did those of building; he does not lay his own hands on them, but under his bidding they "move together to the place where they are wanted, and grow into the form of a harmonious fabric." Hence another paradox, that the teacher's highest success is to make himself useless to his pupils. It is worth observing that, just as we noted of the general conception of a science of education, this discovery is ancient in conception though recent in application to practice. The famous questioning method of Socrates had no other idea than this at its root; he went on the principle that only that knowledge is vital which a man arrives at by his own thought. And by his own description of the process he showed that he clearly apprehended the true theory of it. No modern could be more distinct on the point that real teaching is not a bare putting in from without, but a drawing out and developing from within. Unfortunately, the right way of doing most things is harder, till one has learnt it, than the wrong one; and the construction of knowledge by drawing out thought from within is an affair of skill and patience. For it is yet another paradox, but true, that in education, as in government, the hardest thing of all is to know when not to meddle. It is much easier to teach, or seem to teach, children by stuffing them with words to be reproduced to order than to make them teach themselves and acquire a grasp of things; and the temptations of the easier way have prevailed, with results which may be read in various public documents. One question, however, is apt to rise in the mind which deserves a little attention, though we do not find it noticed in this book. Do not the reformers prove too much? If the common method or want of method is as bad as they say, how is it that any tolerable results are produced? A certain number of pupils, including the reformers themselves, have under the old system come out good scholars, accomplished men, and capable of independent thinking. Can the tree be so faulty if its best fruit is so good? On general grounds it may be answered that this is the old fallacy of *post hoc, propter hoc*; bad workmanship is not shown to be good by its not actually spoiling good stuff. Again, a system is to be judged not by extreme cases on either side, but by the average results. In the case of English education few persons who have not paid special attention to the subject know how poor the average result is. But a more specific explanation is given by Mr. Payne's leading principle. If learning is really self-teaching, we can see not only why and how the current routine of school work is bad, but why and how the consequent mischief is limited. In one way and another we all begin teaching ourselves almost as soon as we are born, and never leave off during our lives. What we learn depends on a great many circumstances, our desire for the particular kind of knowledge being, after years of discretion, one of the most material. Now take the case of the human being at the age of schooling. If he is intelligent, and becomes interested in the matters which his masters profess to teach, he will proceed to teach himself, and a perverse routine cannot altogether prevent him from learning, though it may perhaps hinder him considerably. No doubt there will be waste of time and energy; though it must be remembered that much of the apparent waste of early life, whether in book-learning or in other things, in truth repays its cost with interest in experience and the faculty of handling knowledge and affairs. Hardly any instruction can be so bad, either in form or in matter, but that an active mind can make it a real instrument of education to itself. Thus the better sort suffer by comparison but little; if they are once set going on the road of taking care of themselves, they may do well enough even under arrangements which are very defective. It is to be remembered, too, that in the years most important for learning—say from twelve to twenty—the learner will meet with many teachers; and as things are now, or even as they were twenty years ago, it is a strange chance if at least one or two of them have not a mind above routine, and some spark of the Socratic faculty of quickening and opening a learner's thought. The first-class men, on the whole, are not those who need pity; perhaps that is why they are mostly rather indifferent to the evil. It is the intellects of the middling and duller sort that get starved and stunted by unintelligent school-work. This is a thing calling for no demonstration; it is writ large in the whole temper and fashion of the British middle classes. And, indeed, in our great schools and universities the case is likely enough to happen that a young man of no less than average wits, finding no strong liking in himself to the appointed studies, nor encouragement from those who should keep him to them, betakes himself to such things as he does find that he can more effectually and pleasantly, in our author's phrase, teach himself—which are cricket, rowing, and the whole genus of athletics. Just now there is a great cry against athletics, as if they were the cause of idleness, and the neglect of other things were not rather a symptom of deeper shortcomings; whereas parents and tutors should for the present be only too thankful that, for want of anything better, the activity and interest of athletics keeps young men from things much worse.

But we must return to Mr. Payne's own application of his idea. He exemplifies the right and the wrong way of teaching by a lesson in mechanics. The routine teacher begins by giving out a definition of a machine in abstract terms, and is surprised that his class cannot understand it. The teacher who knows his art begins with a working model of some simple machine, tells the class at first merely what it is for, lets them see it at work and work it for themselves, makes them note the results by weight and measure, introduces technical terms only as and when the facts themselves are known by direct experience, shows the effect of varying the conditions, and finally dismisses the children with an invitation to devise improvements on the machine if they can, and bring the results next time. One would say offhand that not much invention is to be got out of an average school-class; but Mr. Payne assures us, as a fact within his own experience, that there is a good deal, if the teacher will only look for it and encourage it. All the common methods of teaching are directed to make the learner merely repeat what he has been told; the method advocated by Mr. Payne aims at making him repeat as little as possible, but acquire ideas and learn to put his own activity into the use of them. In the technical language of Cambridge examinations, Mr. Payne's ideal is to reduce book-work, as compared with riders and problems, as nearly as may be to a vanishing quantity. The method can be carried out even in the first elements. Jacotot, and Mr. Payne after him, would have reading taught quite otherwise than by spelling-books. Learning the letters separately is now pretty well exploded; but Jacotot and Payne go much beyond even the improved syllabic method of modern reading-books. They plunge at once into a real sentence, teach the individual words—not syllables—by sight, as unanalysed wholes in the first instance; comparison, analysis, and knowledge of the power of individual letters, come gradually as the sentence is mastered. Any reader who is acquainted with Mr. Prendergast's "Masterly Series" will at once perceive that his plan of learning foreign languages is framed (quite independently, so far as we know) on the same model. All along the line it is the war of things against words, the same war that is being fought out in the higher scholarship at the Universities, and in which a signal victory has been gained by the reform of the Classical Tripos at Cambridge. And in the end things must win; but before this can be we must organize victory by teaching the teachers. "Mechanical drill and cram," as one of these lectures laments, are still supreme in the codes and instructions of the Education Department. Great interest attaches, therefore, to what Mr. Payne had to tell of his success in this undertaking. At the end of a lecture on "The Science and Art of Education" given at the College of Preceptors in 1874, we find some striking extracts from the statements of teachers who had followed Mr. Payne's lectures. One said: "Before attending these lectures, my aim was that my pupils should gain a certain amount of knowledge. I now see how far more important is the exercise of these powers by which knowledge is gained. I am therefore trying to make them think for themselves . . . I now try to adopt my plan to the pupil, not the pupil to my plan." Another said: "What you have done for me, I endeavour to do for my pupils. I make them correct their own errors; indeed, do their own work as much as possible. Since you have been teaching me, my pupils have progressed in mental development as they have never done in all the years I have been teaching." Obviously these teachers had learnt to some purpose, and Mr. Payne might well say that his labours had not ended in mere talk.

That pupil had seized the root of the matter who learnt from Mr. Payne that not "a certain amount of knowledge," but "the exercise of those powers by which knowledge is gained," is the really important thing in education. In the light of this principle Mr. Payne viewed the controversy between science and classics. What he says about science in his lecture on "The Curriculum of Modern Education" may perhaps be summed up thus:—"Teach science by all means—that is, train the mind to scientific method. But mere verbal teaching of scientific facts out of books is as worthless as any other merely verbal teaching; and remember that you cannot teach all the sciences. If you ask specialists which science is to be taught, each will name his own, and your programme will be beyond human powers." It appears that Mr. Payne would practically have advised the introduction into school teaching of

elementary physics, and at a later stage chemistry or physiology. We are disposed to think that he somewhat underrates the importance of clear physical ideas, seeing that nine-tenths of the nonsense that flourishes in the world trades chiefly on the absence of them; and, for the sake of its immediate bearing on health and the conduct of life, we should decidedly put physiology before chemistry, except what little chemistry the elements of physiology involve. These, however, are trifling differences as compared with the main question of method. As to classics and literature, Mr. Payne points out, as Dr. Johnson had done, and also Locke before him, that one of the most essential kinds of knowledge is the knowledge of human nature; and that this is what we find in the best books. Then the eminence and necessity of Latin as an instrument of the higher education consist, apart from the merits of Latin literature in itself, in Latin being the common meeting-ground of the civilized world. It is the key, not to one city or country, but, as Mr. Payne truly says, to the commonwealth of letters. Moreover, the scholar may now say to the man of science that the study of language is itself a science. Modern philology has informed it with new life and made it progressive. On the whole, Mr. Payne's judgment on the claims of language and natural science is a remarkably fair and lucid one.

Space has not allowed us to give any specimens of Mr. Payne's writing; it is always good and apt, but we fancy that in the pieces now collected it was a little under restraint. Anyhow, there is nothing in this volume that will compare for freedom and vigour with the article on Eton published in the *British Quarterly Review* twelve years ago, which Etonians may now read with tolerable equanimity, so many things being amended or in a speedy way so to be. It is a strong and brilliant piece of caustic criticism, and at the time was open to no reply but Mr. Pepys's—"A devilish saying, but true."

THE UNDISCOVERED COUNTRY.*

ENGLISHMEN do not very often read the critical part of American reviews, and it is perhaps fortunate for Mr Howells's reputation that they do not. It is not unusual to find him spoken of in these reviews as a sort of compound of Thackeray and Landor; a novelist possessed of the most remarkable insight into character and power of drawing it, and, as they would themselves say, a stylist of unsurpassed originality and force. We have seen it stated in so many words that Mr. Howells yields to no one living among those who write the English language. This silly provincialism might, if it anticipated an actual acquaintance with the author's works, not a little injure their chances. Fortunately, however, some of Mr. Howells's work, notably *A Foregone Conclusion*, came over to England early enough to get the start of his injudicious trumpeters. If anybody claims for him the position of the best novelist of America, and of a writer who, with the heavy drawbacks of his dialect, still deserves a good place among his English contemporaries, the claim certainly cannot be disputed. Mr. Howells is of the class of American writers whom Mr. Henry James also represents. But he has perhaps the advantage of Mr. James in a less dogged clinging to European themes, in a greater range and freshness of subject, and in the absence of all but a very faint flavour of mannerism. On the whole, he is a very pleasant author to read, though even in his case we wish we could be indulged with an English edition of his works relieved of the ugliness of orthography and of phrase which disfigure the book before us. "Traveled" and "quarreled," "honor" and "labor," "forever" in one word, and "could n't" in two, give the teeth of the reader an earnest of that setting-on-edge which the spelling reformers reserve for him in the good time coming; and when he has accustomed himself to these, "did not have" comes to upset his restored equanimity. This last is perhaps at once the ugliest and the most inexplicable of Americanisms. For we have not observed that even Americans say "did not be."

However, *The Undiscovered Country* is a good enough book to enable the reader to go on reading it, despite the *amari aliquid* which is but too frequently presented to him. A good many novels, English as well as American, have dealt with Spiritualism, and it cannot be said that many have dealt with it successfully. Mr. Howells has taken a course which, if not exactly novel, does not lack a certain amount of freshness. He has made his Spiritualist hero a singular compound of perfect sincerity and unblushing quackery. Dr. Boynton is a fervent believer in Spiritualism—or, rather, an ardent hankerer after fervent belief in it. But, not being exactly an idiot, he has observed the quackery which generally prevails on the subject, and has drawn the bright conclusion that a certain amount of slipperiness is inseparable from the Mediumistic temperament. He accordingly mixes himself up with some very doubtful people, whom he allows, in his own words, to "assist the Spirits." The Spirits are of course assisted to their hearts' content, and when Dr. Boynton finds out how far the assistance has gone he is in a paroxysm of rage, grief, and despair, being indeed, as his confederate justly calls him, "a new sort of fool." He is always going through these alternations of eager belief in having found the clue, and of frantic disappointment when it fails him. Unluckily he himself is not the only person who suffers from his folly. He has a daughter, a beautiful girl, of the name of Egeria, with light hair of a "plastic massiveness." It should be observed that Mr. Howells does not often fall into the jargon which a certain class of American writers affect, but every now and then he is caught. "Plastic massiveness" is to us a vile phrase. Why not massive plasticity or mastic ———? but it is Mr. Howells's fault that we are tempted to be flippant. Egeria Boynton is an unhappy young woman, not very brilliant, who is passionately fond of her father, and deeply disgusted at the charlatanism which she is forced into partaking; but who nevertheless, owing to filial affection and a nervous temperament, allows herself to be mesmerized and materialized or immaterialized—we really cannot undertake to use the jargon correctly—and thus to bamboozle others, to ruin her own health, and to confirm her father in his self-deluding folly. The humbug is somewhat brutally exposed in Boston by a certain Edward Ford, who is in a way the hero of the book. This Ford exhibits curiously the odd tendency which certain American novelists have to show off with a sort of pride the most disagreeable types of their countrymen. Ford reminds the reader to some extent of Newman in Mr. James's *American*, but he is much more detestable. His conversation may be said to be chiefly distinguished by a kind of surly brutality which his admiring companions at boarding-houses and elsewhere take for genius, and which he himself seems to think *echt-Amerikanisch*, and a fine contrast to the habits and behaviour of those of his countrymen who are always going to Europe and talking of Europe. Wishing to expose the Spiritualists, he grasps the medium's hand—it happens to be Egeria's, and he is penitent enough, but, as Dr. Boynton points out to him, it must in any case have been a woman's, the other confederate being a certain Mrs. Le Roy—so roughly that a ring is cut into the bone, and the unhappy girl faints with the agony. It is not to be supposed that Mr. Howells exactly sets up this brute for admiration, but he has the *beau rôle* almost all through the story, he is decorated with the novelist's highest mark of favour, the hand of the beautiful young woman, and, generally speaking, he has sheep and not goat written against him by his creator. Mr. Howells may very justly say that he does not write for English readers and is not responsible for any bad effects he may produce on them. But he really does produce very bad effects. The Pharisaic feeling with which every English reader will thank the goodness and the grace which have prevented his own country from producing, except as monsters and abnormalities, such creatures as this Ford, and which have provided in his own country other creatures who would probably kick them if they did exist and behaved according to pattern—this Pharisaic feeling, we say, is obviously improper and unhealthy, and a novelist who produces it is responsible for his acts.

A curious part of the book, not hitherto noticed, is that which represents the Boyntons' residence in a Shaker village. Mr. Howells evidently has a kindness for these curious people, and he has represented their colony at Vardley in very attractive colours. The introduction to it of the Spiritualist and his daughter is preceded by a chapter or two which show the very great narrative power which the author when he is at his best, possesses. Disgusted by the Boston exposure, Boynton has determined to quit the town and go to his friends—that vague term meaning in the present instance the father of his dead wife, who is the only connexion he has, and with whom he has quarrelled. Sufficient money for the journey is furnished by a sympathizing acquaintance, and a start is made. But the half-insane Boynton goes wool-gathering at a junction after some Shakers whom he has overheard talking about Spiritualism, and at the last moment hurries his daughter into the wrong train, their money and luggage having been previously put into the right one. Thus at nightfall they are turned out moneyless at a country station. A village shopkeeper refuses to lend any money on the ring which is the only valuable they possess, and the American horror of tramps (vividly illustrated, by the way, in this book, and instructive to admirers of the Republic) refuses them shelter everywhere. They hear of a Shaker village, where general hospitality is given, some miles off, and start to walk to it. But Egeria has been completely knocked up by excitement and misery of all kinds; bad weather comes on, and they are only too glad to find a wayside schoolhouse which has been left unlocked and with a fire in it. Next morning the "school ma'am" appears, and is charitable after her powers. They continue their walk; but Egeria, unnoticed by her father, who is in one of his exalted moods, becomes seriously ill. They rest in a tavern which is a haunt of evil characters, and where they are taken for prison-breakers and the police set upon them. At last (the girl in a fever and the father in not more than his usual state of lightheadedness) they reach the Shaker colony and things mend. The whole of this journey, of the events of which a bare outline has just been given, is drawn by Mr. Howells with great power; the peculiar effect of nightmare helplessness which the course of things causes in Egeria being reproduced, as the reader peruses it, with singular vividness. So, too, the Shakers are excellently portrayed. These prosperous and not unamiable fanatics have usually made their appearance before English readers in such very bad company that they have been somewhat discredited thereby. It may be well therefore to say at once that Mr. Howells's Shakers (and, we believe, the Shakers of fact, as far as their American villages are concerned) differ very little from their ancestors the English Quakers, except in discountenancing marriage, not absolutely forbidding it save in those "gathered in." In their quaint phraseology and dress, in their singular worldly prosperity, and in their large charity to outsiders, they

* *The Undiscovered Country.* By W. D. Howells. London: Sampson Low & Co. 1880.

are almost duplicates of the older Quakers after the first fanaticism of Fox's day had settled down, and before they had taken to exclusive money-getting and sectarian politics. Nor are the odd religious observances which Mr. Howells describes much more out of the way than the proceedings of a Quaker meeting in old days.

Shakerism and Spiritualism have, it is said, a certain community of origin, and hence Boynton's anxiety for communion with the colony at Vardley. The association has a tragical end. He endeavours, when Egeria has recovered, to produce spiritualistic, or rather at first mesmeric, effects with her aid before the Shakers in meeting. But the girl's restoration to health has strengthened at once her nervous system and her moral fibre, and she either refuses or is unable to make herself the instrument of his will as of old. Thence a catastrophe. It is to be observed, however, that the beginning and end of the book are scarcely equal in point of interest or of merit to the middle. The description of a *séance* in the early chapters is good, but not very good. The end wanders off into theological discussions, and the story comes slowly and a little tamely to its foregone conclusion. The book will make devout Spiritualists very angry; it is not wholly orthodox in tone, so that it will not conciliate those who oppose Spiritualism from the theological side; and it is at the same time far from being a contribution to the purely scientific treatment of the question. Of course these facts have nothing to do with its goodness as a novel; yet Mr. Howells has not entirely saved it from the appearance of being a novel with a purpose—that is to say, a bastard work of art. *The Undiscovered Country* is by no means its author's best book; but it contains in the journey already described a fragment of his best work, and is worth reading if only for this.

DEL MAR'S HISTORY OF THE PRECIOUS METALS.*

As a member of the United States Monetary Commission of 1876, it fell to the part of Mr. Alexander Del Mar to prepare certain reports and minutes relating to the California and Nevada mines, collating with them returns from American Ministers in foreign countries, and from other sources bearing upon the production of the precious metals. In the course of this labour many matters both of evidence and reasoning came within his reach, which the limits and the scope of the Commission did not allow him to embody in his official reports. Impressed with their importance, he determined to verify and extend the information thus acquired by means of a visit to California, where he has since resided. With these results he was induced to combine a general history of the precious metals, judging it of great advantage to write in a mining country within sight of the mines, and in the midst of a mining community. The practical gain thus insured he found means to supplement by the aid of such works of a general kind as the libraries of the Pacific Coast might supply, in the absence of books of a more technical character. The references with which his work abounds, as well as the list of authorities prefixed to it—among which, however, we miss with surprise the names of Mr. Goschen and Sir John Lubbock—show that he has had no lack of material for the execution of his design. Whilst freely acknowledging his debt to the excellent work of Mr. William Jacob, hitherto the chief if not sole source of information upon the history of the precious metals, he justly finds in the important events which have taken place in the meantime—the discovery of the great Californian and Australian placers, the opening of the highly productive mines of Nevada, and the extension of the European money system to Japan and other countries — a sufficient apology for the attempt to cover once more the same ground. Mr. Jacob's history, moreover, failed to mark the significant agency of conquest and slavery in the production of gold and silver, and consequently yielded no data for computing the effects of mining upon a strictly commercial basis, which only began with the era of free mining in 1849. It contained no sound calculation of the world's stock of precious metals in ancient and mediæval times, whereas the purchasing power of all future yields must be largely affected by the existing accumulation of stock acquired by the original owners, by conquest or slavery, with little or no cost. It omitted all mention of the very considerable movement from Japan to Europe during the sixteenth and seventeenth centuries, and failed to rate the importance of nearly two hundred millions of gold from the Brazilian placers. It gave no connected history—indeed but little mention—of the ratio of value between gold and silver, and omitted all reference to the devastation of the earth and other social ills entailed upon mining countries by the search for those much-prized metals.

The list of these deficiencies in the work of his predecessor gives a very fair clue to the contents and scope of Mr. Del Mar's undertaking. After a rapid but fairly exhaustive sketch of the early use of gold and silver, the chief sources of these metals, their introduction as coined money, and their application to the arts, he points to the influence of this universal thirst upon the political fortunes of the world, with the evil concomitants of conquest and slavery. Owing to these disturbing forces there is, he argues, from the first no possibility of reducing the value of these acquisitions to a basis of strict cost. The same vices follow the fresh development of the search for gold from the period of the opening-up of the New World, which our author traces with great fulness of detail and much breadth of view. The savageries of Cortes, Pizarro, Balboa, or Ayora, emulated at no great distance by adventurers of British blood, hardly needed re-telling, save for the statistics they incidentally afford in illustration of the wealth accumulated, the tracts of land brought under mining operations, and the economic as well as moral considerations proper to the action of conquest and slavery.

In his chapter on the world's stock of the precious metals, our author shows the most conspicuous advance beyond the work of his predecessor, both in the larger mass of facts he has brought under view, and the more scientific handling of them. Jacob's estimate of the amount of bullion under the Roman Empire was vitiated as well by defective notions of the Roman method of notation, as by misconstruction of the language of the classic historians. If we are to believe Suetonius to have stated the amount of bullion then in circulation as equivalent (in sesterces) to 322,916,000*l.*, we arrive at a rate of gold or silver currency as high as six pounds sterling per head of population, taking Merivale's calculation of 60,000,000 souls for all Europe at this period. Even after the opening of Potosi, Europe, urges Mr. Del Mar, never showed a rate half as high as this. In setting down the existing stock at the period of the discovery of America at 34,000,000*l.* or so, he at the same time considers Mr. Jacob to be fairly near the mark. He only demurs to that writer's view of a gradual decline from a theoretical quantity so preposterous.

The minute and elaborate tables drawn up for the work before us from the most trustworthy sources trace the steadily progressive growth of the wealth of Europe from 1488 A.D. onwards, culminating at the present time with 650,000,000*l.* in coin or 1*l.* 12*s.* a head. A strange falling off between the years 1700 and 1776 is explained by the temporary decline in the supply of bullion, and the drain upon the currency of Europe, a similar relapse having been admitted by Humboldt, Jacob, Macculloch, Tooke, and other writers between the years 1808 and 1839. Naturally enough the most marked rise is seen in the period immediately following the discovery of America, the stock of coin per capita, which was 16*s.* in the year 1492, having risen by 1636 to 3*l.*—the total increment for all Europe being estimated at more than 200,000,000*l.* It is only by a rough approximation at best that we can hope to sum up the hoard of gold and silver wrung by torture and terror from the unhappy Indian races, or dug from the mines of Peru and Mexico before their gradual exhaustion set in. Of the wealth poured into Europe later on from Brazil, more trustworthy statistics are to be had. In the sixty years from the opening of the mines to the year 1756, the yield of gold, as estimated by the Abbé Raynal, was about 96,000,000*l.* The table carefully compiled by our author, after a critical sifting of the widely varying authorities, sets down 180,000,000*l.* or more as the total produce of the Brazilian placers from their discovery to the present day. From Japan he gives reasons for believing that at least a hundred millions sterling of gold were imported into Europe within the seventeenth century. Adding these figures to the 220,000,000*l.* at which the yield of California to the present time is estimated, and the 240,000,000*l.* from Australia, we get an approximation to the amount by which the wealth of Europe in specie has been augmented within the last two centuries. Not more than one-third of the existing stock is estimated to consist of silver, the demonetization of that metal in several of the leading countries of the world tending to reduce the general stock of silver coin, at the same time that the increased produce of the Nevada mines, and the quantity of silver thrown upon the market at home, tells upon the value of the metal, as the loss upon Indian exchanges has for years sadly testified. Thus far the figures adduced have reference to the amount of metal in the shape of coin. Of the quantity devoted to other purposes than money no means have been found of forming any trustworthy calculation. Mr. Jacob's estimate of 440 millions converted into articles of use and ornament, as well as of 175 millions lost by abrasion and casualties of all kinds, must be set down as largely conjectural. Nor till late years could any more exact computation be formed of the flow of specie to the East. Mr. Del Mar's chapter on this subject shows the conflict of authorities thereon, out of which he extracts the approximate figure of 772,000,000*l.* as the grand total of gold and silver exported to India and China since the year 1559, against which is to be set some 172,000,000*l.* as the net counter flow from East to West.

The ratio or relation of value between gold and silver, at all times a variable quantity, has fluctuated within the range of history to wide extremes. A fragment of Agatharcides, a Greek geographer under Ptolemy VI., Philometor, King of Egypt (B.C. 181–145), speaks of the value of silver in Arabia being tenfold that of gold. The superior value of silver to gold in ancient times has been asserted by Boeckh, and is borne out by the tribute lists of Egyptian kings. The revulsion has been traced to the opening of the silver mines of Greece and the exchange by the Phœnician traders of their exuberant metallic produce for the freights of the East. Up to this time the gold sands of the Indian mines and the rich placer and quartz mines of Arabia—the land of Midian, as Captain Burton has lately urged, having been then exceptionally rich—had accumulated a vast mass of gold with comparatively little silver. The earliest authentic measure of the ratio, derived from the cuneiform inscription at Nineveh (Khorsabad) (*circa* 708 B.C.), gives 1 gold = 13·33 silver. Herodotus, speaking of the payment of the Egyptian tribute to Darius, sets down the Persian ratio as 1 gold = 13 silver. In

* *A History of the Precious Metals, from the Earliest Times to the Present.* By Alexander Del Mar, M.E., formerly Director of the Bureau of Statistics of the United States, &c. London: Bell & Sons. 1880.

Greece, about the 4th century B.C., the rate stood at 1 gold = 14 or 15 silver, the same probably holding good throughout Levantine Europe and Asia Minor. It narrowed by degrees, until, at the time, America was discovered, it stood at about 11 throughout Europe. In England it was fixed by the Act of 22 Edw. IV. (1483) at 11·158; in North Germany, by the Lubeck Mint rule of 1463, at 11·60; in France, by the law of 1388, at 10·75; in Spain, by the law of 1483, at 11·675; in Italy it stood at about 10·5. Whilst for centuries before the discovery of America the Western ratio was narrowing from about 1·14 to 1·11, it widened in the East, under economic conditions traced by our author, from about 1·55 to 1·6 or 1·7, the two, however, reciprocally modifying each other as the intercourse between Europe and Asia became more intimate, until in the early part of the present century they came practically to the same level. The subsequent fluctuations, though wide enough to cause grave fiscal embarrassments, and to give scope for an indefinite amount of speculative discussion among financiers and political economists, have at no time come near the tremendous differences of yore. Mr. Del Mar's tables and his able historical analysis give the reader a clue to the intricacies of this important section of monetary philosophy, pointing him to the most signal landmarks in the record of the money market all over the world, and the authorities best qualified to deal with that most occult class of influences. Two powerful agencies in particular, which came into play together about the beginning of the last century, are to be taken into account in estimating the amount of change in the value of the precious metals in addition to the direct influence of production. These are, firstly, the extensive substitution of bank paper, and afterwards Government paper, for coin; and secondly, alterations of the metallic basis, or changes of standard, that in England taking place nominally in 1717. Our author points out how England, by becoming and remaining the banking centre of the world, has verified the sagacious prediction of Newton by making profit out of every exchange of bullion between other countries. For the world at large he sees the best policy to counteract this effect in adopting the single silver standard. How at the same time the silver standard is to be kept up, whilst the legal supports of the existing ratio throughout Europe are in process of being knocked away, and the threatened flood from Nevada seems likely to be swollen by the opening of the new Comstock adit, is a financial problem we would gladly have seen him handle with greater definiteness. He is indeed satisfied, from the investigations undertaken by him in connexion with the United States Monetary Commission, that the world's normal product of silver is not materially on the increase nor the normal flow of silver to India diminishing. The value of the precious metals, he concludes, both as it exists and evidently tends in time to come, has its basis substantially in the conflict of the mint laws of nations, and in the natural operations of domestic mintage and international exchange.

THE NEW NATION.*

We must confess that we are quite unable to do Mr. Morris the justice which he demands. His big work is so complete and logical a whole, in his own opinion, that he protests against any skipping or any casual peeping at isolated passages on the part of readers and reviewers. A man may dip into Homer or Joe Miller, Shakspeare or Dickens, at any chance page, and be sure of finding something which he can understand. But an accidental plunge into either of Mr. Morris's five volumes will probably yield precisely the opposite result. The reader will be almost sure to find something which he cannot understand. After struggling for a time hither and thither in Mr. Morris's whirlpool of intellectual confusion, he will probably make a desperate clutch at Vol. I. and turn to p. 1, where he will find that a danger-signal has been considerately erected by the author. "Notice"—observes Mr. Morris, "No part of this book should be read until all that precedes that part has been carefully perused, for the arrangement is such that it can only be thoroughly understood by those who read it straight through." The day of a reviewer only contains twenty-four hours; but, if it contained forty-eight, he might be excused for shrinking from reading every word of a book which is mainly made up of long slices of vocabulary, relieved here and there by intermittent passages of unadulterated fun. The third and fourth volumes are entirely filled with extracts from the dictionaries of "forty languages and several hundred dialects," the object of which is to "prove"—a word which is constantly on Mr. Morris's pen—that every bad word in every language is derived from the name of one of the generations of Shem. The tenth and eleventh chapters of the Book of Genesis appear to be about the only portions of the Bible upon which Mr. Morris sets his seal of authenticity; the remainder of the Old Testament has been corrupted by Moses and other Shemite scoundrels. The undoubted fact that the morally and physically leprous race of Shem has poisoned the whole world is proved by the etymological testimony of "the forty languages and several hundred dialects." Thus the "Egyptian *Shemm*, venom or poison"; the "Swahili *Sumu*, poison"; the Turkish, Arabic, and Hindu "*Samm*, poisonous, baneful, infectious"; the "English *symotic*, pertaining to a morbid poison"; the "Hebrew *zmh*, or *samh*, lewdness"; the "Persian *Sam*, a disease, a swelling"; the "Polish *Dzuma*, the plague or pestilence"; and the "German *Schwamm*, a spongy excrescence on the body," to say nothing of the countless other words cited by our vocabularist, are all traceable to the disgust of the early inhabitants of the world for the vile person of the first son of Noah, "Shem, Sem, Sam, or Sm." The worst member of the whole "Shemite conspiracy," Moses, not only invented the legend of the Fall and the doctrine of original sin, but also the malicious story of Ham's impiety and Noah's curse of Canaan. It was the object of Moses to shift the natural hatred of the human race for the infamous Shem upon the shoulders of the guileless Ham. The "Irish *Ebar*, dirt"; the "Arabic *Abbar*, fleas"; the "Greek *Ubris*, *Ubreos*, *Ubrei*, or *Ybris*, *Ybreos*, *Ybrei*, rank lust, lewdness"; with many other unpleasant words in other tongues, point back to the criminality of Shem's descendant, "Heber, Eber, Aber, Abr," who was the ancestor both of Moses and Pharaoh! The English word "*Rake*, a loose, disorderly man"; the "French *Roue*, an immoral person, and the Greek *Rexis*, *Rexeos*, *Rexei*, suppuration," owe their origin to the son of Heber, "Reu, Rao, Rehu, Regu, Ragau." Raggedness and Ragoût may perhaps be traced to the same Shemite source. Mr. Morris has made it a principle never to transfer to his own vocabularies the accents which he finds in his dictionaries, while he pays an exclusive honour to every Greek noun by always adding its genitive and dative. We are surprised to learn that we owe our English words "Shrew," "Screw"—as applied to a stingy person—"Swear," "Scour," and "Scare," to one or other of the twenty-eight variations of the name of the Shemite woman, Sarah, the wife of Abraham. Sarah's son Isaac has supplied our language with the word "*Askew*, with a wry look, aside, sometimes indicating scorn or contempt," and also with the "English *Assegai*, or *Assagai*, an instrument of warfare among the Kafirs," while the evil traditions of Isaac's character surviving amongst our ancestors led the Anglo-Saxons to call deceit *Eswic*, and a hypocrite *Aeswica*. The "English *Ossuary*, a charnel-house," the "Greek *Oizuros*, *Oizura*, woeful, miserable, wretched, sorry," the "Sanskrit *Asra*, a tear," and the "Hindu *Hashr*, the resurrection," proceed from "Israel, the *alias* of Jacob."

The author of these unique volumes was the subject of an exceptional Divine intervention before he was laid in his cradle. When he was "only one hour old," the flames consumed the bed on which he was born; but the Almighty preserved the remarkable baby in order that he might live until the spring of 1880, and "complete the spinning of the threads of which this work is composed." He does not tell us where or by whom he was educated; but when he was about seventeen years old he "first formulated God," and wrote a part of this big work. He has been labouring upon it for nearly thirty-three years. "I find myself now," he says in his concluding pages, "finishing the last volume, while my wife and nine children are rejoicing that 'papa' has come to the end of his work." "My ambition," he adds, "is gratified. I have completed my task of heralding *The New Nation*, and, whether it turns out great or small, I know that I shall be considered its founder." Mr. Morris affords us no other glimpse of his biography. Perhaps we may be allowed to construct a conjectural chapter of the great man's life. At some time or other, as we are led to imagine from internal evidence supplied by his book, Mr. Morris came across the wild Anglo-Israelite theory of Mr. Hine. Moved to irritation or emulation, he determined to start a rival theory. Mr. Hine and his followers believe that the year One of the Golden Age will dawn upon the world as soon as Englishmen can be persuaded to adopt the delusion that they are not Englishmen, but are Israelites. Mr. Morris, on the contrary, has resolved to "prove" that the children of Ham are the elect people, the first-fruits of the humankind, the hope of the world, the Church of the future, or, as he prefers to call them, "the New Nation." All the evils in the earth have proceeded from "the baneful and mind-cramping influence of Shemite superstitions," and especially from Mohammedanism and Christianity. Each of those religions is composed of "a mixture of Paganism and Judaism, but the two are blended in different proportions, Christianity having the largest infusion of Paganism, and Mahometanism having the largest infusion of Judaism." "Paganism and Christianity are both idolatrous, and founded on a plurality of Gods; Judaism and Mahometanism are both violently opposed to idolatry, and worship but one God." Since both, however, are products of the corrupt Shemite spirit which has produced Judaism, Mr. Morris will have nothing to do with them. Though Mohammedanism is, on the whole, purer than Christianity, "it is poisoned, and rendered nugatory and valueless, by the false doctrine of a Devil," and also by the "equally false doctrine of Original Sin."

The regathering of the dispersed members of the body of Ham will set to rights the present disjointed world. When Ham is "liberated from the tyranny and superstition of Shem," a full development of the Hamite instincts" will "solve the social problems," will put an end to "the hysterical religion of sleek revivalists" and "the formalities of ritualistic masqueraders," and will even produce in Shemites and Japhetites "a character essentially human, but withal most loveable, courteous, generous, gentle, industrious, patient, yet noble in every sense." The great problem is, "How shall the Hamites be gathered together? How shall they know each other when they meet?" Mr. Morris fears "that there are not many Hamites left." The sanguinary Shemites "carried on the process of exterminating them when the population of the globe was small." He has discovered, however, by his study of "etymological science" the secret test by which a son or

* *The New Nation.* By John Morris. 5 vols. London: John Morris. 1880.

daughter of Ham can be infallibly detected. "To-day," he triumphantly exclaims, "no man of all the thousand million inhabitants of this earth, except myself, can put his hand on a single human being and say, 'This man is of the race of Ham!' No historian has ever recorded how they may be known. All the kings of the earth are powerless to order a single one of them to be produced. All the money in the world could not buy the secret of their identity. And yet all that holds civilization together, all that is most hopeful in humanity, is centred in them. Mystery! Mystery!" It is some comfort to know there are Hamites in England, and that they have white skins.

Before we reveal so much as we have been able to discover of the important secret, we must warn any person who is eagerly hoping that he is a son of Ham not to be deceived by his surname. Mr. Morris himself belongs to the privileged race of Canaan—the great patriarch in whom, instead of in Abraham, all the families of the earth are to be blessed. The Cornish, or Old British, surname Morris, as he has lucidly demonstrated, is derived from "Moreh," the place at which the Shemite Abraham first halted in his aggression upon the land of Canaan. Mr. Morris takes Moreh to be the name of the head of his own tribe; he was "the Canaanite" who, according to Genesis xii. 6, "was then in the land." The English words "morris-dancing" and "merry" come from the same Hamite root, for "the Hamites are naturally merry," says their great pioneer, "though the fact is not mentioned in the Bible." Mr. Morris himself is a man of hilarity, and the future course of humanity, if it will put itself under his direction, is likely to be as full of joviality as it will be of goodness. He has given us a most interesting catalogue of English surnames which point back respectively to Hamite and Shemite progenitors. It is too long to copy in its entirety, but Professor Huxley may be pleased to learn that the anti-Semitic tendencies of David Hume are probably due to his descent from Ham, as a Hume is simply an Anglicised Ham. The late Sir John Goss was a son of the Hamite Cush. Hobbes was an heir of Jebus. Cobbett, if he had been more enlightened than he was, would have boasted that the Hamite Cappad was his ancestor. The Cubitts come from the same stock as the Hamite builders of the Tower of Babel; Sir Philip and Algernon Sydney and Mrs. Siddons were children of the Hamite Sidon. The Gillotts and Colletts may be proud to know that they have the blood of the gigantic Goliath in their veins. A direct descendant of Shem came in course of time to be known in England as Sims. The name Black is evidently a corruption of the Shemite Peleg, and Abbott points back to the Shemite Abidah. Robins and Robinson come from the Shemite Reuben, Smith and Samuda from the Shemite Semida, Meagher from the Shemite Macher, and Aikin and Huggins from the Shemite Achin. The Shemite Boker has turned into the English Baker. The English Hay is the Shemite Ahi, and the Shemite Menasses has become the English Menzies. "There can be no doubt," says Mr. Morris, "that these English family names are really the identical Hamite and Shemite tribal names Anglicized."

But intermarriage and the thousand accidents of history have so confounded the races that the man with a Hamite name needs the warning, and the man with the Shemite name needs the comfort, of being informed that "the evidence of etymology," as applied to surnames, is insufficient to prove whether he belongs to the blessed or the cursed race. The Almighty has mercifully provided a surer test of "the ethnical distinction" betwixt the children of Shem and the children of Ham. Look at the case of "Mr. Barraud." He "was really of the tribe of Bered, and, as such, was a Shemite"; but he married a Hamite; his son followed his example; so did his grandson; hence in the course of time his progeny was partially cured. One child in a family may be a Hamite, while another is a Shemite, as one takes after the father and the other after the mother. But we are all in the dark, except our pioneer. We have "no historical clue," and "as the distinctions of nationality, language, religion, class, and even family names, are perfectly useless for the purpose of identification, there is nothing left but our bodies." The son of Moreh has discovered that all true Hamites, male or female, have a secret mark upon their bodies. No Semitic reprobate has this mark. It is seated, most appropriately, upon the thigh, haunch, hip, or ham. Two prophets, the British Merlin and the Shemite author of the Apocalypse, have had some presentiment of this truth. Mr. Morris refers us to Revelations xix. 16, and to "the Prophecy of Merlin, said to have been written in Cornish or British," and he quotes "a translation thereof published in Edinburgh two hundred years ago." Neither St. John nor Merlin, however, was so clearly illuminated upon the matter as Mr. Morris is. They were not such ardent students of the science of etymology. He has made the great discovery, and he exhibits thousands of etymological "proofs," that the word which stands for hips, thighs, haunches, or hams in "the forty languages and more than a thousand dialects," of which he possesses dictionaries or vocabularies, is derived from one or other of the eminent members of the family of Ham, who are mentioned in the Old Testament. Is not *Hamme* the German for "the ham"? Is not *Hinu* the New Zealander's word for "the hip-bone"? Is not *Gamai* the Wadai-African for "the thigh"? Is it not self-evident that every genuine child of Ham has a mark upon his or her ham? As Mr. Kavanagh, during his philological contemplations, heard the whole creation exclaiming "Oh!" so Mr. Morris, while turning over the dictionaries of languages which he does not understand, saw all the tongues of the world combining to formulate the sentence, "Look for a mark on his thigh." We cannot but admire the stupendous diligence which he has expended in the elaboration of his eccentric gospel. He tells us that his excerpts from dictionaries were written upon more than 80,000 pieces of paper, and that no less than 49,472 pieces were sent to the printer. He thinks that as "folly is long-lived," an exceptionally wise man like himself ought to be patient. He has not rested content with laying down the dogmatic basis of his gospel, which has some curious points of likeness to the system of the Cainites; but he has taken steps "to give the matter a practical form." He has hired an office, or founded a temple of mystery, at 29 Paternoster Row, E.C., where the evangelical business of identification of Hamites is to be carried on. "I will undertake," says the hierophant, "the preliminary duty of personally inspecting those who have the mark, duly registering those who have it." Here too he will qualify a subordinate apostolate for the extension of the gospel; whose business it will be "to set going the machinery necessary for registering throughout the globe all those who have it." No fee is to be received by any registrar for inscribing names on "The List of the Remnants of Ham." The registered persons will be "privileged to join the New Nation"; and much good may it do them. If a sufficient number of copies are sent to the lunatic asylums, Mr. Morris will no doubt receive some replies to his concluding advertisement. "Those, then," he announces, "who first discover that they have on their bodies the faint streaks on which, to them, a new light now shines, are hereby informed that a notification thereof, addressed to me at the office, 29 Paternoster Row, London, E.C., will in due course be attended to, and acknowledged."

GREENHOUSE FAVOURITES.*

THE special merit of this handsome book is its combination of the practical with the ornamental. The author has evidently laid himself out to produce a safe guide for teachable amateurs; and we can unhesitatingly say that we have seldom come across a book of the kind more fit to stand the critical eye of those conversant with the arcana of floral science. Much care has been bestowed upon the nomenclature, derivation, and original habitats of the several plants as they pass in review; and, barring an occasional repetition, the directions for management and cultivation are commendably lucid and intelligible. It must of course be understood that the author nowhere claims to have produced an exhaustive treatise on some thirty tribes of ornamental plants, each of which has once and again been honoured with its own special treatise; but it may safely be said that whoso inquires at this oracle will seldom or never go away with the grumbling comment that, whenever you consult authority on any given subject, it is sure to tell you only what you knew before.

Greenhouse Favourites leads off with the camellia, a showy and brilliantly beautiful plant, which amply repays the shelter of even a shabby and dingy greenhouse. Soon after its first introduction from China and Japan it lost its reputation for hardiness by succumbing in thousands to a severe winter, since which it has not been relied on to flourish out of doors; but not the less may its splendid blooms be enjoyed without any serious outlay of artificial heat in the most old-fashioned of greenhouse structures. Though mostly grown in pots, the camellia is best planted out in the greenhouse border, and always repays the exclusion of scorching sunshine, whether by top lights of rough plate-glass, roller-blinds, or tiffany, or even by the smeared size and whitening which, says the author, if not cleanly or elegant, is at least cheap and effectual. The fact of the camellia not needing free ventilation is its marked differentia from the light-and-air-loving epacris or erica, which would languish in an old, dark greenhouse. It is well to be able to raise the temperature to 60°, and in any case to keep out frost, though, when the wood is ripe, the plant will bear with impunity half a dozen degrees of it. Moistness of atmosphere is a vital necessity for the new wood, and, to avoid drought at the growing season, floor and walls cannot be too freely deluged with water. More air and less water should be given when the bloom buds show at the shoot-tips, and about the end of June all possible ventilation is desirable. Due precautions are suggested as to potting out the plants for ripening the new wood, and if different varieties of bloom are aimed at in January and February, it is important not to put out the camellias too early in the summer, avoiding the scorching suns. Camellias may be bloomed at all seasons; but fine flowers are to be got only between November and April. At the advent of the flowering season it is well to cleanse the foliage, sponging leaf after leaf with tepid water, and substituting for the top soil a little compost. Plants should be in a house with a temperature of 45° by night and 55° by day, raised after a week to 50° and 60° or 65° respectively. The camellia should never flower in a higher temperature; and for prolongation of beauty it is desirable to lower the temperature of a house in full flowering. The plants cannot grow and bloom properly at the same time. When they drop their buds at blooming time, it argues defect of proper water supply. The surface mould may be wet, while the subsoil is dry as dust. Such soil must be probed and stirred to circulate the moisture. The camellia is propagated by seeds, cuttings, grafts, and buds; but amateur-raised seedlings seldom succeed, though

* *Greenhouse Favourites: a Description of Choice Greenhouse Plants.* With Practical Directions for their Management and Cultivation. With Coloured Plates and Wood Engravings. London: Groombridge & Sons.

they may repay the trouble they cost as stocks to graft or inarch others on; and this is the easiest and the best way of grafting and propagating, the spring being the preferable season. The single red is the seed which makes the best stock. Budding is sometimes resorted to in summer or spring as an alternative, but inarching is generally preferred. The soil best suited for camellias, the prescriptions for potting and shifting, and all such niceties are duly given by our author. Amid the valuable list of earlier and later varieties, we may mention Giardino Santarelli, "large, full, with petals regularly imbricated." Its flowers are circular, double, tierlike, and last unusually long in bloom. The prevailing colour is a rich cherry red, with occasional patches of bluish white. Matteo Molfino is a finely imbricated, superbly coloured cerise and white. Comte de Toll is worthy of note as a beautifully formed flower of pure salmon colour.

Not less worthy of its high favour is the fuchsia, as to the introduction of which into this country (in 1788), through a sailor's wife at Limehouse, who cherished it as a souvenir of her husband "from foreign parts," and its naming from the celebrated German botanist, Leonard Fuchs, particulars are given in p. 18. The first introduced, F. Coccinea, came from Chili, and was speedily propagated; F. Lycioides followed in 1796 from the same country; F. Gracilis in 1823, and F. Microphylla, from Mexico, in 1828. Subsequent distinct species—*e.g.*, Fulgens, Corymbifolia, Serratifolia, and Spectabilis—have followed suit, and in their turns have suffered eclipse from later novel varieties. The Fuchsia is propagated by seed and cuttings, though it is waste of time to sow the seeds, except hybridized, because of the tendency of these flowers to sport. To propagate by cuttings is one of the easiest of greenhouse tasks; they will strike almost at any season, and from green shoots or ripe wood alike. The best season is from spring to September. Firm young wood makes the best cuttings, and, if without artificial heat, half ripe wood is best. Fuchsias want abundant water at the roots and frequent syringing over the foliage at most seasons. In winter they should never be quite dry, and the best temperature is 55° by night, and 65° by day. Great are the mysteries of shifting to different-sized pots, of stimulating various stages of growth by weak liquid manure, or a specified substitute for it (p. 25); but, as the author says, "Fuchsia training is very simple if you know their habits," and he spares no pains to promote such knowledge. Much, for instance, is to be learned from pp. 29-35 as to the best modes of training in bushes, pyramids, standards, and round pillars. Pillar training answers best for regularly trained varieties of robust habit of from twelve to twenty feet, well furnished with healthy shoots; and such varieties in a rich soil will be superior to the best pot plants. Wood engravings in pp. 36-7 illustrate two principal advantages of judicious hybridizing in the development of the fuchsia; but we must pass over these in order to give a glance at two or three other "greenhouse favourites," more or less choice and costly of culture. Of such are the Passion-flower and Tacsonia, noble climbers, from Peru and the forests of tropical America, peculiarly fit for houses with ample space for development, to drape columns, to festoon girder interspaces, and trail down rafters in natural pendant fashion. All the tribe, in fact, demand abundant space for roots as well as head. To prevent over-luxuriance a pit of from twelve to eighteen inches deep, and one to three feet square, is often resorted to, with brick, stone, or, best of all, slate sides, made invisible to the eye by a thinly spread layer of earth; and this method of pit-planting is desirable for other climbers in all promiscuously planted greenhouse borders. In passion-flower culture the extension system is best—namely, to train one main stem to a given height and then lead it along the roof space. In training specimens in pots the umbrella trellis and the vase-shaped baskets produce a good effect. The Tacsonias, Eriantha, and Buchanani (pp. 42-47), and the Passifloras are best propagated from cuttings, and these formed of tender shoots after Midsummer.

A great favourite, for its lovely flower and glossy green foliage, discovered in Nepaul by Dr. Wallich, who from the hairs at the base of its petioles called it Hotèia barbata, is the flexile Spiræa, largely supplemented by Dr. Siebold's introductions from Japan. Such species as S. Japonica and Palmata are fit ornaments for greenhouse, conservatory, or sitting-room, and while the prevailing colour of the flowers is white, pink and red are also well represented. Another most beautiful winter-flowering plant, the Epacris, is a native of the Indian Archipelago, Australia, and Polynesia, and takes its name from its habitat, ἐπὶ ἄκρων (on the hill tops). There are thirty known species and many choice varieties, with flowers ranging in hue from purest white to richest carmine, with numerous intermediate tints. Owing, however, to their sensitiveness as to acclimatization, both amateurs and professionals are apt to fail with them. As they flower from January to July, they need vigilant care in the winter months. The propagation is by cuttings, as to which directions are given in pp. 63-4, and a small but good selection is added, of which Epacris miniata splendens (printed in its colours, scarlet tipped with white) is a worthy representative. Amateurs are shy of cultivating the Cape heaths; but it is a mistake to suppose that only professionals can rear them. The ericas' conditions of success are a cool, light, airy house, suitable soil, well-drained pots, and careful watering; but, least of all, do they want overnursing and coddling. Their chief enemy is mildew; the next, undue fire-heat. Heaths are essentially peat plants, and need the best quality of peat for successful growing—peat, that is, of a light fibrous character, not mossy. The ericas have proved a grand field for judicious hybridizing, with an eye to new varieties. But we must find room for a word on the versatile clematis, the graceful "Virgin's Bower," which people would learn to pronounce if they would remember that it is derived from κλῆμα, κλήματος, a vine branch. It is best bought in May, and treated as for outdoor culture, though, as "glorious specimen plants for the conservatory," our author truly avers, "no Pleroma or Franciscea can surpass, perhaps equal them." The clematis climbs everywhere on wall, wire, and round circular, pyramidal, square, or triangular trellis, and it may be propagated by grafting, cuttings, layering, or seed, the third process being the easiest and most common.

It is needless to pursue further the interesting researches and descriptive directions of the author, though it might have been easy with due space to tell the tale of the *Bouvardia*, dear to Covent Garden Market and the cut-flower sellers for bouquet and button-hole; of the Pleroma sarmentosa, with its deep, violet-hued abundance of flowers, discovered by Humboldt in the cool valleys of Peru; or of the "Hoyas" from Java, Borneo, China, and the East Indies, in which one recognizes the umbelliferous, waxy clusters of the so-called honey-plants. We have said enough to indicate the value of a book which may be safely recommended to all who are interested in the subject of which it treats.

SOME MINOR POETRY.*

THE worse side of Queen Elizabeth's character has lately inspired two writers of dramatic verse with a fierce indignation. One of them, indeed, the author of *Ginevra*, has made Elizabeth a prominent and altogether hateful figure in both the tragedies which occupy his or her latest volume. The *donnée* of *Palace and Prison* is at once indicated by the motto chosen for it from John Skelton—"A smile from Mary on the scaffold is worth all the ribbons and garters that the prosperous Elizabeth can bestow." The play opens with a soliloquy from Sir Robert Cecil, who is discovered seated at a table covered with papers. The speech, it will be seen, is remarkable for a "nice derangement" of metaphors:—

> The spider's patient life is mine i'faith!
> Weaving sly webs to catch unwary flies.
> Proof gathers upon proof, and soon the net
> Will close upon the foolish birds, that fain
> Would peck the golden fruit that hangs beyond
> The bars, regardless of the fowler's snares.

In these first six lines we have Cecil combining the part of a spider with that of a fowler who sets a snare, the nature of which it is difficult clearly to understand. In the next lines he becomes a butcher:—

> A prison stays not their keen appetite.
> Faugh! 'tis a butcher's work—smells of the shambles,
> Yet must be done. Heaven, that cased my soul
> Within this pigmy body to fret out
> The scabbard with its use, forbade my star
> Should climb the courtier's gilded path.

It was perhaps a needless precaution to forbid a star to climb a gilded path, and it is unlucky that the author should have chosen to open his play with some of the worst lines that are to be found in it. One is reminded by them of some of the unhappiest performances of Nicholas Rowe and his school. The first two scenes are occupied with a good deal of talk about affairs in the North, and the second is laid at Norfolk House, the master of which is somewhat boldly represented as being a Roman Catholic. "It requires no great stretch of the imagination to suppose that the head of the noble house of Norfolk adhered to the faith of his forefathers," says the author in a note, and no doubt worse tricks have been played with history by successful poets and playwrights; but in this instance we fail to see that much is gained by the liberty. The third scene takes us to Sheffield Castle. Mary Stuart is of course represented in strong contrast to demoniacal Elizabeth. She tells, in some lines which run well and smoothly enough, a dream which she has had

> Last night I dreamed the daughter of Anne Boleyn
> Sat on her throne, crowned, sceptred, and alone.
> I gazed on her from th' end of a long vista,
> On either side hung with rich cloth of gold,
> On which the arms of Scotland and of England
> Emblazoned shone, but quartered on one shield.
> She waved her sceptre, as to beckon me;
> As I drew near she rose and laid her crown
> On the red velvet cushion at her feet,
> Signed me to lay my head beside it there,
> And taking from her neck a string of pearls,
> Threw it around my own—but the light touch
> Sent a cold shiver thro' my shuddering frame,
> As if the headsman's axe lay on my throat!
> I waked—emblems of tears are pearls, they say,
> What may it bode, this dream?

Queen Elizabeth is, as we have hinted, represented not only as a virago, but as a murderous fiend. She threatens Leicester, in a speech which is not without merit, for not declaring his ap-

* *Palace and Prison; and Fair Geraldine.* Two Tragedies. By the Author of "Ginevra" and "The Duke of Guise." London: C. Kegan Paul & Co.

A Queen's Love. A Drama in Five Acts. By M. W. Hilles, Author of "Ornano," &c. Keighley: E. Craven.

Riquet of the Tuft: a Love Drama. London: Macmillan & Co.

proval of the edict which holds Mary responsible for her adherents' acts; and she deliberately proposes the secret assassination of Mary, first to Lady and afterwards to Lord Shrewsbury. The third act, in which this takes place, ends with some odd lines:—

> Her life or mine, ay, there's the rub. So be't!
> I must now either strike or be struck down;
> The dead don't bite, so must the thing be done.

In the fourth act Elizabeth attempts, in a singularly clumsy way, to persuade first Sir Amyas Paulet and then Sir Drew Drury to undertake the secret murder of Mary; and thus it will be seen the author will not allow her the possession of even the most ordinary tact and judgment. The last scene of this act is by far the best piece of work in the play. It passes at Fotheringay Castle, where Mary arrays herself in royal state to receive the warrant of execution which she feels is coming. In her speeches there are some really good lines, which, however, depend so much upon the context that it would be difficult to do justice to them by quotation. As much may be said also of her speeches in the last act; and at the point where Kennedy is arranging her head-dress there is an excellent touch—

> The last pin pricks me; strange that in such hour
> The quivering flesh recoils from pang; as 'twere
> The scorpion's sting of death.

The play ends with a glimpse of Elizabeth's grandeur at the news of the Armada's coming.

In *Fair Geraldine* there is at once less to blame and less to praise than in *Palace and Prison*. The real interest of the play turns on the relations between the Queen and Essex, and the piece ends practically—it would perhaps be better if it ended actually—with her hearing the news of his execution. In the one scene in which she appears after this the author has borrowed, perhaps unconsciously or forgetfully, an odd effect from Mr. Tennyson's *Queen Mary*:—

> *Hunsdon.* Let me entreat
> Your grace to rest on yonder seat.
> *Queen.* The throne?
> 'Tis not empty yet—lower, lower still,
> Here on the ground.

There is less reality about the strange character which the author has called Queen Elizabeth in this play than in the one which precedes it. Her speeches are riddled in both plays with "ha!" and "nay!" and "marry come up!" and "humph!" and "go to!" but these trivial devices, in *Fair Geraldine* at least, do but defeat their own end. The author will do well in future to reflect that the mere sticking on to his dialogue of snippets from Elizabethan phraseology is a vain thing, which can only produce an incongruous and patchwork-like effect. As the Queen's character is made nearly, if not quite, as bad in *Fair Geraldine* as in *Palace and Prison*, a strange effect is produced by the encomiums pronounced upon her by Raleigh, Lee, and Hunsdon, when they think she is dead. The verse, for the most part, runs smoothly enough, but the play wants life.

A Queen's Love deals, like *Fair Geraldine*, with the story of Elizabeth and Essex, and deals with it in much the same spirit; but the workmanship is far inferior. The play opens with the incident of Raleigh, who is represented as being already a knight, putting down his cloak for the Queen to tread on—an incident which has nothing whatever to do with the action, such as it is, of the piece. The general quality of the performance may be judged by one extract from a speech of Elizabeth's:—

> Essex I love, and all the love I've borne
> To Leicester, Raleigh, and all else beside
> That wait upon my smiles, can equal this! (*sic*)
> Nay, 'tis not an atom to the boundless love
> I bear to him! It shall be so, I swear:
> Within an hour from this shall Essex kneel,
> Here at my feet, the king of England's queen,
> And I shall love him with my latest breath!
> Cecil would have me send him to the block
> For his late treasons 'gainst the Throne and State.
> Ah! I would rather lay my own head there
> Than see him perish! In his life I live,
> And should he fall, oh, then farewell indeed
> To throne, and state, and power, and all its pomp!
> Essex, my love, for thee alone I live!

Riquet of the Tuft: a Love Drama, is rightly named in part only. It contains a good deal of "elegant diction" and long-drawn-out prattle about love, but it is in no sense dramatic. There is much metaphor and simile, more or less laboured, with some pretty conceits, and a large amount of description. Of this a not unfavourable specimen may be quoted:—

> The weather changed and with it changed my mind;
> And the rain fell and all the welkin roared
> From east to west with thunder as I rode,
> Slow climbing up the gorge, and heard below
> The swollen river, like a beast of prey,
> Howl louder than the thunder—and a darkness
> Clutched at my heart. But I crept on and came
> Where the gaunt cliffs had narrowed to a gate,
> Through which I hardly passed, and found a plain
> Full of marsh streams, winged-round by snow-streaked hills,
> And lonely as a broken heart. At last
> I touched the summit of the pass, and lo!
> The west was like a crystal water clear.
> Behind me rolled the storm, and at my feet
> An ancient forest seemed to fill the world.

The author has varied the old story by a device which does not strike us as particularly happy. According to him, Riquet has the gift of being able to make "the woman who loves him as wise and as witty and pleasant as himself." To match the witty and noble, but deformed, Prince there is of course a dull beauty, upon whom he bestows his gift, but who does not at first fulfil the conditions of its bestowal, which is inconsistent. In a scene between them, by the by, the author adopts the common mistake that Galatea was actually the name of Pygmalion's statue—a mistake for which, so far as we know, Herr Suppé, or his librettist, is responsible. His work contains some prettyish, and even pretty, passages; but is for the most part characterless and dull.

FRENCH LITERATURE.

FEW more interesting volumes have been recently contributed to the study of the early seventeenth century in France, and especially to the all-important history of Richelieu, than that which M. Zeller has just brought out (1). The author has proved his historical competence, not merely by some useful works on early French history, but by a detailed examination of the original, and for the most part unpublished, authorities for this very period in his study on *Le Connétable de Luynes*. The present volume might, had M. Zeller been intent upon a sensational title, have been headed *Entre Luynes et Richelieu*, for it is exactly that remarkable gap in the fortunes of France which he fills up. Between Luynes—who was altogether a creature of the King's—and Richelieu, who, as this book goes to prove, was very much the reverse, there was a singular interregnum, during which the Bishop of Luçon was slowly making his way, assisted by the Queen-Mother, who in her turn, like most of his supporters, was destined to regret having supported him. The names of the nominal Prime Ministers of France during this period are, as M. Zeller very justly observes, half-forgotten names. Henry—the second Henry—of Condé, the Chancellor Brûlart, his son Puisieux, and the financier La Vieuville, are not persons about whom the historic Muse has hitherto much busied herself. Yet the period was an important one, and perhaps more than any other space of time determined the future policy of the great statesman who was biding his opportunity, and who, by a happy distortion of facts, was able to present himself as a liberator of Europe against the ambition—in itself a far less dangerous ambition—of the House of Austria. The special sources of information which M. Zeller has consulted are three—all of them, as usual at that time, Italian. They are the Papal Nuncio, Ottavio Corsini, the Venetian Ambassador, Giovanni da Pesaro, and the Florentine Ambassador, Giovanni Battista Gondi. The extraordinary minuteness with which Italian resident Ministers reported the affairs of foreign States in the sixteenth and seventeenth centuries is sufficiently well known, and the three here laid under contribution are not inferior to others of their kind.

M. Blaze de Bury (2) has collected a considerable number of articles which during the last fourteen years he has written on the great musical-theatrical composers of the last and the present century. Gluck, Mozart, Rossini, Weber, Hérold, Halévy, Verdi, Gounod, Bizet, Berlioz, and Wagner compose his team. Bizet and Halévy may seem to some people to be rather strangers in their company, while Auber and Meyerbeer might very well take their place; but critics must of course be allowed to a certain extent their freedom of selection of the things to be criticized. M. Blaze de Bury has the courage of his opinions, and it is at least to be said in his favour that he does not stun his reader with technicalities after the fashion of some musical critics in this and other countries. At the same time it must be said that his style is by no means of the purest. There are painful efforts at liveliness, and every now and then sentences occur which would make any severe critic of French prose gnash his teeth. For instance, we open the volume at hazard, and come upon the following words:—"Richard Wagner est sans aucun doute une individualité dans l'histoire de la musique, mais vouloir faire de lui la plus haute personnification de l'art présent et futur constitue une de ces plaisanteries qu'il faut laisser aux gens doués de crânes assez durs pour venir à l'instar des béliers antiques battre en brèche les temples sacrés des anciens maitres." With the sentiment expressed in these lines we have nothing to do, but the clumsiness of the manner in which it finds expression cannot be passed over. The sentence is bad German or worse English translated literally into French. It is not French (as French sentences of the best model go) at all or in any way.

M. Alphonse Karr is sufficient in his own person to furnish materials for a monthly review of French literature. It would be a little interesting to see whether the reprinting of the contributions of Englishmen to daily and weekly journals would be recognized by public opinion as a legitimate proceeding. Tradition has it that French literary journeywork is, as a rule, so much better done that it deserves translation from the files of the newspaper to the shelves of the library. Perhaps it may be so; but we must confess that we find some difficulty in assigning to this volume of "Buzzings" (3) any place in perpetuity on the shelves of the most indulgent library. It is not that the matter of it is bad; quite the contrary. But it is matter purely ephemeral. In 1874 as now M. Karr was firmly convinced of the falsity of the way in which French Republicans were leading France, and he was not in the least afraid of making known his conviction. It may be added that some expressions of his about M. Gambetta

(1) *Richelieu et les ministres de Louis XIII de 1621 à 1624.* Par B. Zeller. Paris: Hachette.

(2) *Musiciens du passé, du présent, et de l'avenir.* Par H. Blaze de Bury. Paris: Calmann Lévy.

(3) *Bourdonnements.* Par Alphonse Karr. Paris: Calmann Lévy.

are singularly appropriate even now when circumstances have changed with a rapidity which we may feel sure is by no means pleasing to M. Karr himself. But still the matter of this volume is wholly and exclusively the matter of leading articles, and leading articles, as the most assiduous composers of them would admit, are neither intended nor suited for book publication. Attacks on Marshal Bazaine, for insta[illegible]
and will from this time into eternity be of interest, only to the person who sets himself to write the history of the *Septennat* and the events which led to it. Now the person who sets himself to write the history of the *Septennat* can find M. Karr's articles in the files of the newspapers where they originally appeared. The process of looking over such files is sufficiently dreary for those who have their account to find in it. For those who have not, it is, to say the least, painful to expect a volume of M. Karr's well-known chat on things in general, and to find only political talk of a somewhat amateur description.

The ninth volume of M. Louis Blanc's English sketches (4) contains some interesting letters. Accident has collected in the volume a variety of subjects, some of which have an attraction independent of the circumstances of the moment, and some of which have, by a strange coincidence, a remarkable reference to the affairs of to-day. Among these latter must be classed M. Blanc's letters on the Eastern Question, which may be consulted with not a little advantage by those who wish to see the prophecies of the policy of the Gladstone Government of to-day contained in the conduct of the Gladstone Government of 1869. It so happens, too, that Mr. Gladstone himself fills a large space in M. Louis Blanc's ninth volume. His explanations of his Irish Church programme had not then the piquancy which they attained during the Midlothian campaign; but they were odd enough to surprise M. Louis Blanc. The celebrated outbreak of Mr. Bright against the Bishops because their income was on the whole double that of his own office surprised and shocked M. Blanc in a manner creditable to his sense of decency, and to his power of perceiving faults in those of his own side. An interesting obituary of Ernest Jones is to be found here, and one not much less interesting of that good servant of English literature, Robert Bell. Some considerations on the House of Lords, written as they of course are in a Radical sense, are instructive to read nowadays, because they recognize the absurdity of attempting to reconstitute that House in the sense of a mere elective Second Chamber. Lastly the articles on the Harvard and Oxford rowing-match are not to be passed over, because they show how, even at this time, after his long residence among us, the author was outside of what may be called the real ideas and principles of Englishmen. Fortunately none of M. Blanc's special hobbies come into this volume, and therefore he cannot display his powers of hobby-riding.

In publishing the Letters of the Présidente Ferrand (5), with certain explanatory additions and comments, including the curious *Histoire des amours de Cléante et de Belise*, M. Asse has not rendered quite so much of a service to French literature as he has done in some preceding publications. The letters, and still more the history, are little more than an exhibition of that *commerce rampant de soupirs et de flammes* which Racine had rendered fashionable, and which Corneille had so admirably denounced a little before Cléante and Belise began to sigh and flame for each other. The lady was the wife of the President Ferrand, and was of Italian extraction; the gentleman was the Baron de Breteuil, a name then and afterwards sufficiently well known among the French aristocracy of the more recent kind. The weakness of the late seventeenth century could hardly be better exhibited than in these letters; but there is little trace in them of its strength. A reader who should read them knowing little else of the time would enjoy Molière more than ever; but he would hardly be able to understand La Bruyère and Saint-Simon, still less La Rochefoucauld and Saint-Evremond. Flirtation of the most artificial kind, without fantastic grace and without serious passion, is the staple of the book, and a very little of it goes a very long way.

M. Semichon (6), who, besides being a lawyer and a former Conseiller-Général, has been in his time an Inspector of children receiving public aid in the Department of Seine Inférieure, has had exceptional opportunities for writing a history of foundlings. The only objection that can be made to his book is that it is in some sort too cursory, and does not fill out its abundant stores of statistical and historical information with sufficient description and detail. The book is not confined to France, but embraces a view of the systems of rendering assistance to deserted children, or children whose parents are unable to support them, adopted in all modern countries, besides a sketch of the treatment of infants in ancient times. M. Semichon makes the most of the infanticide which beyond all doubt was a blot upon almost every pre-Christian civilization, and he does not hesitate to expose the drawbacks of the system of *Tours* or unlimited institutions for the reception of foundlings, which till recently prevailed in France. On the whole, the book is likely to be a useful one to the student of modern economics and social philosophy.

Anybody who is in search of an uncomfortable book may be recommended to Leopardi's prose Opuscula (7), as translated, for the benefit of those who do not read Italian, by M. Dapples. The translation is a very good one, and one feels few of the usual drawbacks of reading a book in a language in which it was not written. The pieces are for the most part short, and are couched in the form of dialogues, satirical fables, or other suchlike things. They have abundance of imagination, as indeed might be expected in the prose work of a great poet, and not a little of the peculiar burlesque which for Italians replaces English humour and French wit. Léopardi, it should be observed, is becoming a favourite subject with French translators. It is rather odd that the restless persons who are always longing to "English" something should have so long left him alone.

M. de Kaufmann's pamphlet (8) is a short treatise in a moderately but still very definitely protectionist sense on the advantages of a Zollverein for Central Europe, from which Russia, America, and England are to be excluded "as the wolf from the fold."

Five parts of the new edition of M. Vapereau's valuable Dictionary (9) bring it up to the biography of Mr. Tennyson, and leave but little to be done to complete the issue. As far as the French articles are concerned, there is no fault to find with the working up; matters so recent as M. Renan's Hibbert Lectures being duly noticed. The foreign items are naturally not quite so well attended to, yet even here the Dictionary contrasts very favourably with most books of the kind which have been put forth in any other country.

M. Dumas informs us that *Tiphaine* (10), to which he has contributed a preface, is not his own, but is a true tale by one of his friends who has not allowed even M. Calmann Lévy to know his identity. Politeness demands that we should give credence to this statement, and resist the temptation to believe that M. Dumas has written a book for the sake of attaching thereto a preface in his well-known style. As a book in the mechanical and strict sense of the term, *Tiphaine* deserves that all men should speak all good things of it. It is printed in a pleasing small quarto, or rather square 16mo., on paper of a super-excellent kind, and with an infinite quantity of margin. As a story we do not know that we can say quite so much for it. The principal reflection that it suggests to the English reader is that the autobiographic hero was a consummate donkey, and also (colloquial language is unavoidable) a consummate cad. As a young man he had made the acquaintance of a little girl who has a large fortune. He loses sight of her, and she marries a *vaurien* who is killed in a duel. Then he meets her again, and she very frankly tells him that she, not to put too fine a point on it, loves him. Instantly he, who is young no longer, thinks that she is inviting him to consider himself her lover in the French, not the English, sense. She perceives it, and very sensibly withdraws, promptly marrying somebody else, and abstracting from the coxcomb-hero not merely herself, but twenty millions French—that is to say, nearly a million English—as well. The verdict of course is "serve him right," and M. Dumas is not altogether far from echoing this verdict. He does not, however, seem to know how near he is, and it is much to be feared that his countrymen will not draw the moral. If anything could make us believe in the genuineness of the story, it would be M. Dumas's remarkable abstention from pointing this moral, which it would seem is as obvious as anything can well be. In another writer the argument would not count. But M. Dumas is a preface-writer or nothing.

Poverina (11), which may be taken without rashness to be the work of the lady whose *Carmela* was recently translated into English, is a sufficiently graceful and pathetic story of Italian peasant life in Lucca. The ways of the inhabitants of that frugal province, their occasional emigration for a few years to South America in order to get together a modest capital, and their subsequent return to their homes to buy a few acres of vineyard and oliveyard, and live the rest of their lives placidly with parrots and lories flying about them to remind them of the land of their exile, are pleasantly sketched in the opening pages. Poverina is a sort of foundling, a child saved at the point of death from its parents by a benevolent woman who goes under the name of *La Strega* from her apparently uncanny powers of bringing up weakly infants. How La Poverina grows up and develops a magnificent voice; how she falls in love with a greedy ne'er-do-weel, whose one idea is to make profit out of her; and the rest of her fate, readers may learn with satisfaction to themselves from the pages of the book. *Les mouches du coche* (12) is an ambitious story in which the author has striven to unite the political novel with the sketch of the *vie de province*. The result is not of the happiest, the satire being for the most part laboured, and the author's Republican ardour apparently producing in him that insensibility to the really ludicrous which Republican ardour somehow has a knack of producing. His penultimate page contains a quaint example of this. "Les nouveaux époux," says he, "au lieu d'aller fouler les sentiers banals de la Suisse ou de l'Italie, avaient choisi la libre et forte Amérique pour y fêter les premières joies de leur union." In paying this compliment to free and strong America, M. Jacolliot has apparently forgotten that ten days of sea

intervene between that paradise and effete Europe. If the newly wedded pair were not good sailors (and very few Frenchmen or Frenchwomen are), it seems odd that they should have chosen to "fêter les premières joies de leur union" by ten days of sea-sickness. *Prégalas* (13) is a book not exactly novel in its main idea, but executed with a certain amount of power. The invention which exerts a sinister influence on the fortune and family of the inventor has been heard of before in novels. But the freshness of the handling justifies the selection of an old theme, and some of the characters, especially that of the faithful clerk Bidoche, deserve a good deal of praise. M. de Letorière has read his Feuillet well, and not unwisely. The story of *La Marquise de Trévilly* (14) is decidedly of the school of the author of *M. de Camors;* but it is in no sense a servile copy. Moreover, M. de Letorière is possessed of the faculty which used to be one of the commonest among French writers, and which is now, on the contrary, one of the most rare. He can really produce *mots* of some sparkle, and they enliven his pages considerably. It is only to be regretted that the sentiment of the book is somewhat morbid, and that the machinery of telling the story is to the last degree absurd. A young man meets an older friend in Paris, and the old friend first indulges in some exceedingly stale objurgations of the other sex, and then, to justify himself, takes the young man home and tells him a mortally long story —in fact, the whole book. This introduction is not in the least necessary, and might have been cut away with no loss and much gain. *On n'entre pas* (15) is a collection of short stories, or rather sketches, of the socially satirical order. They are neither very good nor very bad; their chief fault being the selection of very hackneyed subjects, and the adoption of a too elaborately facetious method of treatment. *L'héritière* (16) is apparently a translation of Miss Florence Montgomery's *Seaforth*, though no translator is mentioned. There is a great oddity in the recurrence of the phrase "Le noble lord," the translator not being aware that this phrase is only in place in Parliamentary and other formal proceedings.

TURKEY AND THE POWERS.

AS long as the concert of the Powers is not openly dissolved, it is inexpedient to inquire too closely into its possibilities of failure. If it ultimately succeeds, it will have effected an object which could not otherwise have been attained. One of the most obvious objections to the enterprise has been removed since its commencement. It was highly invidious to compel the Albanians to submit, in obedience to the orders of the SULTAN, to a transfer of their allegiance to a State which they regarded with hereditary enmity. Although international law takes no cognizance of subject tribes or districts, modern sentiment justly disapproves of the suppression of local rights by external and superior force. At the moment when the Montenegrin troops, countenanced by the vicinity of the European fleet, were about to attempt the occupation of Dulcigno, the state of affairs was suddenly changed by the declarations of RIZA PASHA. The SULTAN, who had repeatedly excused himself on the ground of unwillingness or inability to coerce the Albanians, now made himself a principal in the conflict by announcing, through the general in command, that a movement on Dulcigno would be treated as an act of war. The combined Powers were at once relieved from the difficulty of dealing with the Albanians, and they had a formal or technical cause of quarrel with the Porte. They, or some of them, are, as the Minister President has lately informed the Hungarian Parliament, nevertheless anxious to avoid a rupture with Turkey. The delays which have again and again been allowed have probably encouraged the resistance of the SULTAN; but it was prudent to abstain from violent measures as long as there was hope of an amicable settlement. English opinion has during the late negotiations and movements been on the whole creditably held in suspense. The example of the present Ministers while they were in Opposition has not been followed. An active and separate co-operation with Russia would be severely blamed; but as long as Germany, Austria, and France are professedly satisfied, Englishmen are content to await the result of a strange and unpromising experiment. Different feelings will be excited if the demonstration of naval force is, at the instance of the English Government, transferred from the Albanian coast to the Dardanelles or the Sea of Marmora; but still the public judgment will ultimately depend on the continuance or dissolution of the European concert. It seems highly improbable that Austria or Germany will concur in a measure which would amount to a declaration of war against Turkey. France also, unless the present Ministry display unexpected enthusiasm in the cause of Greece, will scarcely consent to send a contingent to the Dardanelles. Any operation of the kind undertaken by a Russian and English fleet would provoke just disapproval. A menace against Constantinople by the whole combined fleet, when it was known that no troops were to be landed, would be simply ridiculous; but the English Government would not be more justly exposed to ridicule than its allies.

The SULTAN has, by the elaborate Note presented a few days since to the Ambassadors, relieved the Powers, and especially England, from some moral and diplomatic embarrassment. The utterly inadmissible demand of a promise that no naval demonstration shall be hereafter attempted has no precedent but the similar pledge as to the HOHENZOLLERN candidature in Spain which was required by NAPOLEON III. from Germany when he had formed the fatal resolution of going to war. It is difficult to understand why the remainder of the Turkish Note should have been composed or presented, when the preliminary condition was certain to be rejected. It is not worth while to examine the ostensible offer of concession as to the Greek frontier, which directly contravenes the unanimous decision of the Conference of Berlin. The Porte has staked its fortune on the chance that the European concert may be dissolved; and it has at the same time used the most effective means to cement and strengthen the union of the Powers. The passage in the Note which relates to the passes of the Balkan and the Danubian fortresses would have been unanswerable if the SULTAN had on his part announced his intention of discharging his obligations. It is nevertheless to be remembered that a contumacious refusal is a just cause of war only when the rejected demand was just and expedient. The Government which has taken the initiative is more especially bound to prove that its interference was prompted by a sincere and consistent regard for the sanctity of treaties. Although the principal motives of its late action may perhaps have been personal and sentimental, the naval demonstration can only have been justified by the belief that conformity with the provisions of the treaty would tend to secure the peace of Europe. The Montenegrins, though they command the imaginative sympathy of the PRIME MINISTER, have no claim to material assistance from England. The only political result which is likely to follow from the cession of Dulcigno is the practical acquisition by Russia of a third-rate naval station in the Adriatic. The united Powers had a legal right to enforce the transfer of territory to which the SULTAN had formally submitted. It is a nicer question of international law whether any one or two of the Powers would have been entitled to act in the absence of the rest. The proposed extension of Greek territory stands on an entirely different footing from the transfer of Dulcigno. The Greek arrangements form no part of any treaty, though the principle has, during a long negotiation, been admitted by the Porte. The resolutions of the Conference of Berlin can only be enforced in virtue of a supposed right of the Great Powers to regulate the political and territorial condition of Europe. If they agree in executing the decree of their Plenipotentiaries, protests against irresistible force will be wholly useless. The annexation by Austria of Bosnia and Herzegovina furnishes a practical precedent for the further dismemberment of Turkey; but it was enacted by the treaty to which the SULTAN was a party.

Mr. GLADSTONE and Lord GRANVILLE will have provided the best possible excuse for their apparently paradoxical policy, if their sudden and cordial alliance with Russia enables them to prevent by friendly means the prosecution of subversive intrigues in the European provinces of Turkey and in the neighbouring Principalities. The rumour of preparations for war in Bulgaria, in East Roumelia, and in Macedonia may perhaps have been exaggerated; but the existence of a widely spread conspiracy against Turkish rule is not subject to doubt. The application lately made by East Roumelia to Bulgaria for a considerable loan can only have been made in anticipation of rebellion. It is also certain that large numbers of Russian officers and soldiers have been allowed or directed to proceed to Bulgaria; and General TCHERNAIEFF,

the principal promotor of the Servian war, is at present in the country with the probable purpose of renewing his former efforts. It is asserted that a body of Russian engineers is busy in the Shipka Pass, with the not immediately urgent duty of erecting monuments to the Russian officers and soldiers who fell there in the war. They may possibly occupy their leisure with the construction of forts, of military roads, and of other works which might be useful in the event of another invasion of Turkey. It might perhaps not have been incumbent on the parties to the Treaty of Berlin to protect the greatly reduced Empire of the SULTAN from further reduction, if the treaty had once been put in full operation, or if the performance by the Porte of its obligations had not been made compulsory; but zeal for compliance with the engagements of Berlin ought to be impartial. One of the principals in the negotiation and settlement is believed to participate in the designs of the SULTAN's malcontent subjects and hostile neighbours. The Government of Bulgaria and the population of East Roumelia are not likely to move without encouragement or instigation from St. Petersburg; and if they engage in war on their own account, they are, after all the losses and misfortunes of Turkey, no match for the remaining force of the Empire. It is absolutely in the power of Russia to prevent further encroachments on the European provinces of the SULTAN; and if the English Government has not established an understanding with Russia for the maintenance of peace, cooperation with the possible disturber of Europe will have been inexcusable. It is not a trifling evil for an English Ministry to have reversed within a few months the deliberate policy of its predecessor. Fanatical journalists may contend that the Treaty of San Stefano, which they prefer to the Treaty of Berlin, ought to be re-established; but a responsible Government is not at liberty to disregard in the interests of faction or of bloodthirsty philanthropy the honour of the country. If the Treaty of Berlin is to be enforced, it ought to be maintained as a whole. It may be hoped that the discreditable suggestion of a seizure of some of the Turkish Customs duties has been made by a violent partisan without authority from the Government.

FRANCE.

THE new French Ministry has for the moment settled down and does its work in seeming peace. At the age of seventy-five, after a life devoted to philosophy and to the cultivation of a romantic friendship for M. THIERS, M. BARTHÉLEMY ST.-HILAIRE was suddenly summoned to the Foreign Office, and President GRÉVY had a new Ministry fully formed. The new Foreign Minister was selected as an embodiment or advertisement of a policy of peace. A very old man who knew nothing about foreign affairs, and was without any Parliamentary following, seemed the kind of Foreign Minister to convince the world that France was determined to keep as much as possible to herself, and mind no business but her own. Accordingly, the PRESIDENT selected him, and the selection, if it did nothing else, served to remind France of the curious Constitution under which she is living. The President of the French Republic is a new experiment in constitutional history. The Government is his Government. He is not like a constitutional sovereign who allows one set of Ministers after another to govern according to their own ideas, so long as they can command a Parliamentary majority, and with perfect impartiality accepts a succession of advisers whose errors do not touch him. The French President has a much more difficult task. He has to see that affairs are properly conducted during the term of his Presidency. But he has also to pay continual deference to the wishes and opinions of the majority of the Chamber. His Ministers stand or fall according as they satisfy or do not satisfy the requirements of the Parliamentary majority. He has thus at once to lead and to follow. He has alternately to efface and to assert himself. M. GRÉVY notoriously approved of the policy of M. DE FREYCINET; but when he was informed that the Parliamentary majority which is at the command of M. GAMBETTA would no longer tolerate M. DE FREYCINET, he had to part with him and to put in his place M. FERRY, who had for the moment the promise of the requisite support. To balance this concession he chose a Minister of Foreign Affairs who had no connexion with the Parliamentary majority, and whose great merit was that, if he had any opinions on foreign affairs, he had opinions unlike those attributed to M. GAMBETTA. That a President should thus govern without exactly governing seems an anomalous arrangement, but it is one which is intimately associated with a whole circle of French ideas. The Government of France has to govern, and is expected to govern, to an extent to which there is no parallel in England. It does not go by general rules, but thinks itself free to interfere or not to interfere as it judges best in each particular case. It has just allowed the Legitimists to assemble in all their strength and publicly drink the King's health, because it considers them to be a set of harmless old women. It has refused to allow a meeting of Irreconcilables to discuss the foreign policy of France, because it judged that the meeting might give rise to popular excitement. From government of this description the President cannot hold himself aloof. It is his Government that acts, and he is held bound to see that it acts properly. In order to play his part he has not only to be in general harmony with the party which raised him to power, but to keep, so to speak, a hold on the Ministry, although the Ministry is in the main appointed in deference to the wishes of the Parliamentary majority. He may signalize this hold on the Ministry in different ways at different times, and the mode he has now selected is to make M. BARTHÉLEMY ST.-HILAIRE, of all the people in the world, Foreign Minister of France.

M. GAMBETTA may be amused at the selection, although he knows precisely what it means; but he cannot object to it, for he would certainly, if he became President, never consent to lose his hold on a Ministry, and also because he takes repeated and constant pains to show that the DE FREYCINET Ministry was only overthrown on a purely domestic question. This question was of course the treatment of the religious orders. M. GAMBETTA is very anxious to have it understood that what he and his friends objected to was not a temporary leniency and reserve in dealing with the orders. In point of fact, the new MINISTER of the INTERIOR is going to do very little more than what M. DE FREYCINET proposed to do. He, like the chief of the fallen Ministry, is willing to let the really difficult part of the business, the treatment of recognized orders composed of Frenchmen, stand over until the Tribunal of Conflicts—the tribunal that decides whether an act purporting to be a purely administrative act comes within the competence of the legal tribunals—gives its decision when it meets in November. What M. GAMBETTA objected to, and what he said his Parliamentary majority would object to, was that temporary indulgence to the orders should have taken the form of a bargain. It is represented as humiliating to the Government and to France to have regarded the Church as a power with which terms, if sufficiently favourable to the Government, might properly be made. That is represented as degrading which to others seems highly sensible and very natural in a country the relations of which to the Vatican are still regulated by a Concordat. As far as can be ascertained, the bulk of the French population is entirely indifferent as to the treatment of the orders. It cannot see why it should trouble itself whether a number of priests are or are not sent out of the country. A sleepy selfishness is the prevailing spirit of the French peasantry; and, so long as they are not touched, they do not care whether other people are hurt. But the representatives of the Republican party are not in this passive state. They are possessed by what they consider to be Republican ideas, and one of these ideas is that the Church must be put in its proper place. One mode of effecting this is to extrude it from the sphere of education. The new Ministry has begun to show its activity in this direction. Whatever his faults may be, M. FERRY has at least the courage of his ideas. He sees that secondary education is the real battlefield on which the victory is to be won or lost. If the Church is not to control this education, and the State is to control it, the State must decide what it means by secondary education, and must provide adequate machinery for giving it. M. FERRY has already begun to work hard in both these directions. He is still Minister of Public Instruction, and in that capacity he has issued a programme of what secondary education is to be under his rule. His ideas are, according to English notions, very sensible. He directs

that the study of Latin shall be encouraged; that smattering in science shall be discouraged, while an opening is given for a real pursuit of scientific knowledge; and, above all, that the classes shall be of such a size that the teachers can really teach them. Then the material apparatus for secondary education is to be entirely recast. Existing buildings are to be reshaped. Playgrounds are to be provided. Six new lycées are to be created in Paris and its suburbs. There even seems to be a romantic plan for creating delightful retreats for secondary education in such places as St. Cloud and Fontainebleau. All this will cost a vast sum of money. But it is hoped that the Municipal Council of Paris will contribute handsomely, and that body is now so rich that it has thought itself obliged to get rid of a surplus by setting up some of the ugliest statues that were ever devised, on what is now known as the Place de la République. The Chamber will have to do the rest, and in order that the Chamber may be induced to grant the funds, the Ministry that proposes the grant must be in complete harmony with the majority.

If the peasantry—that is, the silent inert body of voters who in the long run make and mar all majorities—are indifferent about religious controversies, and wholly unconcerned about secondary education, with which they have scarcely anything to do, they are resolutely set on preserving peace. The dislike of the French to get entangled in the Eastern question, although no doubt used as a weapon and exaggerated by the adversaries of the Government, appears to be genuine and general. There may be some sentimental and transitory reasons for this dislike. There seems to be a vague idea that France, which felt so keenly having Alsace and Lorraine torn from it, cannot join in tearing provinces from another conquered Power. Then there is a notion that in the European concert Germany will be certain to play a bigger fiddle than France. A wish is thus inspired to keep out of the competition, and there could not perhaps be a better mode of indicating that there is no rivalry than to make M. Barthélemy St.-Hilaire the musician of France, while Prince Bismarck is the musician of Germany. But there are much deeper causes of the pacific feeling in France than these. In the first place, there is the horror of war which now pervades most European nations, and is felt quite as strongly in Germany as in France. Then the French at the present moment see their way to even greater prosperity than ever, and they do not like to lose the chance of a really good time. There was an increase in the imports in August alone of more than a million sterling, and it is painful to check business just when it is beginning to be especially brisk. But, more than all, there is the conviction that the one necessity for France when she thinks of Germany is to be patient. A premature war might undo all that France has been doing for the last eight years. She has been gradually forming an army of quite a new character and on quite a new scale. The greatest efforts are constantly made to render this army mobile, intelligent, highly disciplined, and perfectly equipped. But, although the present French army is quite a different army from that which was created and sacrificed by the late Emperor, it is not the army which France means to have. To bring it up to what it is intended to be means to spend much time and much money, and the French want to keep out of all enterprises, and to earn enough money to lavish it on the army before they put their new mechanism to the proof of war. But, although this is the main wish and purpose of Frenchmen, there are Frenchmen who see that there is always danger of a reaction. If France, through being over-pacific, slipped out of her position as one of the Great Powers, the nation might some day feel humiliated, and might cry out for a change of policy, and listen to those who would say that the Republicans did not know how to maintain the dignity of the country. The nation must so wait that it shall not get tired of waiting. M. Gambetta is one of these Frenchmen. At the present moment he is setting himself resolutely against the popular feeling, so far as this feeling seems to him to be running into a dangerous extreme. He ventures to proclaim as loudly as he can that France must not abandon her position as a Great Power, and must play a decorous part in the European concert while it lasts. Whether in this he represents the Parliamentary majority is uncertain. Not improbably he may once more show himself as an opportunist, and give way to a current of feeling that he considers too strong for him. But, if the day of reaction comes, he will at least have secured a position which will enable him to say that the real leader of the Republican party, if he wished France to wait, also wished her to wait with dignity.

THE STATE OF IRELAND.

THE state of Ireland becomes every day more alarming, and its causes, if possible, become more obvious. On Thursday a great meeting of landowners was held in Dublin, and deputations waited on the Lord-Lieutenant and his Chief Secretary with a request sufficiently humiliating to those functionaries. They wished to know whether the Government would protect them, or whether they were to undertake that duty themselves. It is stated that Lord Cowper and Mr. Forster fully admitted the accuracy of the facts upon which this request was based; it is not stated how far they complied with it. Meanwhile unscrupulous demagogues repeat with perfect impunity undisguised incitements to crime; and their disciples respond by threats against landlords and honest tenants, by brutal cruelties to men and animals, and by safe and popular murders. The priest of Lord Mountmorres's parish, not content with calumniating the unoffending victim, asserts that his parishioners, who openly applauded the deed, were innocent of its perpetration, and that the Government which protected landlords in their rights was really responsible for the assassination. One speaker quoted from Mr. Froude an opinion that in Ireland the State ought to acquire possession of the land. He of course omitted to state that Mr. Froude insists on the payment of full compensation to owners. He could scarcely have been expected to add that in the same essay Mr. Froude urges with forcible eloquence the paramount necessity of silencing seditious orators and of hanging criminals who incite the populace to murder. As might be supposed, the agitators find an inexhaustible store of suitable quotations in Mr. Gladstone's later speeches. The objections to unlimited indulgence in Liberal generalities, and to rhetorical denunciation of political opponents, could not be more strikingly illustrated. Reckless volubility and factious exaggeration are perhaps not consciously employed for mischievous purposes; but they indicate a blamable indifference to public interests in comparison with the gratification of vanity and passion. Mr. Parnell has not forgotten Mr. Gladstone's wanton declaration that landowners in England or Ireland might be rightfully expropriated by Parliament if it were thought expedient to transfer the land to the occupiers. Another agitator complained that a eulogist of Irish rebels had forgotten the exploits of the Fenian conspirators, "which had been recognized by a greater man "than himself." In reference to the same speech of Mr. Gladstone's, an excited mob responded to the exhortations of a demagogue by the significant remark, "We don't "forget Clerkenwell." Mr. Parnell, in a part of one of his speeches which was devoted to the extenuation of the guilt of recent agrarian murders, sneered at the importance attached to the death of one or two landlords when twenty-five thousand members of evicted families had perished within the year. As usual, he was able to quote the authority of Mr. Gladstone in support of his shameless apology for crime. There were, said Mr. Parnell, 5,000 decrees of eviction, affecting on an average five persons in each family. Mr. Gladstone had said that eviction was equivalent to a sentence of death; and therefore it might by Irish logicians be inferred that 25,000 evicted persons had died. Mr. Parnell of course knew, what Mr. Gladstone when he introduced the Disturbance Bill had not contrived to learn, that decrees of eviction are seldom followed by actual change of occupation, and that probably he could not have proved that one of the 25,000 deaths had really occurred. In all these cases oratorical exuberance is by an easy process converted into deliberate assertion. The commentator who separates suitable quotations from the context is more culpable than the thoughtless declaimer who propounds dangerous doctrines without considering their meaning or their consequences; but a statesman occupying the highest place in the Empire must be prepared to be judged by a higher standard than the professed adversary of law and order.

Although it is impossible to abstain altogether from expressions of indignation against the promoters of

anarchy in Ireland, they are beyond the reach of remonstrance. Agitators who have made up their minds to encourage robbery and not to discourage murder have nothing to learn of the opinion which is entertained of their conduct outside the circle of their own accomplices. The question is not whether the guilt of the demagogues is more or less atrocious, but how their efforts are to be counteracted. The Government has to choose among the methods of prevention or alleviation which are within its present powers, or which would on its demand be readily granted by Parliament. The only measures yet known to have been adopted are a circular to the Constabulary, and an offer of a reward of 1,000*l.* for the discovery of the assassins of Lord MOUNTMORRES. A much larger sum failed to tempt any of the numerous persons who could have pointed out the murderers of Lord LEITRIM to incur the vengeance of the agrarian conspirators; but the CHIEF SECRETARY is undoubtedly right in offering a considerable price for information. The most important instructions given to the police are probably confidential. It was perhaps judicious to discontinue their attendance at seditious meetings, where for the most part terror or sympathy ensures apparent unanimity, and therefore renders breaches of the peace on the spot improbable. The reported inaction of the Constabulary on some occasions when meetings have resulted in outrages to property may perhaps admit of explanation. There is probably no foundation for the statement that the Government has proposed to increase the military force in Ireland; and it may be confidently assumed that the Commander-in-Chief has not professed inability to comply with a demand for reinforcements. There is for the moment no probability of an insurrection which would require suppression by regular troops. The rebels of the present day know that verbal treason and private assassination are safer and easier than armed insurrection. It is not known that any extraordinary precautions have been taken against the repetition of the crimes which are daily perpetrated. It is perhaps impossible, with the resources actually at the disposal of the Government, to protect all those who are threatened with violence or death; but the want of administrative vigilance, past or present, is in some respects highly reprehensible. It is stated, apparently on good authority, that a single gunmaker in Dublin has within a short time sold fourteen hundred Snider rifles, some of them with bayonets attached. All these weapons have been bought at Government sales, held in accordance with a perverse and contemptible rule of official parsimony. It is not stated whether such facilities for insurrection have been offered by the late or the present Administration. It is too much to expect that tradesmen, whether they are loyal or disaffected, should renounce the opportunity of profit; but it may be confidently asserted that no other civilized Government in the world, having to do with such a state of affairs as that which exists in Ireland, would place its magazines at the disposal of its enemies.

Muskets and bayonets cannot be required for any lawful or legitimate purpose. Every purchase of the kind is to the knowledge of the seller, of the buyer, and of the Government which looks helplessly on, a preparation for armed resistance to authority or for assassination; yet there is no law which prevents the acquisition or prohibits the possession of the known instruments of crime. Englishmen, who have among other immemorial liberties the right to bear arms, are not in the habit of converting their houses into arsenals. Statesmen who affect to rule Ireland according to Irish ideas at the same time consider it necessary that English legislation should be applied to a community which habitually defies the law. In preference to introducing any incident of the administrative system which is rhetorically described as a state of siege, the victims of cant justify CAVOUR'S boast in an inverse sense by consenting not to govern. One of the most obvious provisions of the special Acts under which Ireland has been governed for the greater part of half a century places obstacles in the way of the possession of arms, except with an official licence. As might be expected, no Arms Act has prevented the secret possession or the occasional employment of weapons for purposes of violence; but it at least renders impossible the public purchase by retail of muskets and bayonets. The more stringent enactments of Coercion Acts are not less urgently needed. Any humiliation which the Government might incur by summoning Parliament and demanding the necessary powers would be a trivial inconvenience in comparison with the evils to be remedied. On its accession to office the Government undertook with a light heart to disarm itself in the presence of formidable adversaries whom it vainly hoped to conciliate. If an excuse for inconsistency is needed, the Government may avow its disappointment at the recrudescence of seditious and murderous agitation. Any amount of simple-minded or hypocritical commonplace will be tolerated, if only the Government will at last prefer the public interest to its own. Mr. FORSTER will scarcely execute his conditional threat of punishing the landlords as a condition of repressing anarchy. When Mr. PARNELL quotes from Mr. GLADSTONE rhetorical statistics of eviction and its consequences, it may be taken for granted that he is unable to produce better evidence. It is above all things necessary that the Government should have the courage to silence the itinerant demagogues. Much may be done by direct action to check agrarian crime; but the license accorded to members of Parliament and ruffianly priests publicly to apologize for murder is a wrong even to their deluded adherents, who justly regard as powerless a Government which is afraid to defend itself and society.

ELECTIONEERING.

THE art of electioneering is as vigorous and thriving as it ever was. It consists in showering money on a constituency within or without the limits of the law. Money may be showered on a constituency within the limits of the law. Enormous sums may be spent in printing, placards, paid canvassers, and committee rooms. From this humble but expensive level the electioneering artist rises to the supreme height of illegal practices which entail a penalty on the offender but do not void the seat, such as payment of railway expenses to borough voters, and the provision of refreshments on the polling day. A step further is taken when practices are ventured on which will, if discovered, void the election, but which do not seem morally very wrong, such as payment to voters for loss of time in going to the poll, and hiring voters to aid in keeping the peace. Lastly, the art rises to its highest stage when corrupt things, known and universally recognized as corrupt, are done — when beer or money is given to purchase votes. There is no reason to suppose that corrupt practices prevail in the majority of constituencies. It is only in constituencies where corruption is traditional that it survives. But where it does survive, it survives without any abatement of its old force. If any one expected that the Ballot Act or the Corrupt Practices Act would have really stopped the traffic in votes he must own himself mistaken. It is not only in little places like Knaresborough, Evesham, and Sandwich that the old bad system of electioneering prevails. It is rampant in large and highly respectable boroughs like Macclesfield, Oxford, and Canterbury. In one way Macclesfield is the worst case as yet revealed; in another way Oxford stands preeminent. The two have about the same population, 35,000, and about the same number of registered electors, 6,000. Both therefore are important places with constituencies that might be thought large enough to ensure something like purity. And yet at Macclesfield bribery of a petty but extensive kind has gone on for years, at every election, Parliamentary and municipal, and both parties have been equally free-handed. At Oxford more than 5,000*l.* was spent at the last election by one party alone, and our old friend, the Man in the Moon, appeared on the scene with 1,000*l.* in his pocket, and having scattered it broadcast, disappeared with as much mystery as he came. All that is known of him at present is that he is an old gentleman with several names and no fixed address. He was paid to come by persons of the highest respectability. He came, dealt out his money to his subagents, stayed long enough to "see that they were doing "their duty," and went away. It is exactly the history of Bridgwater over again. But then Oxford is not Bridgwater. It is a large place; it is an historical place; it has been frequently represented by members of great eminence; it has a University in its midst to teach it refinement and morality. That a Man in the Moon should have been sent for to Oxford, and should have found no difficulty in getting rid of a thousand sovereigns in a few days, and that he should have been working for men who were the cream of local respectability, is as surprising and

as shocking as anything can be to those who know the history of English electioneering.

Some obvious, if unpleasant, lessons may be deduced from the disclosures that are now being made. The Ballot Act has failed to check corrupt practices, because experience shows electioneering agents that, as a rule, they get what they bargain for. Men who are illegally hired to do imaginary service get warmed into their work, and speedily become eager for the success of the party they serve, although at the outset they were quite indifferent which party engaged them. The majority by which Mr. HALL was returned at the last Oxford election surprised those who were working for him. They got not less, but more, than they had expected for their money; so that, from an electioneering point of view, it was well laid out, even under the Ballot Act. Neither morality, nor public spirit, nor fear of the law, places any great restraint on corrupt practices. Where party spirit runs very high, or where the traditions of the place make corruption seem inevitable, men in the highest local positions stick at nothing. The Oxford Conservatives, as their agent informed the Commissioners, were determined to win the May election "at any cost." The end of turning out Sir WILLIAM HARCOURT seemed so very good that it was held to justify any means. The candidates easily keep themselves perfectly innocent. They simply ask no questions, and, as an agent said at Macclesfield, they are told a couple of thousand is wanted as a beginning, and silently "draw their cheques like "men." Those who work illegally for them are liable to prosecution, but no one thinks of prosecuting them. Either the judges report, if a petition is successful, that there have been one or more isolated cases of corrupt practices, and then it seems idle to make a fuss about a trifle, or they report that corrupt practices have prevailed extensively, and then all offenders get off under the screen of a general indemnity. The worst that can happen to Oxford and Macclesfield is that the writs shall be withheld during the present Parliament. A writ for Norwich was withheld in the last Parliament; but at the recent election Norwich was allowed to return two members just as if nothing had happened. Little places like Knaresborough and Evesham may be disfranchised; but then they may find it hard to persuade themselves that they would not have been disfranchised in any case, not because they were corrupt, but because they were small. Then, again, the obligation to return the expenses to which a candidate chooses to say he has been put is purely illusory. There is no harmony between the sums really spent and those returned, and in one case the partner of a candidate ingeniously disguised a contribution towards new corrupt practices by treating the sums advanced as a supplementary payment on account of the preceding election. The only person who suffers if a petition is successful is the candidate, who loses his seat; and here possibly the very strictness of the law helps corruption. The law is very strict; and a candidate whose agent, as at Plymouth, commits one little indiscretion forfeits the seat of his principal. If anything illegal is done, and is discovered, the consequence is precisely the same whether what is done is very small or very great. If illegality is once entered on, it may as well be done on a large scale. What happened to Mr. HALL is exactly what happened to Sir EDWARD BATES. They lost their seats, and this was all, although the Man in the Moon came to Oxford, and one solitary fisherman had his day's wages at Plymouth. An electioneering agent, calmly calculating everything, may very easily come to the conclusion that, if he is in for a penny, he may as well be in for a pound.

But there is another side to the matter which is one of great comfort to those who do not go in for electioneering in its bad sense. If on a *primâ facie* view the judges do not believe that corrupt practices have prevailed, they will do everything they honestly can to relieve a suffering member from the taint of practices as to which it may at first sight seem doubtful whether they were corrupt or not. A remarkable instance of this has been furnished in the case of County Louth, the full report of which has just been published. Mr. CALLAN, having been defeated at Dundalk, started for the county over which Mr. SULLIVAN and Mr. KIRK were supposed to be going to walk quietly and comfortably. Mr. CALLAN was returned at the head of the poll, and Mr. KIRK, who was defeated, presented a petition alleging corrupt practices. There had been practices which looked as if they had been corrupt. Voters had undoubtedly received a moderate amount of refreshment; but, as Mr. Baron DOWSE explained, everything depended on the motive with which those refreshments had been given. To ascertain this Mr. Baron DOWSE started from Mr. CALLAN himself. He alleged—and no one attempted to disprove a notorious fact—that he had got no money. Over and over again Baron DOWSE congratulated him on this piece of good fortune. Mr. CALLAN was one of those empty travellers who are allowed to sing before an election judge. It was antecedently unlikely that a man who had got no money should spend improperly what he had not got. Still there was money spent in treating. It was a very modest sum certainly, being in all about 46*l.*; and 126 witnesses were called to show how this money had gone. Some of it had clearly gone in drink. At Ardee, for example, it was indisputable that half a barrel of porter was poured into a tub, and water put into it to make it go further; and that the people were, as Baron DOWSE describes it, "fed like swine out of that barrel, half porter, half water." But that this mixture was given does not show that it was given for a bad purpose; and the judges held, on a calm and fair review of all the circumstances, that it was only a legitimate effervescence of Irish hospitality. For the judges took into consideration, not only Mr. CALLAN'S circumstances, but Irish customs and Irish character. "I have too high an opinion of my "countrymen," said Baron DOWSE, "to think that their "votes could be influenced by half a glass of whisky, "or a whole glass of whisky. They are not a herd "of serfs coming in with a vote in their hand to "dispose of it for a pint of beer." Characters so noble might yield to very strong temptation, but not to 46*l.* distributed over all the thirsty souls of an Irish county. The conduct of the election was complicated by the arrival of a deputation from the Licensed Grocers' and Vintners' Protection Association, who worked in a general way for Mr. CALLAN, and who undoubtedly spent nearly 100*l.* —a vast sum, according to the standard of Louth. But Baron DOWSE held that they had very prudently spent the money on themselves, chiefly in imbibing what in that part of the world "is alleged to be champagne;" and this, if physically a corrupt practice, is not legally so. The judgment is very entertaining reading, and the difficult legal question as to what are to be the tests of a corrupt motive is treated in it with great acumen and clearness. For general purposes its importance consists in the protection it throws over candidates and their agents who have no wish and little means to do wrong.

DIPLOMACY AND SOCIAL SCIENCE.

THE Social Science Congress has this year found a not uncongenial home in Edinburgh. The capital of Scotland is in many ways suited for the purposes of such an assemblage. For, although the wilder crotchets which are periodically aired on these occasions cannot hope to find much countenance from the sober inhabitants—at least as some count sobriety—of the city that is guarded by Arthur's Seat, the subjects with which the Congress mostly occupies itself are dear to all Scotchmen. Any stern and wild Caledonian will expound for hours in the Education Department the excellences of the system which appoints a Professor to teach the rudiments of Greek to several hundred young persons between fourteen and seventeen, and will point out at equal length that a certain Principal was a traitor when he hinted that more grammar schools of the English type would not have done Scotland much harm. Sanitary subjects and Edinburgh may seem by a time-honoured tradition of joking to be rather wide asunder; but the Art Department will be at least comforted by the existence of a gigantic gallery set apart for the purpose of welcoming and housing the triumphs of Scottish art when they are produced. If the various Sections are not quite so commodiously and centrally lodged as they can be in some of the large towns where modern Town-halls have given unusual facilities, their several homes are of considerable interest. It is perhaps a mere coincidence, but certainly an odd one, that the Art Section should be housed in the assembly-hall of the established Kirk, the very citadel of that denomination which, not so very long ago, as a whole regarded, and still probably in great part regards, poetry and painting as idle waste of time, music as something worse, sculpture as inherently indecent, if not im-

pious, and acting as something too dreadful to be named. But the great advantage of Edinburgh is that there will be plenty to do for the vast majority of the visitors whose enthusiasm for papers and discussions is after all but lukewarm. Elsewhere reliance must generally be placed upon organized excursions for relaxation and refreshment. Edinburgh is one of the few towns within the limits of this island which of themselves give an intelligent person sufficient delight if he merely wanders about them and looks at what they have to show him. Nor is the memory of BROUGHAM absent for pious Social Scientists—of BROUGHAM who is at once inextricably associated with Social Science and with Edinburgh.

The Presidential address of the year had at least this merit, that it was original, and it seems to have pleased some critics as little as originality usually pleases them. It has been asked what diplomacy has to do with social science, and the answer that there is a department of Jurisprudence and International Law in the Social Science Congress itself does not seem to have suggested itself to the questioners. The usual Presidential address at these meetings is a more or less faithful echo of the old Broughamite cacklings about useful knowledge and progress, with a certain admixture of desultory comment on something or other which is supposed to be connected with social science. Now, as many years of Congresses have not availed to draw up a definition of what social science is, it is scarcely surprising that the subjects which have seemed to successive Presidents to be connected with it are very wide and very miscellaneous. Lord REAY, however, who took a subject really connected with the actual programme of the meeting over which he was called to preside, has been rebuked for travelling beyond its province. This is perhaps the way of the world. But it ought in fairness to be remembered that the speaker had some special authority for speaking as he did on diplomacy and on the general relations between England and the rest of the world. Lord REAY happens to be not merely a diplomatic expert, but one of the rare persons who are by natural conditions cosmopolitans. The curious accident which makes him belong half to England and half to the Continent must have given almost any one but a very stupid man an advantage in looking at international questions, which pure Continentals or pure Englishmen, even if they are by no means very stupid men, would have some difficulty in attaining. Now Lord REAY's address on Wednesday proves him to be by no means a stupid man. His contrast between the attitude of Englishmen and that of foreigners on certain large political questions was extremely well put, and showed not a little insight into the subject. It exhibits with remarkable clearness the extreme suspicion with which a concert of Europe on any given question ought to be regarded, and the radical divergence of views, interests, and conditions which exists between England and most, if not all, Continental nations. This exposition is the more remarkable because we believe we are not wrong in assigning Lord REAY to the Liberal party in English politics, and his testimony might therefore be supposed likely to tend the other way. That there is not the least need for England to be on her guard; that her interests and those of all her neighbours far and near are quite identical, or easily identifiable; that no one of these neighbours is at all likely to harbour private or sinister designs; and that England may safely reconstitute the map of Europe to the advantage of any of them, except Austria, are the cardinal principles of Mr. GLADSTONE's foreign policy. The whole tone of Lord REAY's address goes to demolish these principles. Foreign diplomacy, says Lord REAY, is simply "realistic"; that is to say, it cares not one straw for treaties, or sentimental obligations, or anything but the two great motives—the hope of gain and the fear of loss. Arbitration is a farce; for on questions of real importance you can neither get your code, nor your judges, nor, most important of all, your sanction. The very outlines of the ideals of political well-being are differently drawn in England and abroad, so that there is no community of principles to go upon. It must have shocked many of Lord REAY's hearers not a little to hear from his lips the terrible word "ascendency," and to know that he considers the maintenance of a certain ascendency by England, if only one of a moral kind sufficiently backed by physical force ready to be used, to be indispensable to the welfare of the State. It is true that the latter part of the address was in some sense a contradiction of the former. For Lord REAY went on to say that the concert of Europe, which he had shown to be well-nigh impossible, must still be aimed at; and he indulged in dreams of a kind of Anglo-Australian, and perhaps American, federation which was to be the refuge of the destitute, and the counterpoise to the self-seeking of the Continental Powers. But the general tenor of the address was sensible enough, and the electors of Midlothian, who were doubtless present in some numbers, must have felt their ears rather tingle at it.

Objection seems to have been taken to all this as too definitely political for a Social Science meeting. A technical answer to this objection has already been given. But, as a matter of fact, there is an answer much more cogent, though less complimentary to the Social Scientists. This is that, as the widest license of chatter is allowed to them or assumed by them on subjects which are neither of interest nor of importance to any rational human being, there surely should be some license of talk allowed on subjects which are not merely important and interesting, but which are burning questions of the time. The proportions of the ideal cinder-sifting apparatus; the question whether a child ten years old ought or ought not to be able to enumerate the chemical constituents of water; the question whether municipal bodies should limit their patronage of art to the ordering of portraits of mayors, or whether they should fresco the council chamber with scenes from early chronicles and romances, are perhaps matters worth talking about. But, if so, why not questions which involve the very existence of the nation? Certainly a Social Science Congress is not an ideal opportunity for such discussions. It is by no means a collection of the wisest, and a flavour of fussiness, not to say folly, has generally pervaded its transactions. To the student of human nature it is safe to say that one visit at least to its gatherings is an indispensable condition of full equipment for his task. Days may be spent with profit and delight in observing the curious types of speakers and readers, the little displays of personal character in the Presidents of the Sections, the extraordinary jumble of classes and kinds at the conversaziones, the oddities of the personally conducted excursions. But, considering that among the crotcheteers and idlers some men of more or less eminence occasionally appear and speak, it would be odd if every now and then an idea worth saving, a phrase worth taking down, did not emerge from the mass of commonplace thought and slovenly diction. Lord REAY's speech seems to have opened the Edinburgh meeting in this respect in a rather promising way. We wish he had not asked us to "invigorate the social system," because it reminds us, in the first place, of a certain vague and vulgar advice to "preserve the elevation of your pecker," and in the second of Mr. BRADLAUGH's favourite *nunc dimittis*, "The social system keep in view." But perhaps a President of a Social Science Congress cannot avoid these little concessions to the jargon of his tribe. Nor are we altogether inclined to admire the statement that "the Anglo-Saxon world is a planetary system of itself," though this, too, for aught we know, may be socially scientific. But the plain demonstration of the attitude of Continental diplomacy by a man who knows what he is talking about, and the plain recognition of the impossibility of fads about arbitration and common interests, would have redeemed more faults and worse faults than these.

LORD SHERBROOKE ON OBSTRUCTION.

IN his essay on Parliamentary Obstruction in the current number of the *Nineteenth Century*, even Lord SHERBROOKE, though he says much that is sound, has failed to say anything new. By an odd deviation from his own consistency in paradox, he contrasts the errors of a mechanical age with the more practical proceedings of a nation which knew little of science and nothing of civil engineers. The water-clock of the Athenian Assembly was, as he says, a rude contrivance, but it effectually limited the prolixity of speakers, even when they were the greatest orators whom the world has ever known. "We make better clocks than those poor Athenians did two thousand years ago, but we have not, it should seem, learned to estimate as well as they that which

"the clock measures, the inestimable value of time." It is pleasant to find that an accomplished scholar can for once waive the opportunity of taunting his equals with their hopeless inferiority to constructors of railways and bridges. It is, as he truly says, one of the evil results of obstructive garrulity that thought, reason, and eloquence are too often reduced to silence in the House of Commons. "The men best worth hearing are now un-"willing to speak, partly because they are reluctant to "prolong a debate which is sure without their aid to be "stretched to the utmost limits of human patience, partly "because they recoil from a debate which is like an un-"weeded garden—things rank and gross in nature possess "it merely—partly because they feel keenly the wicked "and wanton waste of public time, and are unwilling to "add their sum of more to that which they already feel "to be far too much." The only remedy which Lord SHERBROOKE can suggest is the introduction of the French compulsory stoppage of debate, or of the American previous question, which has nearly the same effect. The majority must, in Lord SHERBROOKE'S opinion, exercise absolute control over the order of debate. The House would be consulted if any attempt to speak against time were made, and the nuisance at once put down.

When Mr. LOWE was in office, he sometimes irritated private members by assuring them that nearly all the time which they occupied with motions and debates was absolutely wasted. The financial and ordinary business of the Government was, as he contended, entitled to precedence, because it was essential to the conduct of administration. Next in order came legislative measures proposed by Ministers, because few other Bills were likely to pass. For the impatient ambition of non-official members the then Chancellor of the Exchequer was not sufficiently careful to conceal his contempt. He may perhaps occasionally have provoked the excessive volubility which, according to his statement, took its origin in the latter days of the former Liberal Government. There is no doubt that at that time some Opposition speakers performed with excessive zeal the duty of attacking the Government on every possible occasion. But it is not certain that their object was to waste time; and Lord SHERBROOKE weakens the force of his strictures on obstruction by including in indiscriminate censure a host of young Conservative members and the Home Rule faction which under the next Administration deliberately attempted to prevent the House of Commons from transacting any kind of business. Only a few days ago Mr. PARNELL, at one of his Land League meetings, avowed the object and method of his own system of obstruction. "There was a party," he said, "of independent opposition in the House of Com-"mons, pledged, if necessary, utterly to disorganize and "interfere with every business that might be transacted, "as far as it was expedient or possible." Nothing of the kind was ever professed or attempted by the Conservative members whom Lord SHERBROOKE thinks fit to denounce. With irrelevant partisanship, Lord SHERBROOKE remarks that Mr. BUTT, who was the leader of the Home Rule party, had formerly been a Conservative. When he undertook the ostensible task of proposing the establishment of an Irish Legislature, Mr. BUTT had wholly dissolved his former party connexion; and for the purpose of the argument it was immaterial to inquire whether he was a Conservative, because he never practised nor encouraged obstruction. Before his death the more violent section of his nominal followers had repudiated his authority, and there is no doubt that, if he had lived two years longer, he would have been formally deposed. Mr. BUTT's faults were not those with which Lord SHERBROOKE is at present concerned. Whatever may be thought of his character and career, he possessed cultivation and intellectual power which would have made the task of talking against time repugnant to his taste and inclination.

Mr. PARNELL and his adherents are, within or without the House of Commons, beyond the reach of argument and remonstrance. When they intentionally interrupt debates, when they keep their opponents sitting up all night, when they exhibit their peculiar manners by bringing food with them into the House, they display an impudence and a disregard for constitutional liberty of which there is no former precedent; but they are more innocently employed in impeding Parliamentary business than in promoting the murder of Irish peers and Irish process-servers. A civilized community may exist without Parliamentary discussion, but not in the absence of security for life and property. It is probable that the execution by Mr. PARNELL of his threat of annoying the Liberal Government by the same methods with which he harassed their predecessors will render necessary some measure of the kind which Lord SHERBROOKE unwillingly recommends. It is not to be supposed that six hundred members of the House of Commons will permanently submit to the dictation of the remaining fifty or sixty; yet it must be remembered that in the worst cases obstruction has been supported by a few English members, including more than one member of the present Government. The House of Commons may perhaps devise new methods of silencing contumacious speakers, but the promoters of obstruction will even in their defeat have achieved part of their object by obliterating the ancient securities for Parliamentary freedom. The precedents which are cited by Lord SHERBROOKE are not wholly unobjectionable. The power of closing the debate has apparently not been habitually exercised in French Assemblies, except for the purpose of bringing on a division when it is considered by all parties convenient and seasonable. The American system of the previous question was greatly abused when the Republicans some years ago had undisputed control of the House of Representatives. The misdeeds of a small obstructive faction must not blind prudent legislators to the possible tyranny of an irresistible democratic majority. Lord SHERBROOKE has not forgotten the fatal promise, which will soon be redeemed, of admitting the mass of the county population to the exercise of the franchise. It is not improbable that the process of legislative change may be hereafter too rapid rather than too slow.

It is strange that so conscientious and consistent an opponent of democratic caprice as Lord SHERBROOKE should regard as a paramount advantage the provision of additional facilities for legislation. "We have passed two "measures of first-rate importance during the late Session. "How many might we have passed if we could obtain for "the purposes of real business one half of the time which "has been intentionally and deliberately wasted." Four Bills of great importance—the Burials Bill, the Ground Game Bill, the Irish Disturbance Bill, and the Employers' Liability Bill—passed the House of Commons, though, with the aid of Lord SHERBROOKE, one of them was rejected by the Lords. As the House also accepted without question a comprehensive scheme of finance proposed by Mr. GLADSTONE, it may be considered to have done enough for a Session beginning in June. No Government Bill seriously promoted was lost by lapse of time. It may be conjectured that Lord SHERBROOKE was not an enthusiastic supporter of one or two of the measures which were passed. In the next Session he will have the opportunity of considering English and Irish Land Bills which will scarcely coincide with his economical principles. The Census will perhaps furnish an excuse for deferring for one year more the revolutionary change of the franchise to which Lord SHERBROOKE for some years offered an honourable resistance. The actual majority is more impatient of opposition than any previous party in power; and, at the same time, members are more servile in obeying the mandates of their constituents. Lord SHERBROOKE calls attention to the uncontrolled sovereignty of the House of Commons, though he for the moment seems not to appreciate the dangers which it involves. The Athenians had not only water-clocks to limit the exuberance of orators, but writs or indictments for the punishment of demagogues who had carried unconstitutional laws. A Bill for the temporary or permanent abolition of rent might now be introduced and passed without risk of criminal proceedings against its authors. Impeachments are obsolete, even in the case of Ministers who acquiesce in the prevalence of anarchy.

SOUTH AUSTRIAN RAILWAYS.

RAILWAY returns are taken in England as the readiest and most accessible means of ascertaining how the general business of the country is going on. One line is looked to as the index of the iron trade, another as that of the amount which passengers can afford to spend on travelling. But it is not only the weekly fluctuations of traffic that are instructive. When at stated periods the whole operations of a great Company are summarized, groups of facts are brought to light which illustrate in many different and indirect ways the industrial progress of the

nation. When, for example, working expenses are compared with receipts, it may appear, as it lately has appeared, that a time of diminishing receipts may also be a time of diminishing expenses, because everything consumed can be bought at a less price. What applies to railways applies to the whole community, and it becomes evident that, while people generally are earning less, they are also paying less. There is evidently thus a mitigation of the distress that is stated to prevail. Of course every one knows in a vague way that prices have fallen, and that living has become cheaper; but the summary of the history of a railway for several months makes that definite which would otherwise be vague. It shows what, if a great number of operations are taken together, is the precise figure at which the reduction in the prices of articles of common consumption may be calculated. Then, again, if the capital account of a great Company is examined, we see on a scale which, if small as compared with the whole bulk of industrial enterprise, is still large enough to furnish a good example, what are the requirements of growing industry which active men with money at their command think must be met. A leading English Railway Company puts down extra lines of rail, thinks nothing of spending a quarter of a million on a new station, executes gigantic harbour-works, as at Holyhead, devises new steamers as at Folkestone, runs up a Gothic or Corinthian hotel as big as half-a-dozen inns of the old sort, and shows the public what in the future railway travelling is to be. Again, although in England the intrusion of the Government into the affairs of railways is much less active than in most Continental States, yet even here the Government acts on the railways to a degree sufficient to enable us to form some estimate of the effect of Government pressure on commercial enterprises. There may be a special tax on railways like the passenger tax, which the Government may be disposed to levy with greater rigour than has been previously customary, and the returns show what is the effect of the screw being put on. The Government, too, insists, in a fitful and not very efficacious way, on certain precautions being taken for the safety of the public, and so far as railways adopt these precautions we can learn the cost of adopting them. The greater the traffic the greater is the need of precautions being adopted, and we thus arrive at some notion of the limitations of profit and of the causes which prevent a big business being good in proportion to its bigness. There may, too, be a general measure passed like the Employers' Liability Bill of last Session. How it will really affect employers is a most interesting question, as to which no one can as yet do more than guess. Even after it begins to operate, it will be hard to judge of its general effect. We shall hear of this or that employer being made to pay; but it will be difficult to form any opinion how far the class of employers to which he belongs may be suffering, or may be avoiding suffering by greater watchfulness. In the case, however, of those vast employers, the Railway Companies, we shall know to a penny what they pay, and if their payments under this head diminish, we shall know the exact pecuniary value of increased vigilance.

What is true of English railways is true in a greater or less degree of Continental railways. There is no better means of ascertaining what is going on in a foreign country than to study the report of one of its leading railways It is impossible to read such a report without getting some light on points so important as the current state of business, the general scale of prices, the preparations being made for future business, the pressure of the Government on industrial enterprise. The Report of the South Austrian Railways may serve as an example. The Company to which these railways belong had until lately two great systems, one in Austria and one in Northern Italy; but it has sold its Italian system to the Italian Government for a fixed annuity, and all that the Directors have to report as to this portion of the undertaking is that they cannot get some of the minor questions attending the purchase finally settled, because Italian Ministries change so fast that as soon as they begin to write to a Minister they are told he is out of office and they must address their letters to a new man. Their Report therefore deals with Austria only, and gives a report of the operations of the Company in Austria in 1879. There was, on the whole, a slight increase of gross receipts. In one direction a diminution had to be met. In the preceding year the occupation of Bosnia had caused a great but temporary increase, and in 1879 this traffic had come to an end. The weather of last year was bad, and the Company had to lament the falling off in tourists which was inevitable in a wet summer. But the growth of business on the line from Vienna to Trieste more than made up for these shortcomings. The principal articles which contributed to this increase were wines, building materials, and petroleum. The exportation of wine from Hungary to France was favoured by the bad French crop; and it is not uninteresting to learn how, even in bad times, the French manage to supply us with the Gladstone Claret we love so well. At Vienna building operations were being carried on with great activity, and this caused a vigorous movement in the transport of all kinds of material. The use of petroleum seems rapidly increasing in Austria, and the Railway Company introduced through the two ports of Fiume and Trieste one-half of the whole amount consumed in Austria and Hungary. The harvest was very bad, and this caused a general depression of business in the last half of the year. But still the increase in the new departments of traffic more than made up for the falling off in the old departments. Then, on the other hand, while traffic had on the whole increased, the expenses of working it had diminished, and by very nearly the same amount—something under 40,000*l.*—so that the total net revenue showed an advance of nearly two millions of francs, or 80,000*l.* It was the fall in the prices of articles of consumption, and the more skilful employment of materials and workmanship, that made this diminution of expenses possible.

Besides the general indications of the future of Austrian business afforded by the statements as to building in Vienna, the use of petroleum, and the shipping of Hungarian wine, the Report shows in what ways the Company is busying itself with the means of accommodating or stimulating business. It has finished laying a double line of railway from Vienna to Trieste, which may not seem a great feat to persons accustomed to English railways, but which in a minor Continental line shows a conspicuous advance. It has set up rolling mills of its own, and last year produced 10,000 tons of steel rails; and it can now make for itself all the materials of permanent way it needs, not only rails, but nuts and bolts, points and switches. It still, however, has to buy the new rolling-stock it may require. At Trieste it is busily engaged in providing increased accommodation by erecting new buildings, dredging the harbour, and constructing docks; and it may be noticed that the vast and increasing importance of Trieste to Vienna is a fact of very considerable importance in European politics. The pressure of the Government on the enterprise has shown itself in a manner highly disagreeable to the Company. For many years the Austrian Government has forborne to exact Income-tax from the Company. Every effort has been made to obtain a prolongation of the exemption from the tax; but the Government was inflexible, and from the 1st of January, 1880, ten per cent. Income-tax will have to be paid. The Company pays no dividend on its shares; but if it could pay a dividend, ten per cent. of its net profits on the Austrian part of its system would have to be deducted before the shareholders were paid. The interest on its obligations is, however, met out of its receipts, and after every expense, including that of the interest, had been met, there remained 150,000*l.*, which was carried to a reserve fund. A small part of the obligations of the Company are 5 per cent. obligations, and on these the Company will, according to the terms of its contract with the bondholders, pay Austrian Income-tax without being able to recover it. But on the great mass of its obligations, which are 3 per cent. obligations, it will recover what it pays to the Austrian Government, and, both the Italian and the Austrian Income-tax being taken into account, it will henceforth pay 13 instead of 15 francs yearly on a bond for 500 francs. This is a loss to the bondholder, not to the Company; but the Company will not entirely recoup itself for all it pays on account of the bondholders, and its net profits will in future be subjected to a heavy deduction. The effect, therefore, of this new pressure of the Austrian Government will be to postpone the date when the Company will pay dividends, and to lessen them when they are paid; and, although the Austrian Government may have been quite right in deciding that the

exemption should cease, the shareholders have a less bright prospect than they might have hoped for when they looked only to the increasing traffic and diminishing surplus of the Austrian lines.

JUVENILE CRIMINALS.

SIR WILLIAM HARCOURT'S letter to the Mayor of MANCHESTER would be pathetic if its complaints were only a little more accurate. "In dealing with a matter of "this kind it is," Sir WILLIAM thinks, "impossible to "escape misunderstandings and even misrepresentations." The HOME SECRETARY certainly can speak with authority as to the facility which some persons find in misrepresenting their fellow-creatures, and after his correspondence with Mr. WATTS HALLEWELL he should also be a very fair expert in the matter of misunderstandings, at least as far as the law is concerned. However, Sir WILLIAM comforts himself by the thought that his is the fortune which "attends all serious reforms." The melancholy, broken only by fits of ardent reforming, which seems to have fallen on Sir WILLIAM since his supporters were outbribed at Oxford is touching enough. "When CLIFFORD cannot spare his friends a ——" characteristic expression, everybody knows the conclusion to be drawn. There is, however, one point on which even such a chastened worm as the right honourable member for Derby will turn. He has seen it stated that he had sent "a general circular to all the magistrates "desiring that no child under fourteen years should be "sent to prison." Sir WILLIAM is very anxious to prove that he did nothing of the kind, and, indeed, we fully acquit him of any such thing. His direct fault, as far as we have seen it or commented on it, is that he has recklessly reversed certain particular decisions, and has invited certain particular magistrates to break the law by inflicting illegal penalties. His indirect fault is that his action has led other magistrates, who naturally do not wish to expose at once themselves and the law to the indignity of having their sentences interfered with, to relinquish the only effectual means which the law puts in their power of checking juvenile criminals. We do not observe that he controverts any of these facts, or attempts to deny the mischievous effect they have had. Therefore we are not concerned to take any further notice of his interesting act of self-sacrifice, as certain religionists would call it. Sir WILLIAM HARCOURT is certainly a surprising addition to the noble army of martyrs or confessors; but, if the attainment of some better system of punishment for youthful offenders is only to be bought at the price of his enrolment in the Calendar, we at least have not the slightest objection to the proceeding.

The meeting at Manchester which was held on Tuesday to consider the whole question was a much more important incident in the discussion. Lord DERBY was the chief speaker, and, whatever political objections may be taken to Lord DERBY, every one acquainted with the subject will admit that the LAUREATE'S line, "A quarter "sessions chairman, abler none," eminently applies to him. Lord HOUGHTON, who has in Parliament taken a very prominent part in legislation, or attempted legislation, on the subject, followed, and several local magnates, including the Bishop of MANCHESTER, swelled the voice of the meeting. Not the least significant statement made was one read from a letter written by Mr. KYNNERSLEY, the stipendiary magistrate of Birmingham. Mr. KYNNERSLEY remarked that girls gave little trouble to magistrates, because in case of offence people, instead of prosecuting them, simply turned them out of doors without a character. In other words, a much smaller proportion of juvenile criminals belong to the one sex than to the other. Yet we can hardly be mistaken in thinking that the average female criminal, even though she may have escaped what is in some quarters regarded as the indelible stigma of a sojourn in prison at an early age, turns out worse than the average male. This of itself would seem to show that the mere abolition of imprisonment will not solve the difficulty. Into this difficulty Lord DERBY entered at some length. He joins issue with those who hold—the HOME SECRETARY being to all appearance one of them—that a good sound flogging is an almost universal remedy for boyish wickednesses. Part of what Lord DERBY said was characterized by his usual impassive common sense. He pointed out shrewdly enough, but probably to the disgust of some of his new Radical allies, that in the present age of shrieking, a single excessive flogging reported in the newspapers would probably lead to an agitation which would do away with a very useful punishment altogether. There can be no doubt of the fact, and it may be commended without further comment to the admirers of democracy, as the remark of one of whom, for a couple of years at any rate, they have not been able to speak favourably enough. It need only be added that the subsequent speech of Mr. AGNEW justified to the full Lord DERBY'S disagreeable hint. But we are very much disposed to differ with Lord DERBY as to his remarks about the inequality of corporal punishment. Of course there is an inequality about it, as there is about every kind of punishment that can be imagined. A night's solitary confinement without the power of summoning anybody would be to one child—even to one full-grown person—an exquisite and horrible torture, to another simply no punishment at all. Incarceration among criminals would in the same way be to one person, old or young, an indelible stigma, to another no more of a trouble than a sojourn at an uncomfortable hotel. No legislation can possibly provide for individual differences of this kind. But, as against Lord DERBY, we are inclined to think that for children between seven and fourteen or thereabouts corporal punishment, neither of excessive severity nor of excessive mildness, is about the most equal of punishments, and we feel certain that all qualified schoolmasters who have not been bitten with the ridiculous mania about personal dignity will bear us out. As for that mania, it is enough to say that the proudest classes of the very proudest nation that ever walked on the face of this earth have for centuries been accustomed to such punishment in youth. As for any other considerations, it is sufficient to say that, if the gaol or police surgeon did his duty, no harm could possibly arise. Magistrates, except in the imagination of halfpenny Radical papers, are not, as a rule, fiends or fools, and generally take a great deal of trouble about their work; and we do not believe that, with the inevitable margin for accident, a large extension of the present laws authorizing corporal punishment would result in the slightest mischief.

No one, however, in his senses would recommend thrashing to the end of the chapter; because the penalty, though the most effective of all in its way, is perhaps the most likely of all to lose its force by repetition. There remains, therefore, the great Prison *v.* Reformatory debate, or rather the debate on Reformatory *v.* Reformatory preceded by Prison. The sentiment of the Manchester reformers, which Lord DERBY seems to a certain extent to share, is strongly in favour of the elimination of the prison stage altogether. We cannot quite concur in this. It must be remembered that the Reformatory system, occasionally admirable in its results, and occasionally very much the reverse, is in theory a very difficult one to defend. The State assumes a sudden guardianship of the individual—for whose good? If merely for his own, the inevitable difficulty which long ago puzzled Mr. CARLYLE arises. Why are scoundrels and the children of scoundrels to have this infinite advantage over honest children, the sons and daughters of honest men and women? We do not, perhaps we could not, make the parents of Reformatory children pay their expenses, and when we have made ratepayers or taxpayers pay them, we exact no kind of equivalent. It has been proposed that such an equivalent should be found in some years' compulsory service in the army; but to this, though there may be some not inconsiderable advantages about it, there are still more obvious objections. We want to make the army popular and respectable; and it certainly, according to modern ideas, is scarcely a reasonable way to go to work, to begin by sending more or fewer recruits into it with the brand of a kind of modified galley-slavery on them. On the other hand, it must be remembered that in the event of the establishment of corporal punishment as the almost invariable penalty (subject to the discretion of the magistrate) of a first, and perhaps of a second or third, offence, sentences of imprisonment, when actually passed, as we think they should be in the second stage of guilt, would deal with criminals who were to a certain extent hardened. The complaints now made about stifling innocence in its cradle, or whatever the phrase is, would have no application. At the same time, the penalty applied would be of a new kind,

and could be made sufficiently terrible. Hard scant diet, no amusements, and solitude for the whole or the greater part of the time are quite sufficient to produce a considerable impression on the youthful mind. If in its turn this proved useless, then there would no doubt be nothing for it but the Reformatory. The community would then be confronted with the fact that the small person before it was incorrigible by ordinary means, and that it must, at no small trouble and expense, take him or her in hand and endeavour by the only means left to turn the wastrel into a not wholly unprofitable citizen. But even then the assumption of such a duty by the State has so much in it that is unreasonable in itself, so much more that is incompatible with the whole system of modern social arrangements, that it ought to be resorted to with considerable reluctance. Not a few arguments of the ultra-reformatorians at Manchester and elsewhere are reducible to the very simple proposition that it is the duty of the State to supply the place of the parent in every instance when that parent is unwilling to perform his own duty. The position is, of course, an intelligible one; but we should like to have it clearly stated for acceptance or rejection.

THE DECAY OF ROMANCE.

THE austerity of the *Nineteenth Century* is relieved this month by Mr. Walter Pollock's lively article on Alexandre Dumas—the great novelist, not the immense moralist, his son. Mr. Pollock's paper is full of amusing *Dumasiana* and anecdotes of the author of the *Three Musketeers*. The criticism chiefly illustrates that wonderful exuberance, rapidity, and vivacity of good-humoured fancy which made perhaps the best part of Dumas's talent. There never was an imagination so fertile in resource and in invention of situations. Dumas could not be dull; he could not tell the simplest anecdote without making his characters live and supplying them with what lady-novelists would call a wealth of dialogue. There is something melancholy in the contrast between his successful audacity, his luxuriance of ideas, his prodigality of incident, and the timidity of modern novelists. What has become of the old melodramatic vein in fiction and the drama? Why does no one any longer dare, or why is no one any longer able, to lend us panting at the heels of adventurers like Porthos, Athos, and Aramis? What has become of romance, in short, and why is a good stirring tale of cloak and sword, of battles and escapes, so rare in modern English fiction? Have captive maidens, and injured virtue, and gallant chivalry ceased to interest, and does ferocious and picturesque villany slumber in the tomb of Front de Bœuf? These things are, and always have been, the staple of romance and melodrama. If they are out of fashion, it is only for the moment, and perhaps the prevalent taste for analysis, perhaps the whole "psychological" school of novels, may prove to be evanescent.

The fiction of all times down to our own was really in the melodramatic style. The ancient Greek novels were anecdotes of adventure strung on a slender thread of love story. Hero and heroine were constantly in the direst straits, and exposed to all the tribulations from robbers, pirates, storms, and sea, and fire, which befel that old woman in *Candide* who was the daughter of a Pope. The action was always vehement, the situations were constantly changing, the interest of the reader was constantly on the stretch. The whole of literary experience proves that, though there is room for other schools of fiction—for the reflective, the humorous, the sentimental—yet stories of adventure have the most permanent hold on the taste of men and women. If we look below the level of the circulating library, we find that the novels of the class which does not read the *Nineteenth Century* are all romances. No hero need apply who is not a true heir kept out of his own, or a foundling, or an earl in disguise; while the heroine, if she is not the lovely daughter of a duke, is the no less beautiful, and even more virtuous, progeny of a miller, or a stoker, or an honest but comic plumber. By aid of the passions of ladies and gentlemen living and loving in such social heights and depths, the author easily contrives situations such as rarely occur in common life. And this is the essence of romance. "Adventures are to the adventurous," wrote Ixion in the album of a goddess. But most of us, not being adventurous, like to have our adventures done by proxy, and love to read of what we are too respectable to undertake. Hence the popularity of romance, which gives to every subscriber to the *London Journal* many an hour of crowded life, while the family dinner is left to take care of itself, and the babies tumble downstairs.

The immense, the incalculable popularity of melodramatic romance among people who are not literary demonstrates the unaffected naturalness of the taste for tales full of adventure. In these, as we have said, the novel began, and it is only for a time, in all probability, that novelists can neglect the simple and effective systems of Dumas and Scott, and, on occasion, of Balzac. These two latter masters were, of course, much more than mere writers of romance. The humour and poetry of one, the science and analysis of the other, were often only additional ornaments to stories of romantic incident and situation. These great novelists knew that events and adventures are essential to the maintenance of any prolonged and popular interest in fiction. The taste, too, of the many men of action and of genius who have been great novel-readers proves that the love of romance is not merely the passion of nurserymaids and milliners. No one ever read more novels than Napoleon. He was difficult to please, and used to toss volume after volume out of his carriage-window, till the road from Madrid to Moscow was strewn with fugitive fragments of light French literature. It was adventure that he cared for, and it was the adventures that amused Macaulay, even in the silly story where he noted that the heroine fainted some twenty-nine times in the course of her passionate experience. Thackeray, too, who was not prodigal in incident, revelled in Dumas's tales; and, as Mr. Pollock remarks, paid them a very handsome compliment. Probably most people have observed in their own experience the voracity, unequalled by schoolgirl or sempstress, with which men of great mental force devour novels in their intervals of leisure. Gaboriau or Xavier de Montépin provides their favourite reading, and they live a kind of double life, at a tremendous pace, in the adventures of omniscient policemen, of prodigious villains, of dukes who have an unhappy knack of committing murders in low *cabarets*. This exercise of the fancy is found to be wonderfully restful and refreshing. Like the amusements of golf and lawn-tennis, it entirely abstracts the mind from the cares and troubles of the actual world, and may of course be enjoyed when physical pastimes are impossible or inconvenient. Now it is plain enough that the ordinary English novel, even when it is a good one, does not afford us this kind of relief. It does not rest the mind, nor remove the thoughts from the anxieties of every-day experience. The modern novel rather reproduces these, and, if a reader has a sentimental remorse or a sentimental sorrow (which few escape), recalls it to him or her, till the old wound throbs uncomfortably. There is an admirable study by Mr. Henry James, of a modern girl's heart, at present being published in a magazine, which is positively cruel. One might as well go to witness vivisection as read this story with the hope of getting away from this weary world and escaping into a realm of delightful romance. Dumas and Scott, and very few later writers, have "the key of the happy golden land" where more heads than hearts are broken, where the hero's intentions are strictly honourable, and his strength is as the strength of ten, while his enemies go down like ninepins.

What is the cause of the decadence of romance? It is unnecessary to repeat truisms about our introspective, scientific, analytic age. Science, analysis, introspection—these are our malady. There is another cause of the decline of stories of adventure. We have become very provincial, and are interested beyond all reason in the petty details of our own modern existence. Novels must be written, like newspaper articles, up to the newest fashions of the hour, and they are all the better liked if they contain some reference to contemporary scandal, or some personal satire on people of contemporary notoriety. Now the nineteenth century is not precisely an epoch of adventure. The novelists of the beginning of the age saw this, and they took refuge in the historical novel. When gentlemen wore swords and travelled on horseback, when highwaymen were common, and when the police force did not exist—still more when robber barons could carry off captive maidens to their towers—there was room for the romance of adventure. "Anything might happen under the Plantagenets," says Miss Braddon; and under the Tudors, the Stuarts, or at any time up to the French Revolution, there was ample playing-ground for the writer of fiction. But now the historical novel is thoroughly out of fashion. Perhaps the authors are partly to blame. They wore out their machinery. They would insist on beginning with a booted traveller who arrives at a hostelry and does ample justice to a pasty and a flagon of claret or a pot of sack. The love affairs became too obvious, the adventures were supplied at much too slight an expense of imagination. Then the historical critics of this iron time came down on the novelist. A German musical critic (of all people) has been known to remark that "Scott knew nothing of the middle ages." This kind of remark shows the nature of the critical spirit. An historical novel is read as if it were, or ought to be, as gravely learned as a treatise by Professor Stubbs. Indeed the young American reviewer who has recently "found out" the gross carelessness of the mere European Stubbs would not be at all satisfied with that measure of accuracy. Now novelists seldom know more of the middle ages than Scott did, and, being aware of this, they avoid that enchanted period in which cloaks and swords, witches, robbers, knights, and ladies passed through delightful adventures. To be sure some of our historians, in revenge, have many of the charms of style and all the freedom of fancy once peculiar to the novelist. Thus our science, and our love of modern gossip, which we call "realism," and our languor, and our dandified historical accuracy, all make against romance of the old exuberant sort. Among modern English writers Mr. Sheridan Le Fanu was almost the last who held his readers with the romantic spell. He had the art of making the blood run cold, and could render a "mad doctor" as terrific as any recreant robber knight. He had also the true daring, the well-directed audacity, of the romance-writer. The apparition of the devil in *Morley Court* is very well arranged, and recalls Wandering Willie's inimitable story in *Redgauntlet*. Speaking of this author reminds one that his *Uncle Silas* might be dramatized into a most powerful melodrama. The characters are strikingly marked. Mr. Irving, in

silvery locks, would make an admirable polite old murderer, with occasional bursts of passion. We can think of no lady on the English stage who has such natural advantages as Mme. Jonassain for acting the *rôle* of the grotesque French governess, but the part is obviously a telling one. The minor characters—Dudley, the bumpkin villain, and his sister—would be almost new to the stage, and the incidents, culminating with the terrific murder and the escape, are only too strong. But melodrama on the stage seems to be slumbering, like romance in fiction; and when it wakes it confuses itself with the "realistic" drama, and invites the public to go and see the very same machine as that which ought to have blown up the Czar's yacht, but has not—as yet. We are too intellectual and too languid to be thus easily aroused. So novelists and managers appear to think, though it is quite possible that a really good romance or melodrama might be as popular as ever.

GOTHAM-BY-LONDON.

IT is probable that even in the original Gotham the population was not exclusively composed of the "wise men," and therefore the inhabitants of the village of Tottenham need not feel individually affronted by the title which has been set at the head of this article. It must already have struck many persons that the book of the Chronicles of Gotham has lost considerably in interest and piquancy by the fact of School Boards not having been invented when it was compiled. As an ordinary Board is to an intelligent man, so is a School Board for the most part to an ordinary Board. But the Tottenham School Board deserves the credit of having added another step to the climax of proportion. As an ordinary School Board is to an ordinary Board of another variety, so, it would appear, is the Tottenham School Board to the rest of its kind. Perhaps it would be fair to take it as a sort of ideal School Board, a more exact copy of the archetype than has elsewhere been reached. Tottenham is already a place of some fame, though to most men it suggests only Tottenham Court Road (which, in truth, is a sufficient distance from it) and artistic furniture made by machinery. There is also the Tournament of Tottenham for those who happen to be imbued with literature. But, on the whole, like Gibbon in the matter of the pedigree of the house of Fielding, we should be disposed to charge Tottenham to consider its School Board as the brightest illustration of its history. In the order of nature, School Boards change their constitution, being altered by fantastic legal regulations, and by the caprice of their constituents; but it is obviously impossible that the inhabitants of Tottenham can ever have a better School Board than that which they now possess, or at least than the representative majority of that which they possess. There are spots in the sun, and there is a dark star among the Pleiades, nor do the members of the Tottenham School Board all shine with the same lustre. But the majority is, after all, the principal and master thing in these days; and the majority of the Tottenham School Board is beyond the reach of calumny. There are other majorities just now, in other deliberative and administrative bodies, which are also great and wonderful; but they are scarcely so great or so wonderful as the majority of the Tottenham School Board. This majority we now sing, or rather speak in plain prose, for reasons which Mr. Carlyle has expressed with excellent distinctness.

Within the jurisdiction of the Tottenham School Board is situated the Alexandra Palace, and at the Alexandra Palace many children of more or less tender years are employed, some in theatrical performances, some in other ways. This wickedness has attracted the wrath of Gotham, and the Clerk of the School Board has visited the Manager of the Palace, and has been "peremptory with him and passing short." The result of this was a letter which was read at the meeting of the wise men on last Thursday week. It has appeared in print, but cannot be too often printed for the edification of mankind. Thus it ran:—

SIR,—The Manager of the Alexandra Palace has given my three children, Elizabeth Vincent (12), Charles Vincent (10), and Thomas Vincent (5), notice to leave at once, and will not keep them on without a note from you. Would you please to let them stay three weeks longer, that I may get some money to buy them boots, otherwise they must go without them? I asked the Master of the Board School at Wood Green would he let the boy come half-time, but he refused. This I consider very hard. My husband has only earned 3*l.* in the last ten weeks. The children having been in private schools have not passed the Standards, otherwise I am sure they would be free.—Yours respectfully, JANE VINCENT.

The only comment necessary for the historical comprehension of this is that there is a by-law allowing half-time in the case of children "beneficially employed," if they produce certain certificates, which the little Vincents, having been under the instruction of no person qualified to give them, could not obtain. This and other formal information having been laid before the Areopagus of Gotham—as the Gotham reporters would very likely describe it—solemn debate was held. It is sad to have to record that the first note struck was one of weakness. Mr. Rees—a Vice-Chairman too—remarked that the Board might show a little leniency—as if leniency and School Boards had anything to do with one another. So, too, thought the Rev. Dr. Morris, whom, without the least authority to do so, we should much like to identify with the scholar to whom all students of English owe so much. The Rev. Dr. Morris appears to be a person singularly out of place among his colleagues, for he is not only a merciful man, but one endowed with practical good sense. He suggested that the three weeks asked for by Mrs. Vincent should be allowed, and that the Board should then do what it thought proper. At this point in the debate the wisdom of Gotham burst through the clouds which had obscured it. Mr. Robins "thought that it would be a very bad precedent." But whether he thought it a bad precedent that the youth of Gotham should be booted instead of bootless during the winter we are not quite certain. The Clerk "had known cases where the children were sent to work in order that the parents might remain idle; but he did not for a moment suggest that this was such a case." But Mr. Robins and the Clerk were soon eclipsed by the Rev. Mr. McSorley. We do not happen to know of what denomination the Rev. Mr. McSorley is an ornament; we wish we did. He thought "it would be a most disastrous thing, just after the Board got into working order, for them to begin to make concessions." There is a faint reminiscence here of the speech of another clerical gentleman famous in history, that learned clerk upon whom Mr. Pickwick was chummed in the Fleet, and who regretted the prospect of altering arrangements "just as they had got everything nice and comfortable." But Mr. McSorley had more to offer than this suggestion that, as the fists of the Board were in such capital order, it ought to pitch into somebody. He had special reasons. He had heard that "one young child came on as Mr. Gladstone, another as Lord Beaconsfield, and a third as Napoleon Bonaparte." Whether this trio is to be identified with the three little Vincents or not, Mr. McSorley did not say. If it be so, it would be interesting to know the distribution of the parts between Elizabeth, aged twelve, Charles, aged ten, and Thomas, aged five. However, the reverend gentleman had apparently no fault to find directly with the cast. He thought "they ought to be learning to spell, instead of being allowed to represent such exalted individuals, the doing of which would puff them up with such notions of their own superiority that they would come to the conclusion that they could do without education altogether." Mr. McSorley evidently has a very high idea as to the actor's faculty of identifying himself with the characters he represents. But his argument, looked at from another side, certainly amounts to *scandalum magnatum*, for it distinctly insinuates that Lord Beaconsfield, Mr. Gladstone, and Napoleon Bonaparte did without education altogether, which is not only injurious, but unhistorical. However, Mr. McSorley came down from these altitudes to a practical remark. He was "strongly opposed to the slightest leniency being shown in the matter." Boots or no boots, the three little Vincents should go to school, even though it was not in evidence that the two eldest at least were not sufficiently educated already. *C'était son bon plaisir.* Mr. Rees persevered in his ridiculous and maudlin appeals for leniency, but it was no good. The Tottenham School Board was true to itself, and Mrs. Vincent was informed that her children must go bootless, and that it was a high crime and misdemeanour for them to help their parents or themselves. Indeed the Rev. Mr. McSorley would probably say that six shillings a week, the average earnings of Vincent *père*, is ample for a family of five; there is a shilling a week per head, and an extra shilling for contingencies, including boots. To ask for more under these circumstances would doubtless be wasteful and "ridiculous excess," to use the words of an author who, from Mr. McSorley's point of view, has made thousands of persons represent exalted individuals to the great detriment of their moral tone.

Now we are by no means concerned to defend the principle of making children at an early age earn money, either by theatrical or any other performances. We had much rather that Elizabeth and Charles and Thomas (especially Thomas) were making mud pies, or diverting themselves in any other fashion delightful to childhood and revolting to persons like the Rev. Mr. McSorley. Further, it is to be observed that the augustness and importance of education are matters which do not enter into this question at all. No evidence was produced to show that the little Vincents were in such a state of ignorance as to be dangerous to the nation at large—we believe that is the argument—unless their brains were promptly filled at the expense of their stomachs and their toes. No evidence was produced to show that there was the slightest misconduct on the part of the Vincent parents. If any wicked literary person had produced Mrs. Vincent's letter, it would have been extolled as a triumph of art, and, as the Tottenham School Board's paid Devil's Advocate does not in the least impugn its facts, we suppose it may be taken as a triumph, not of art, but of nature. What the Tottenham School Board wish us to believe is that the law positively forbids them to exercise their discretion, which, if it did, it would perhaps in the circumstances as shown by this case be a wise law. Three weeks' absence from the invaluable instruction which, as Lord Norton tells us, eradicates the evil habit of speaking of white of egg and substitutes an elegant custom of saying "halbümen," is no doubt a grievous loss. But, considering the six shillings a week and the coming winter, it is just possible that men less wise and good than the Gothamites might have felt their bowels of compassion moved. But a School Board has no bowels, and in the case of this particular School Board the deficiency can hardly be said to be compensated by a superfluity of brains. For Mr. McSorley's great argument of precedent is, it is needless to say, mere nonsense. The very reason of a School Board's existence —if it has any reason—is that particular cases may be judged on their particular merits. To argue, however, with the Rev. Mr. McSorley would be as though one should present a pair of boot-

books to Master Charles Vincent. He would be a wholly delightful person, to be carefully cherished and preserved for a place in some new "Nest of Ninnies," if it were not for the awkward fact that the existence of the little Vincents is suggested by him. The virtue of the Rev. Mr. McSorley, his sternly logical mind, and his anxiety that a machine in such excellent working order as the Tottenham School Board should go to work vigorously, have deprived these young persons of boots, and have probably curtailed very considerably their rations of bread. It is rather hard that Elizabeth and Charles and Thomas should have to pay with chilblains and an aching void about their central regions for the addition of the Rev. Mr. McSorley to our cabinet of curiosities. He is a great addition, no doubt, and we can only suggest that he should be at once invited to join a company of New Testament revisionists. There are a great many texts which, on McSorleian principles, must be hopelessly wrongly rendered in the present Authorized Version, and his counsel and advice would be invaluable in the Jerusalem Chamber. To go from Christian to Pagan associations, we cannot help wondering what would have happened if Mr. McSorley's name had been Marcus Sorleius, and if he had lived at Falerii in the days of one Camillus. That Dictator would probably have furnished the little Vincents with large pairs of boots, well clumped and hobnailed, and would then—but the picture is altogether too shocking to complete.

AN EARLY ITALIAN GUIDE-BOOK.

IN the last years of the Commonwealth, or the first of the Restoration, one Richard Lassels "travelled through Italy five times," if we may take his word for it, "as tutor to several of the English nobility and gentry." His observations were copious and diligent, and were collected in the form of a book. For some reason they were not printed till 1670, after the author's death; and then at Paris, for reasons which are easily guessed when one has looked far enough into the book to discover that Mr. Lassels was a Romanist of the purest Ultramontane water. This, too, throws a light on his many journeys, which seem to argue what is likely enough in itself, that Roman Catholic noblemen and gentlemen in England then had but a limited choice of competent tutors of their own faith and country. The work is professedly a guide-book and nothing else, and must be a tolerably early specimen of its kind. Its full title is as follows:—"The Voyage of Italy, or a Compleat Journey through Italy. In Two Parts. With the Characters of the People, and the Description of the chief Towns, Churches, Monasteries, Tombs, Libraries, Pallaces, Villa's, Gardens, Pictures, Statues, and Antiquities As also of the Interest, Government, Riches, Force, &c., of all the Princes. With Instructions concerning Travel." The instructions are naturally something out of date; but the modern reader may extract a pretty good evening's amusement from the pages of this odd little duodecimo. Not that its amusing qualities are due to any particular merit on Lassels's part. Indeed it must be confessed that he is in the main a dull, frigid, and pedantic writer enough; and when he gets to the description of a city his passion for churches and relics amounts to a monomania. But he is laughable by his very gravity, and by a certain quaint incongruity of style. He affects curious and unaccustomed words; Campania is "autonomastically *felix*"; the Turks are "analphabet rogues"; a gentleman should acquire "a chironomy, or decent acting with his hands, which may humor his words gravely and freely, yet not affectedly or mimically." At the same time he is fond of proverbial and familiar turns of speech. He tells us that we may go to Italy "by land from *Lyons* through *Swisserland*, the *Grisons* Country, and the *Valtoline*, and so pop up at *Brescia*." We are still more surprised at coming on what we had innocently supposed to be a piece of quite modern slang. At Genoa Lassels makes mention of "the *Strada Nova* here, which for a spirt surpasseth all the streets I ever saw anywhere else for neatness and proportion; and"—he adds, as if to put his meaning beyond all possible mistake—"if it had but breath enough to hold out at the same rate a little longer, it would be the true *Queen-street* of *Europe*." Of the church of the Annunciation in the same city he says, in a graphic phrase which has now gone out of use, that it "draweth up the Ladder after it for neatness." Having thus met with "neatness" twice already, we may remark that "neat" is Lassels's favourite epithet. Marseilles has a most neat haven, and Zürich a neat arsenal; and by the time we come to Rome and St Peter's it is almost a surprise to find that something above neatness is possible, since "that noble structure" is described as not being "neat only, like a spruce gallery." "Neat," in fact, appears to have been in the latter part of the seventeenth century as general and serviceable an epithet in polite conversation, at least in the society frequented by Mr. Lassels, as "nice" is in the latter part of the nineteenth.

The general instructions, such as they are, are contained in "A preface to the reader, concerning travelling." There is an entire absence of the kind of information we nowadays expect of our guide-books as to prices, currency, modes of conveyance, and the like; but to make up for this there is plenty of moral disquisition about the uses of travelling. In the first pages of the book itself, however, some details of Italian manners are given, for the most part with the obvious intention of commending them as a model. Throughout the work, indeed, Italy is treated as the pattern and centre of the civilized world; and, after allowing for Lassels's Ultramontanism, his witness is still worth something as showing how powerful the tradition of the Renaissance still was. This saying is quoted, among other things, with the name of Charles V.:—"The French appear not wise, but are wise; the Spaniards appear wise, but are not wise; the Dutch neither appear wise, nor are wise; the Italians only both appear wise and are wise." If this is the true first form of the saying, and its origin is really Spanish, it is curious that the Dutch had already converted it to their own use with a changed intention; for, among the thousand and one proverbs, distichs, and so forth, collected in the works of Jacob Cats, a contemporary of Lassels, we find the contrast of nations in this form:—"The Spaniard looks wise, but he is not. The Frenchman looks a fool, but he is not. The Italian looks wise, and so he is. The Portuguese looks a fool, and so he is." There is a paragraph on the religion of the Italians which leaves no doubt as to Lassels's own persuasion. "As for their Religion," he says, "it's purely that which other countries call by the name Catholique, and which in England they commonly call the Religion of the Papists"; and he sets forth in a sentence long and clumsy even for him that well-instructed Catholics do not much mind being called Papists, as the name does not come (among other things) "from any Sectary meeting-place, as Hugonots from the Gate of Hugo in Tours in France, near unto which they met privately at first to teach and dogmatize." This derivation of Huguenot is not much worse than the more commonly known one from *Eidgenossen*. Quite lately the much simpler suggestion has been made, and is likely enough to be right, that it is nothing but a contemptuous form of Hugh; compare the Jacquerie, the English "Jack of all trades," "jackanapes," and the like, the Anglo-Indian "Tommy Atkins," and the use of Hodge as a typical name (though it is not really common) in a certain sort of English literature.

Before describing Italy itself in detail, our instructor gives a general view of the ways of going there. Once he went by Lyons and Marseilles, and by sea to Genoa. At Fontainebleau he was much taken with the "rare ponds of water" in which "are conserved excellent Carps, some whereof were said to be an hundred years old." He sees the fish fed, and moralizes over the struggle for existence. "Its an ordinary divertisement here, to throw an halfpenny loaf into the moat among the Carps, and to see how they will mumble and jumble it to and fro; how others will puff and snuff, and take it ill not to have part of it, and how, in fine, they will plainly fall to blows and fight for it. You would wonder how such hot passions should be found in cold water; but everything that lives will fight for that which makes it live, its Vittails." At Lyons one of the chief sights is "the rare Cabinet of Monsieur Servier, a most ingenious gentleman," containing a variety of those mechanical nicknacks which were so much to the taste of the time, such as "the Mouse-dyal, where a little thing, like a mouse, by her insensible motion, markes the hours of the day . . . . the Oval Dyal, in which the needle that markes the hours shrinketh in, or stretcheth out it self according as the oval goes." But still greater delight was found by Lassels in the artificial waterworks of Italian villas. He is never tired of the contrivances he calls "wetting sports," by which the weight of the unwary visitor, walking or sitting as the case might be, let loose a shower-bath upon him. Thus at Pratolino, near Florence, "you have the Grotte of Cupid with the wetting-stooles, upon which, sitting down, a great Spout of water comes full in your face. The Fountain of the Tritons overtakes you so too, and washeth you soundly." In the garden of Montalto at Rome "you see a round table of a blewish stone, upon which the arms of the house of Montalto are engraven, at which, while you gaze anxiously and near at hand, the gardiner, by pressing his foot upon a low iron pump under the table, presseth out water on all sides of that round table, and welcometh the strangers that come to see his garden"; and elsewhere in the garden there was other "store of wetting sports" not specifically described. The villa Aldobrandina at Frescati is extolled for "curious fountains, *cascatas*, and other delightsome waterworks"; and "the rare *cascata*" has a whole paragraph to itself. Evidently "cascade" did not yet exist as a naturalized English word; some other words, too, which we have imported from Italy, such as "cupola," seem to be regarded by Lassels as still foreign. "These waters also afford innumerable and inavoidable wetting places," and a great hydraulic organ ends its performance by "playing terribly" on the audience. It is curious to think of noblemen of classical education and polished taste filling their grounds with elaborate "booby-traps" for their guests—the childishness of the subject-matter must excuse a piece of school slang—and still more curious that it seems to have passed for an admirable combination of artistic and mechanical ingenuity with refined practical humour. But we have anticipated Mr. Lassels's course; we left him at Lyons. At Vienne he stops to repeat the legend of Pontius Pilate having killed himself there, with precisely the same matter-of-fact air and apparent freedom from doubt as his own observation of the lack of ornament in the Cathedral. This is but a mild specimen of Lassels's omnivorous faith; the utmost condescension he ever makes to scepticism is, when he relates anything peculiarly incredible, to vouch Baronius to warranty; the "omniscious Baronius," as he calls him, "who read almost all that other men had written, and wrote more almost than other men can read."

Another time Lassels, coming again by Lyons, made for Italy by way of Geneva and the Simplon. He speaks of the Lake of

Geneva as "absolutely the fairest I have seen"—for a wonder it is not "neat"—and he tells a curious anecdote of a stranger who in a hard winter rode several miles on the Lake, taking it for a large plain; and, on being informed of the truth, "reflecting upon the danger he had been in, fell down dead with the conceit of it." Cretinism was as rife then in the Valais as it has been in later times, if not more so; in Lassels's phrase, "they have many natural fools here"; he thinks it probable "that the climats that are most agitated with winds produce more fools than other Climats do"; an hypothesis which may have been founded on some crude physiological fancy of the wind getting into the brain. As to the Simplon when it served in its ancient estate of a bridle-path as "one of the great staircases of Italy," the journey appears to have been uncomfortable and the accommodation bad. Of Alpine scenery, it is almost needless to say, there is not a word in Lassels's account; it was not discovered for a good century after his time.

When we are fairly on Italian ground with Lassels, he becomes more prolix as he approaches Rome, and consequently less entertaining; once in the Eternal City, he drags us relentlessly through a bewildering catalogue of churches. He professes to be a scholar, but his scholarship was apparently neither exact nor brilliant. He quotes with only one remark the following epitaph on the English Cardinal Adam, who died at Rome in 1397:—

> Artibus iste pater famosus in omnibus Adam,
> Theologus summus Cardinalisque erat.

(*For*, *Fuit*, Lassels notes in the margin):—

> Anglia cui patriam, titulum dedit ista Beatæ
> Ædes Cæciliæ, morsque suprema Polum.

We need hardly point out to any of our readers that this versification goes near to excel in all seriousness any of the grotesque inventions of the *Epistolæ Obscurorum Virorum*. "Theologus summus Cardinalisque erat" may stand proudly beside "docti cucullatique viri." The inscription on the Columna Rostrata, which tells in honour of Duilius how "clases navales primus ornavet," and how he overcame the whole strength of Carthage "in altod marid," is petulantly dismissed—we crave pardon of philologists for repeating Lassels's bad language—as "scurvey old *Latin*." "I found," he continues, "it spoke of a Sea Victory wonn over the *Carthagenians*, and of *Duilius*; and I cared for no more, because *Livy*, in better *Latin*, tells me the rest." After all, one could hardly expect anything else from a generation of Englishmen who regarded Chaucer's language as unintelligible, if not "scurvey old" English, and thought Shakspeare already out of date. On visiting Cicero's reputed tomb Lassels delivers himself of an exceeding grievous conceit, which for its absolute badness deserves to be reproduced:—"There are no words upon his Tomb; of which if you ask me the reason, I can only tell you, that either words in prose could not speak, their *Tully* being dead; or verses would not, out of envy, praise him, who had made prose so famous." As a piece of deliberate and frigid bad taste this is indeed consummate, subtle, supreme, and whatever else of precious and exquisite laudation modern criticism has invented. Lassels's appreciation of works of art seems to have been much on a level with his scholarship. He bestows conventional praise on the works of the great Italian masters when they come in his way; but his heart was in "rarities" and waterworks, and still more in relics. He shows some curiosity about military inventions. In the Little Arsenal at Venice he describes a variety of strange firearms, and an armoury specially arranged for sudden alarms, with a contrivance for lighting sufficient matches for all the muskets at once. In the great arsenal a sort of chain-shot is spoken of, apparently as a new device; "a dangerous invention in sea battles to spoil cordage and tackling." Lassels's eyes found little time to occupy themselves with scenery, though Naples did make an exceptional impression on him. There he went up to the Carthusian monastery of St. Martin, and "had as fine a prospect as *Europe* can afford, not excepting that of *Greenwich*, thought by *Barclay* the best prospect in *Europe*." His knowledge of history and the manners of men in different lands must have been of a narrow sort, for when he visited a synagogue in Rome he was much shocked at the Jews keeping on their hats; "but," he adds, by way of accounting for this pretty well known point of Oriental observance, "they are Arch-clowns, and their fowl towels, at the entrance into their Synagogues, told me as much."

As for anecdote and incident, it would be difficult to find a book of travels more barren of them. The nearest approach to an adventure is the account of some trouble with Customs officers at Fundi, on a return journey from Naples to Rome, which is emphasized in the margin by the warning—"Take heed of the gabellers of Fundi." The Italian Governments of that day seem to have entertained grave objections—in consequence, no doubt, of the "mercantile theory" of the wealth of nations—to the current coin of the country being carried away by travellers beyond a small fixed amount. Lassels does not fail to draw a moral:—

> This is to learn my traveller to be inquisitive in all his journeys, of the Laws of the Country where he travelleth, especially such obvious ones as concern publick passages, bridges, ferries, bearing of arms, and the like; the knowledge of which customs will make him avoid many inconveniences, which I have known others fall into.

But the traveller is not the less left to pick up this knowledge as best he can. Nowadays we run into the other extreme, and for the most part are so puffed up with our guide-books as to disdain local inquiry altogether; whereby, if we do not fall into actual inconveniences, we lose many occasions of extending our knowledge of men and things. Of Montefiascone, "famous for excellent *Muscatello wine*," Lassels tells a story which we do not remember to have seen anywhere else, and which is a fair specimen of a mediæval Joe Miller; and as it is one of Lassels's liveliest passages, we will give him the benefit of concluding this notice with it. We have already seen enough of his spelling, punctuation, and italics, and therefore print this extract according to present usage:—

> This wine is famous for having killed a Dutchman here who drunk too much of it. The story is true and thus. A Dutchman of condition travelling through Italy sent his man before him always, with a charge to look out the inns where the best wine was, and there write upon the wall of the inn the word *est*, that is to say, Here it is. The servant coming hither a little before his master, and finding the wine excellently good, wrote upon the wall *est*, *est*, *est*, signifying thereby the superlative goodness of this wine. The master arrives, looks for his man's handwriting, and finding three *ests* is overjoyed. In he goes, and resolves to lie there; and he did so indeed; for here he lies still, buried first in wine, and then in his grave. For drinking too much of this good wine he died here, and was buried by his servant in a church here below the hill, with this epitaph upon his tomb, made by the same servant:—*Propter* est, est, est, *herus meus mortuus est.*

THE ROYAL UNITED SERVICE INSTITUTION.

THIS Institution, founded for the purpose of providing a professional home or centre where the two Services might meet on common ground, combining for the promotion of naval and military art, science, and literature, is about completing the fiftieth year of its existence. It will be interesting to inquire what progress it has made since its formation in 1831; whether it has fulfilled the objects of its foundation; and how its prospects look at the present time. To judge by the yearly average number of visitors, the home of the Institution in Whitehall Yard, despite its central situation, cannot be considered a popular resort. Indeed we believe its existence is unknown even to many Londoners. We might have expected that, with the prolonged successful extension of the Volunteer movement, and the consequent impulse given to the general cultivation of a patriotic tone of feeling, the Institution would have gained immensely in popular favour. More than this, we might have anticipated that the noise of the near thunder of war, bursting over neighbouring countries and rolling towards our own shores, would have led thousands of persons to take an intelligent interest in all that relates to our glorious naval and military traditions, and to the measures taken for their effective maintenance in the future. This has not been altogether the case. It seems to have been a mistake to suppose that the logic of the bitter lessons read to Austria and to France, and in a minor degree to Russia during the late war and to Turkey also, would be comprehended by the English people at large. It is scarcely too much to say that, looking at the number of professional subscribers to the Institution, the extent of sale of the journals published by its Council, and the average number of visitors, we can measure pretty accurately the interest taken generally in the great question of our day—namely, the condition of efficiency of our naval and military forces. We do not hesitate to call this *the* question of the time, because, though not so regarded by a considerable class in this country, it is abundantly recognized as such in other countries having less to lose than we have. Let us look a little ahead. Ten years have all but passed since the conclusion of peace between Germany and France. Before another decade has elapsed, should no great war supervene to disturb their calculations, the French will be found wielding —if we take into consideration their great and growing wealth—a more stupendous engine of war than it could have entered into the imagination even of a Napoleon to conceive. If peace is preserved, Russia will by that time be scarcely less formidable, at any rate by land; and Germany, if inferior to France both in the resources of her soil and as a naval Power, will, in the multitude and efficiency of her battalions, be quite on a par with either her Eastern or Western rival. We might go on to speak of Austria, or of Italy, but we have said enough. With each and all of these Powers the question of the day is, how many men can they turn into soldiers and sailors, and how can they best convert them into formidable instruments of war? With an influential section of our own community the question is very different. It is, how can we divest ourselves of our responsibilities? how can we save money? how can we substitute a cheap philanthropy for expensive patriotism? One of our ablest public men lately declared his conviction —and, we fear, with too much truth—that it would require nothing less than a national calamity to make us thoroughly realize the altered circumstances of nations, and the changed methods of war.

But, to come to the subject immediately before us, let us ask how is it that, after fifty years' important services rendered to the nation by the Institution of which we are speaking, that Institution is left almost entirely to support itself as best it can? The Government grant—only obtained in 1864—amounts to but 600*l.* per annum. Out of that some 205*l.* has to be paid for ground-rent, and 165*l.* for rates and taxes. Fuel, lighting, insurance, and repairs often swallow up more than the remainder of the grant; while the total annual expenses of the Institution, when other items of outlay are added, amount on an average to 4,500*l.* or more. Even the building itself the members only hold on sufferance. Though it seems to be an understood thing that they

shall not be turned out, they are liable to be ejected at a quarter's notice if the Government think they can find a better use for it. Notwithstanding the most urgent appeals, year after year, from the most distinguished officers of the two services for better accommodation—that now afforded being miserably inadequate—the Council are compelled each year to express regret, in terms now stereotyped, that they are still unable to give the members any hope of obtaining a more suitable abode. Let us see what amount of moral support is afforded to the Institution through the number of visitors attending, whose admission is gratuitous. Taking the number of days during the year when the building is open to the public at three hundred, we find that, one year with another, for 45 years the visitors have averaged 70 per diem. In 1851, when London was thronged with foreigners, the average daily attendance was over 170. In 1865 it averaged 60 per diem; and there was actually a falling off in the succeeding year, when the world was stirred by the revelations of the Austro-Prussian war. In 1870 the public was moved for a little while to take an interest in things naval and military, and came to visit the Institution in somewhat greater force. The interest, however, quickly subsided; and in 1876 there were fewer visitors to Whitehall Yard than in any year since 1857, when the average daily attendance was only 42. As regards any pecuniary support given by outsiders, we find that, from the foundation of the Institution to this day, only very small donations of actual money have ever been contributed, with the exception of a legacy of 100*l.* in 1875. Yet various members of successive Governments have not been slow in acknowledging the great merits of the Institution. "It does not require," said Lord Pembroke, speaking for the War Secretary, in 1875, "a very deep insight into its workings, or very great experience, to see the very great advantages which it possesses, and the enormous capabilities it has both for acquiring and diffusing information." And as far back as 1860 Lord de Grey and Ripon, then a member of the Government, said, addressing the members, "I assure you I entertain the very highest appreciation of the value of the services rendered by this Institution, especially of late years to the united services of the army and navy." Sir John Pakington, First Lord of the Admiralty in 1867, was a degree more practical in his appreciation of the services rendered by it. "If," he said, "the objects of this Institution cannot be satisfactorily carried out without an increase of assistance from the public funds, I am quite willing to express my opinion that that assistance ought to be given." In his address at the Institution in 1870 Mr. Secretary Cardwell was indefinitely alarming and vaguely reassuring. "I sincerely hope that if, in consequence of any improvements that may take place in your neighbourhood, you are disturbed, the result may be that I may have the pleasure of seeing you in a more commodious place." Nevertheless, while successive Ministries have for many years past found themselves unable to refuse their acknowledgments of the good done by the Institution, no steps whatever have been taken to come to its assistance. Money is forthcoming in plenty to tinker up some old, scarcely seaworthy craft of obsolete armament and construction; we can spend millions upon barracks all over the country, and then inquire what use is to be found for them; we can vote 10,000*l.* for providing the Lieutenant-General commanding our show-camp at Aldershot with an imposing house; but this wealthy Empire cannot seemingly afford to roof respectably the members (now numbering not far from five thousand, and among them two or three hundred generals and admirals) of an Institution which stands *facile princeps* among its kind. The Council, we believe, really ask for very little. They would probably be quite willing to accept on behalf of the members a definitive grant of the present site, with some additional ground towards the river, when the building might be rebuilt by degrees and considerably enlarged; and, on the whole, this might be preferable to removal to a grander house which would necessitate temporary stoppage of the work of the Institution and the breaking up of the Museum.

The house in Whitehall Yard contains a library, a museum, and a lecture-hall. The library has some nineteen thousand volumes or more, comprising, as the Duke of Cambridge testifies, the best works on the professional questions affecting the two services. "There is here," he says, "a place of reference for those officers who are fond of their profession and who look scientifically at it, which they could not find anywhere else." Every year the most noteworthy publications in different languages are added to the collection; and an exchange of journals is made with foreign Governments and with various scientific Societies in this and other countries. The accumulation of books—many of them rare and valuable—has become so great as to overflow the available space, and tax to the utmost the efforts of the excellent secretary and librarian. In the Topographical department will be found a wide collection of maps, plans, charts, sketches, lithographs, sailing directions, &c. The museum is as overcrowded as the library, and many things are refused admission for want of space. Here is to be seen every kind of weapon, offensive or defensive, with which every kind of people, savage or civilized, in mediæval or modern times, has provided itself for war purposes. There is everything here from the poisoned arrow of the cannibal of the Pacific to the latest novelty in breechloading rifles; from a coat of mail made of the fibre of the aloe to bullet-proof infantry shields, with models of armoured turrets or broadsides of iron-clads. Those for whom Waterloo is not a forgotten story may see the famed field spread out before them—every hamlet and house and hillock, and the armies in the thick of the fight, all represented in relief and with the utmost accuracy. The siege of Sebastopol is exhibited on the same principle; and the model rooms contain also several valuable miniature representations of celebrated fortresses. Beyond this the museum has a comprehensive collection of shipping of every form of construction, from a trireme and a catamaran to wooden three-deckers and ironclads. The battle of Trafalgar is exhibited on much the same principle as the battle-fields on land. Surely all these things—not to speak of their value to the historian—offer strong attractions to those who take an interest in their country's pride of place and deeds of honour and duty; in Paris or Berlin or Vienna such an exhibition would be thronged with visitors. In the lecture hall some eighteen or twenty lectures are given annually by naval and military officers, and by eminent civil engineers, on the questions of the day—politics and theology being excluded from the debate—and a discussion usually follows. The lectures and subsequent observations are printed and published at a very moderate cost in the Journals of the Institution. The value of the varied and interesting contents of these Journals may be inferred from the fact of their being translated into other languages by foreign Governments, who thus obtain the opinions of our best men upon problems connected with naval construction and armament, systems of gunnery, merits of novel weapons, torpedoes, &c., tactical changes, and scientific questions bearing on the production and utilization of the metals for war purposes, and on colonial, Indian, and Asiatic questions generally. Those who wish for evidence of the absorbing interest shown abroad in all naval and military problems should consult in the Journals the "Occasional Papers" edited with conspicuous ability and diligence by Colonel Lonsdale Hale, R.E. These most valuable Journals command at home but a limited, though we are happy to add a slightly increasing, sale. A gold medal is given each year to the writer of the best essay on a special subject chosen by the Council of the Institution, which subject is alternately a naval and a military one. All members, whether belonging to the army, navy, militia, yeomanry, marines, Naval Reserve, or Volunteers, and all persons eligible to become members, are allowed to compete for the prize. The successful essays, and sometimes those which obtain "honourable mention," and which are frequently of no common merit, are published in the Journals of the Institution. A payment of 10*l.* gives a subscriber the rights of membership for life, including the free postage and gratuitous issue to him of each copy of the Journal, which is published two or three times a year. Annual subscribers pay 10*s.*, or, to secure the gratuitous issue to them of the Journals, 1*l.*; and, when serving abroad, subscribers of 10*s.* per annum may have the Journals gratuitously. As the Duke of Cambridge has said, "The subscription cannot affect the pocket of any man, and need be no obstacle in the way of any officer joining the Institution."

Enough has been said to show that the United Service Institution is strongly deserving of public support; but it can hardly be expected that the public at large will appreciate its value if the Government, while lavish enough of encomiums, nevertheless withholds the very moderate means necessary to enable the Institution to assume its right place. In one respect there has been a considerable change for the better during the last thirty years. In 1851 the distinguished General Sir Lintorn Simmons, then holding of course a more subordinate position, was, to use his own expression, "severely wigged" by the authorities for presuming to express within the walls of the Institution advanced opinions upon the purely scientific question of a system of fortification. "The authorities did not wish the question discussed, because it interfered with their own prejudices"; and, added Sir Lintorn, "I was reminded that there was a station in the West Indies which I might have to visit for the sake of my health." That state of things, it is satisfactory to know, has passed away. Other antiquated notions will no doubt follow. It will by and by come to be believed that in a free country no danger is likely to arise from giving a frank and generous recognition to the claims which the services have upon the nation. Our tardiness in perfecting the military machine is in some measure due to the unacknowledged but old-standing instinctive jealousy of giving the military element too much importance in the country; and it finds another potent excuse in the argument that, as the commercial interests of peoples extend, the general unwillingness to imperil these by war will outweigh motives of greed and ambition, and that consequently the necessity of maintaining great and costly armaments will gradually diminish. The state of the world surveyed "from China to Peru" offers a curious commentary upon, at any rate, the present value of this comfortable doctrine.

AMATEUR DEALERS AND CHAPMEN.

THERE are few instincts more innate in man than that of endeavouring to get the best of a bargain with his fellow-creatures. However anxious we may be for the greatest good of the greatest number, and whatever may be our solicitude for the regeneration of the human race, the fact remains that we like to sell our friend a horse. It is rather the exception than the rule when a taste for dealing is not developed in early youth. We are scarcely out of our cradles before we begin to drive a brisk trade in the ware known in domestic circles as "being good," for which we receive payment in toys, sweetmeats, and juvenile entertainments; and when we go to school we do sharp strokes of business

by persuading hungry boys, in the heat of the moment, to exchange pocket knives for jam pies, or by dealing surreptitiously in contraband goods, such as fireworks, at a considerable increase on their strict commercial value.

It is proverbial that, when a lawyer makes his own will, he generally produces the most unlawyerlike of documents; in the same manner, when a gentleman assumes the *rôle* of a dealer, he often makes the most ungentlemanlike of bargains. As a rule, it may pretty safely be laid down that to buy from a tradesman is by far the best, the fairest, and the cheapest mode of proceeding; that to buy from an independent commoner is bad; to buy from a peer much worse, and to buy from a parson by far the worst of all. Further, it is a curious anomaly that it is usually safer to deal with a stranger, or even an enemy, than with a friend. How often one might say to the latter, in the touching words of the ghost in the poem, "Behold me; you told me you'd be true—and you sold me!" It is frequently found that among men who pride themselves on their honour, and even on their religious principles, it is thought justifiable, in what they term "matters of business," to carry astuteness to a point from which professional men of ordinary honesty would shrink. When a disputed matter is "placed in the hands of a lawyer," it is, in the majority of cases, the client and not the solicitor who is anxious to take advantage of every available legal quibble. Many lawyers will bear us out in saying that one of their most unpleasant professional duties is that of trying to persuade their clients to apply the ordinary rules of justice, integrity, and honour to business matters, instead of catching at every technical subterfuge which may present itself. But opportunities of getting the better of our friends in lawsuits are comparatively rare, and for this reason amateurs have recourse to the everyday pleasure of selling a thing for more than it is worth. The most respectable of country gentlemen, for instance, like to do a little business in shorthorns. You go to a quiet, stay-at-home, wealthy chairman of quarter sessions in search of one of these beasts, and you feel that your own father could scarcely look more trustworthy. There is something about the breadth of the brim of his hat and the pattern and cut of his neckcloth which inspires you with confidence, while the rustiness of the coat of one so rich shows that he is not likely to keep stock of fanciful value. Your stroll with him through his rich pastures is very agreeable, and he gives you friendly advice with regard to your future herd, which, as a young breeder, you feel will be of infinite value. You are in very great luck, for he is happily able to allow you to have a little calf of his best blood, which had been bespoken a year before its birth by a duke, whom death has unfortunately prevented from having the happiness of becoming its possessor. That a hundred guineas is the trifling acknowledgment you are to pay for a little beast that would only be worth a sovereign to a butcher is too small a matter to be worthy of consideration, and bargaining would be out of the question with the great man from whom you are purchasing. The dog-dealing clergyman is another type of the amateur jobber. He often breeds some rather uncommon kind of dog, possibly a species of wolf-hound, the progenitors of which he purchased during his travels in the East, perhaps at an Armenian convent. He invites inspection of these interesting animals, and the intending purchaser makes a pilgrimage to the hermitage of the clerical breeder. This he finds to be an unusually snug country rectory, looking the perfection of all that can possibly be expected in a well-ordered parsonage. Pictures of the Holy Land hang on the walls of the drawing-room, and an oak *prie-dieu*, in a little recess lighted by a stained-glass window, betokens the devotional habits of the family. The divine himself presently appears, dressed in strictly clerical, but sensible garments, well suited for hard work in a country parish. He will be delighted to show his pets to his guest, but first he would like to take him into the church. In the dim religious light of that lately restored building it seems profane to think of dog-dealing, but the clergyman observes with a pleasant smile that the handsome rood screen, which is not yet completed, has been paid for chiefly by money obtained by selling his dogs. A few minutes later, when the ecclesiastic stands on his lawn, in his rough serge cassock, staff in hand, while three large wolf-hounds bay around him, he looks quite like an Eastern monk or a Greek patriarch. No money (so he says) would purchase either of the magnificent beasts which are playing round their reverend master, but the visitor's name is entered in a book in which it is arranged that the first time one of the big hounds has puppies he is to buy one of the little things as soon as it is weaned for ten guineas, and, after giving a pound towards the host's collection for a new lectern, he departs.

It is in horse-dealing, however, that the amateur most excels. Indeed in this matter he often surpasses professionals. There are some gentlemen who, by a curious and unbroken succession of coincidences, always happen to have "exactly the horse to suit you." He is *such* a nice horse; his breeding is perfection, he has carried a lady, a child might ride him, and, like the model servant, he is not to be parted with on account of any fault. Not unfrequently his owner had never thought of selling him, but will let his friend have him out of pure good-nature. Those who have become the happy purchasers of this typical beast can best attest to its merits or demerits. There are "Lairds of high degree" who buy many horses with the sole object of selling them at a profit. They cultivate the acquaintance of hunting men, and when they know that any of them want to buy horses, they invite them to their houses. Their own studs are, they say, too large, or they have young horses coming on, and want to sell off the old ones to make room for them. Sometimes they openly avow that they will sell any horses they have. The intending purchaser is probably overcome with the hospitality of his host, who is the most gentlemanlike of men, and it is likely enough that the social position of the seller is considerably higher than that of the buyer, for amateur horse-dealers are not invariably commoners. It is something, thinks the purchaser, to stay at a fine house in one of the best hunting counties in England, and to live for even a couple of days with lords, ladies, and baronets. An instructive walk is taken through the stables before dinner. This horse, points out the master, would not suit the guest, as he is not quick enough; that horse is very good, but he dwells the least in the world at his fences; another horse pulls. "That brown horse," candidly observes the amateur dealer, "is lame." What an honest man is mine host, thinks the guest. At last a certain loose-box is reached. "Now there is a horse," begins the owner; and then follows a long and confidential conversation, in which the merits of the animal in question are detailed, and it is arranged that the guest is to ride him out hunting on the following day. A particularly nice man happens to be staying with the proprietor of the establishment, who appears to know a good deal about the horses. He tells an amusing story of a famous run in which the host had kindly mounted him on the horse in question, when, thanks to the extraordinary jumping powers of that animal, he had succeeded, without the slightest difficulty, in pounding the whole field and getting the run entirely to himself. The next morning the possible buyer is put upon a charming hack to be conveyed to cover, and his host urges him not to change horses until the hounds find. At the first whimper of a hound the hunter which he is intended to purchase is brought up, and he mounts it for the first time. His host suggests that, if he wishes for a good start, he cannot do better than follow the particularly nice man, who knows the country well. When the hounds go away, he follows this clever pilot, who leads him over some big fences into the most prominent position of the field. He feels that he is on a remarkably fine fencer, and when the gallop is over he is delighted to find that he and his pilot have had the run pretty much to themselves. Being greatly pleased with his mount, he would like to ride him for the rest of the day; but his kind host is most anxious that he should try two other horses which he has brought out for him, and he insists on the necessity of a change of horse in order to avoid fatigue. Neither of his other mounts at all comes up to the first; and, as he canters home on a delightfully fresh hack, he eagerly agrees to buy hunter number one, at the kind of price which one expects to have to pay for an exceptionally good horse. He never in his after experiences has cause to alter his opinion as to the animal's being an extraordinarily fine fencer; but it may have been observed that his judicious host took care that he should not ride the horse along the road; and when, in the character of happy owner of the quadruped, he proceeds to ride him to cover, he discovers that the beast is the very worst hack he ever sat upon. Then the particularly nice man had invariably led him over large flying fences, which the horse had negotiated with ridiculous ease; but when his new owner rides him slowly over blind ditches or cramped places the brute stumbles and flounders about in a manner which is absolutely appalling. After a fair day's hunting the horse is so exhausted that he is unfit to come out again for three weeks. He cannot always have such an easy day as that on which his new master first rode him, when he was sent home at twelve o'clock after a twenty minutes' burst. It may be objected that the brute we have described had unusual peculiarities, but we reply that, whatever may be the peculiarities and infirmities with which his horses are afflicted, the clever amateur dealer will contrive by some means or other to conceal them.

Another common type of amateur dealer is the younger son who becomes an agent to a large estate. He is always ready to sell his hunters, his ponies, his dogs, or his cattle. He has Berkshire pigs with perfect points, Highland cattle of the most picturesque colours, and hunters that are warranted never to make mistakes. If perfection is to be found anywhere in this wicked world, it is in the yards of the gentleman agent. He is always convinced that he happens to have just at present that much-to-be-desired object—exactly the thing you want. Altogether, it is some comfort to reflect that in these days of *parvenus*, party-giving shopkeepers, and millionaires of mushroom growth, there are still left many well-bred gentlemen who are always ready to make a few pounds out of us, the moment that an opportunity presents itself.

CHEPSTOW CASTLE.

WALES is now as quiet as a country churchyard; but if severity of past oppression could help to explain the survival of a spirit for Home Rule among the Welsh, as with their brother Celts, it might suffice, in evidence of bygone military tyranny, to point to the traces of the Lords Marchers, some of whom were the same men who carried fire and sword among the Irish. Though the Conqueror penetrated Wales, he left its people unsubdued, the "natural bravery" of the country, with its rivers, rocks, and mountains, being a foe that required something more than a sudden inroad to overmaster. Our Afghan experience has familiarized us with the difficulties of warfare in a country defended by cliffs and passes as rugged as the people whom they shield; and the military system of William I. was one which he might well have adopted to extend an Indian frontier, had

his career of conquest carried him to the East. He empowered his great barons to castellate each strong natural position on the Welsh borderland, both for defence of the English territory and to form bases for aggressive operations against the Welsh people. Paying no respect to Offa's Dyke, which, like the walls of Romulus, it had once been death to overpass, the Lords Marchers, as these independent chiefs were called, pushed forward their unscientific frontier into the heart of Wales. In advance of the main line of important strongholds which they erected, of which Gloucester, Shrewsbury, and Chester were representatives, stood the castles of Strigul or Chepstow, Monmouth, Hereford, Chirk, Hawarden, Flint, and others—all erected, says Mr. G. T. Clark, within half a century of the Conquest; while numerous other fortresses on the Welsh coast for 130 miles between Chepstow and Haverford, on the northern side of the Bristol Channel, secured the admission of supplies and protected the passage of ships from the western ports of England to Ireland.

Chepstow Castle in its earlier features is identical with the *Castellum de Estrihoel* of Domesday; the latter name, according to a Saxon poet of the twelfth century, quoted by Leland, being a corruption of *Strata Julia*, which Roman route crossed the Wye near Chepstow. The original stronghold was founded by William FitzOsbern, the famous seneschal of the Conqueror, to whose recommendation of vengeance against Harold's perfidy, backed by the promise of sixty ships filled with fighting men, we owe, according to Wace, the battle of Senlac with its consequences. The castle stands on the irregularly sloping edge of a lofty limestone cliff that rises perpendicularly from the Wye, by which river it is defended on the north, the other sides being secured by a deep dry moat. We hear nothing more of FitzOsbern's connexion with the castle, except that after he was slain (in 1070) on a military expedition to Flanders, his son Roger became possessed of this part of his estate, though he lost it eight years after in rebellion against the King. The powerful De Clares then received from the Crown the lordship of Strigul. These took their name from Clare, in Suffolk, which was one of the hundred and sixty manors granted to Richard of Brionne by his cousin german the Conqueror, as his portion of the English spoil. Walter, the third son of Richard, by way of increasing his patrimony, received royal license to the overrule of what lands he could conquer from the Welsh, and the whole of Nether-Gwent, or Monmouthshire, became the reward of his enterprise. How far the holy and beautiful house of Tintern, which he founded in 1131, was intended as an atonement for the crimes incident to aggressive warfare is unknown; but we may be sure, from the manners of his ungentle times, that he needed more mercy from heaven than he showed on earth. In 1139 the funeral torches were flaring in the hands of the white-vested Cistercians over his remains, which were interred in the monastery he had lately built. As he left no offspring, Walter de Clare's estates passed to his nephew, Gilbert FitzGilbert, surnamed Strongbow, who in 1138 was created Earl of Pembroke by King Stephen, on whose side he fought. Having reduced West Wales, he died in 1148, and was also buried at Tintern.

Richard Strongbow, his son, gained military renown in Ireland rather than in Wales, and added a fresh chapter to the annals of human ferocity by the unrelenting fury with which, during five years, he warred against the people. His death, in 1176, was attributed by the Irish to divine vengeance, their opinion being confirmed by the remorse of his last moments, when he confessed that he had been smitten by the saints of Ireland. Isabel, his heiress, married William Marshall, whose name, though not found in the index to Mr. Green's *Short History*, may be discovered to have been of some eminence in his time by no more recondite a reference than to Shakspeare's *King John*, where he wins the blessing of the reader for his humane interference to save Prince Arthur from being barbarously blinded. Marshall was, indeed, so important a personage that the protectorship of the kingdom had been mainly vested in him during the absence of Richard I. on the Crusades. But humanity was hardly a virtue of his character, his cruelties in Ireland having been quite in keeping with what might be expected from a successor to Strongbow. In addition to these excesses he seized among the spoils of war two fair manors of the Bishop of Ferns, for which sacrilegious act he was excommunicated by the injured prelate. The Earl died (A.D. 1219) unabsolved, and went to his place. Unwilling to leave the brave knight in torment, or perhaps thinking it more profitable to get back the fat manors in exchange for his soul, the Bishop went to the English Court, and persuaded the King, Henry III., to accompany him to the Temple Church, where the Earl was buried, and where his mailed image may yet be seen. Standing before the tomb he exclaimed, "O William, who liest here, an alien from salvation, if those lands which thou didst perniciously take from my Church be plenarily restored, either by the King who here listens or by any of thy friends, I then absolve thee; otherwise, I ratify thy sentence of eternal condemnation." Henry thereupon privately advised the Earl's eldest son to give back the manors for the sake of his father's soul; but the son replied, "I do not believe that my father got them unjustly, therefore the curse of the old doting bishop will fall upon himself—for my part I will not lessen my rightful inheritance." The prelate, with increased indignation, went again to the King, and said, "Sir, what I have spoken cannot be reversed, the sentence must stand; the punishment of evildoers is from God, and therefore the curse which the Psalmist hath written shall descend upon the Earl. His name shall be blotted out in one generation." As it happened, Earl Marshall's five sons died childless, his five daughters consequently becoming his heiresses. By marrying Maud, the eldest of these ladies, Hugh Bigod, Earl of Norfolk, became lord of Strigul. The last of the Norfolk family who held this demesne was Roger, the nephew of Roger the son and heir of Maud. He rebuilt (in 1269) the monastery of Tintern, with what grace and majesty may be seen by the present ruins. Having no offspring, his lordships went to the Crown, to which they belonged when Edward I., a week before Christmas in 1284, visited Strigul Castle. All the estates of the Bigods, including the tower and town of Strigul, were given by Edward II. (in 1312) to his brother Thomas Brotherton, who about ten years later granted them to Hugh de Spencer, Lord of Glamorgan. In October 1326 the castle was victualled against the Queen and Mortimer; and, while held by De Spencer, its walls afforded a few days' refuge to Edward II., who was now being hunted to destruction by treason and domestic malice. By his Itinerary (like that of Edward I. published by Mr. Hartshorne in the *Collectanea Archæologica*) it may be discovered that he was at Strigul from the 15th to the 21st of October of the year before his tragic death in 1327. While there, he fatuously appointed Hugh de Spencer, a man as weak as himself, to be commander-in-chief of the muster of horse and foot against his foes. On De Spencer's execution the fortress reverted to Brotherton, with whose descendants it continued until the time of John Mowbray, who succeeded to the estates in 1432. Mowbray sold the castle to Sir William Herbert of Raglan, created Earl of Pembroke in 1468, and "the first man," says Fenton in his *History of Pembrokeshire*, "by name, birth, and descent a Briton, who since the Norman Conquest was advanced to a title of honour." The earldom was given partly in reward for his putting to flight Jasper Tudor and his companion rebels. Shortly afterwards (1469) he was despatched at the head of 18,000 Welshmen, assisted by Stafford Earl of Devon with 6,000 archers, to quell the outbreak in the North made on behalf of the Lancastrians by Sir John Conyers and Robin of Riddisdale. The adverse armies met at a plain near Edgecot in Oxfordshire. Both leaders of the King's party were lodged at Banbury the night before the battle, and "there," says Hall, "the Earl of Pembroke putte the Lorde Stafford out of an inne, wherein he delighted muche to be for the love of a damosell that dwelled in the house." This damosell was the occasion of many unblessed words and "crakes" between the Earls, and finally of the desertion of Stafford with his archers. Thus abandoned, although Earl Pembroke and his stalwart brother, Sir Richard Herbert, did great feats of valour, the day was lost to the Welshmen, and with it 5,000 men. Chiefly at the instigation of "John Clapham, Esq., servant to the Earl of Warwick," Pembroke, with his brother, was condemned to die, a fact commemorated in Wordsworth's description of Bolton Abbey in the "White Doe of Rylstone":—

> Look down and see a grisly sight:
> A vault where the bodies are buried upright,
> There face by face and hand by hand
> The Claphams and Mauleverers stand;
> And in his place among son and sire
> Is John de Clapham that fierce esquire,
> A valiant man and a name of dread,
> In the ruthless wars of the White and Red!
> Who dragged Earl Pembroke from Banbury Church,
> And smote off his head on the stones of the porch.

The estates and honours passed to Pembroke's son William, afterwards Earl of Huntingdon, and were conveyed by his daughter and heiress to her husband, Sir Charles Somerset, of whom the Duke of Beaufort, the present owner, is the descendant.

Two years after the tragedy of Banbury, Jasper Tudor, in company with the young Earl of Richmond, the future King, marched from Chepstow (a name which first occurs, says Mr. Wakeman, in 1307) with the intent to relieve Queen Margaret; but on his way news met him of the disastrous fight of Tewkesbury, which induced him to retire to the stronghold he had just quitted. "While he here tarried, one Roger Vaughan, a very valiant man, sent thither by King Edward for that purpose, went about by a trayen to take him, whereof the Earl being advertised took the said Roger within the town and cut off his head; and so he suffered death at the Earl's appointment, which himself essayed by guile to have brought the Earl unto." Evidence of a more tranquil state of things is afforded by the visit of Henry VII.'s Queen to the Castle, who appears to have been making a tour in Monmouthshire in the harvest-time of 1492. A payment of 10s. for a goshawk, and another 10s. "to the mariners that conveyed the Queen's Grace over Severn beside Chepstow," on her way to Berkeley, make up the recorded incidents of her stay. The history of the fortress during the next hundred and fifty years is of no eventful character, but in 1645 it was garrisoned for Charles I. In October of that year Colonel Morgan appeared before Chepstow with 700 horse and foot; the castle afforded little hindrance to the taking of the walled town, and the example of the townsmen was followed after a siege of four days by the capitulation of the citadel. There was, however, living in Glamorganshire a stalwart baronet, Sir Nicholas Kemys, who was accounted the Samson of his day. As an instance of his strength, it is related that he was one day met in his park by a noted Cornish wrestler, who, desiring to win fresh laurels, asked the baronet to try a fall with him. The request was answered by the Cornishman finding himself first thrown on his back and then over the park wall, his conqueror politely sending his ass in like manner after him. A place is still shown in the park wall at Cefn Mably as the scene

of the exploit. A more significant feat was the capture of Chepstow Castle, which in May 1648 was betrayed during the absence of the Governor into the hands of Sir Nicholas, who got possession of a fort by night. Cromwell, chagrined at the event, and being in the neighbourhood of Chepstow, marched upon the fortress, but found the defence too obstinate to be speedily overcome. He therefore left Colonel Ewer to pursue the enterprise, who beleaguered the walls until the garrison was reduced by famine. On surrender Sir Nicholas Kemys was slain in cold blood, together with 48 men, 120 prisoners being taken. These were temporarily confined in the adjacent Norman Priory church. Before the days of the Commonwealth were ended, the castle received (in 1656) as a captive the illustrious author of *Holy Living and Dying*. Though no insurgent, Jeremy Taylor was too distinguished a Royalist to escape the notice of the Government, but he was not ill-treated, and his imprisonment endured only a few months.

The noble architectural remains, though the towers and halls are roofless and floorless, are sufficiently entire to recall to view the walls that confined the Chrysostom of English divinity. Of the former strength of the fortress there is yet visible evidence. The outer walls retain enough completeness to prevent entrance except by the massive eastern gateway. This is of the period of Edward I., and, entering between its bold round towers, we find a grass-covered court, sixty yards long by twenty broad, which is succeeded by three other courts of narrower proportions, the whole fortress having been constructed in adaptation to the natural ridge on which it stands. Though there is some Roman masonry in the structure of the great west gate, we need give no more credence to Stowe's assertion that the castle was first built by Julius Cæsar than to Leland's report that a tower called Longine was "erected by one Longinus, a Jew, father of the soldier whose spear pierced the side of Christ." To the right of the eastern or principal gatehouse are the offices, including the kitchen and lesser hall (temp. Edward II.), some of which apartments are inhabited by the custodian of the ruins. To the left is an ivy-draped building, outwardly perfect, called Marten's Tower. This is an Early English work, and contains in its upper story the lord's oratory—a beautiful thirteenth-century chamber, with a fine window, enriched with rose ornament. That so pronounced a sceptic as Henry Marten the regicide should have had this fair chapel among the rooms he occupied when his capital sentence was commuted to a mild kind of imprisonment for life, is certainly not an instance of the fitness of things. His twenty years' confinement in the castle became, as political hostility relented, so relaxed that he was allowed to have his family in constant residence with him, and even to visit people in the neighbourhood. Beyond the second court, which has been planted as a garden, stands FitzOsbern's Norman keep, or what remains of it, a good deal of Early English work, including some fine details in the clustered columns of the windows of the great banqueting hall, having replaced the earlier structure. Here was the scene of the fierce revellings of the De Clares and Bigods when their deeds of warfare were projected or rehearsed. The story of one of their raids is told in Scott's rattling ballad "The Norman Horseshoe," which has given so much satisfaction to Mr. George Borrow that his *Wild Wales* commemorates hardly anything else in connexion with Chepstow Castle. Beyond the great hall is another courtyard, and finally the back gatehouse.

A NEW EXPERIMENT IN TURKISH FINANCE.

THE *Statist* of Saturday last contains a very full account of an experiment which is being tried in Turkey, and which is of interest to all who desire to see the reform of the Ottoman Empire. Some of the information supplied had appeared previously in the Constantinople correspondence of the *Times*; but the *Statist* article enters into details on matters of the highest importance that were not touched upon in the earlier notice, and treats the subject from the point of view of the statesman as well as of the financier. We may briefly give the substance of our contemporary's account. In the month of November last the Porte entered into a convention with a Syndicate of bankers, of which the Imperial Ottoman Bank—the State Bank of Turkey—is the chief, by which it agreed to hand over to the Syndicate the administration of the so-called indirect taxes—those on tobacco, salt, stamps, spirits, fisheries, and silk. The Syndicate was authorized to retain a million per annum in repayment of debts due to it by the Porte, but was bound to hand over any surplus which there might be above that sum, up to the limit of 2¼ millions, to such bondholders as should comply with certain conditions. People generally did not put much faith in this convention. It was notorious that the Turkish treasury was empty. Official salaries were in arrear; even the pay of the army was months behindhand; while the Palace and its creatures were insatiable in their demands for "more, more." It was recollected how the public debt had been repudiated, and the administration of the Customs taken away from the Ottoman Bank; and it was predicted, naturally enough, that the Convention would never come to anything. Even if, contrary to all probability, the Porte for once kept its word, the Pashas—so the prophets went on to add—would defeat the whole arrangement. They would do nothing themselves, it was said, nor would they permit any one else to do anything, without a bribe; and, if once the Syndicate paid black-mail, its chance of effecting any good would be at an end. However, when the Greek New Year's Day came round, the Syndicate was installed as Administrator of the Six Indirect Taxes; and from time to time rumours got about that it was achieving an unhoped-for success. These rumours seemed to be confirmed when the Ottoman Bank, which had ceased to declare dividends, on the ground of the magnitude of the debt due to it by Turkey, once more made a division of its profits. The half-year passed away, and it became known that a Report on the working of the convention was presented to the Syndicate; but for very obvious reasons the members did not care to make the results too public, and accordingly they kept back the Report from the press. But curiosity was aroused, and on Saturday last our enterprising contemporary published what the French call a study of the document. It is this which we now propose to examine.

The first and most important task of the Syndicate was to appoint a Chief, or Director-General, of the administration. Upon the choice which they might make manifestly depended the success of the experiment. They selected Mr. Hamilton Lang, a gentleman who, we believe, was formerly in the Consular service, but who had passed over to that of the Ottoman Bank, and had made the Tobacco *Régie* of Roumania so profitable that the Government of the Principality bought back the concession which they had made of it. Mr. Lang quickly justified the good opinion formed of him by his employers. He had to organize an administrative service separate from, and independent of, that of the Sultan, yet in the last resort obliged to lean upon the Sultan's authority for protection; and he had to do this for the purpose of taking away a considerable revenue from a greedy and bankrupt Government. It is evident that the greatest tact and judgment were requisite to avoid hurting susceptibilities and arousing suspicions. For these reasons, and no doubt also with a view to economy, Mr. Lang determined to form his staff as largely as possible of natives, and to employ Western Europeans only where they were absolutely indispensable. Out of a service of 5,714 persons, we find that all but 130 are Mohammedans, and even of the 130 it would seem that a considerable proportion are Greeks, Jews, and Armenians, though on that point no definite information is given. The higher ranks of the service comprise 24 Controllers, 11 Inspectors, and 8 Sub-Inspectors—in all 43 persons; not a very large number for so numerous a staff spread over so extensive an Empire, between the differents parts of which, for want of roads and railways, communication is difficult and slow. The whole cost of this service of nearly six thousand persons is barely 200,000*l.* sterling, which, if equally divided, would give barely 35*l.* a year each. But, as the Controllers get about 270*l.* per annum each, and the Inspectors and Sub-Inspectors likewise have comparatively high salaries, the pay of the great majority of the body is very much less than 35*l.* per annum. The salaries, however, are regularly paid, and this goes far to ensure faithful service. The writer in the *Statist* very justly regards the fact that the service is zealous and devoted as the most important and instructive result established by this experiment. The hope of reforming and regenerating Turkey would be faint indeed if the materials of an honest and efficient Civil Service could not be found in the native population. If it were discovered that the corruption of the Pashas had descended to the classes below them, the task would be not merely to reform a Government, but to regenerate a people. Mr. Lang, however, bears testimony in the very strongest language to the zeal, devotion, and efficiency of his subordinates, and we may consequently regard it as proved that nothing but Western European control is needed to ensure to Turkey a good administration.

Passing to the pecuniary results of the experiment, we must premise that the task of organizing the service necessarily took up a good deal of time, and that the difficulties of the task were aggravated by the absence of all records of the preceding administration. When Mr. Lang, on entering upon his duties, wished to draw up an estimate of income and expenditure, he found that there existed no documents on which to base his calculations. Besides this, as soon as it became known that the convention was signed, there was a rush on the part of traders to lay in stocks of tobacco, salt, and so on, it being well understood that under the new *régime* evasion of the duties could not be compassed by bribery. For a long time, therefore, there was little demand for these articles. Lastly, the provincial authorities, as had been anticipated, withheld their support from the officers of the Syndicate. Mr. Lang acknowledges that the Porte honourably carried out its part of the compact, and issued strict injunctions to the provincial authorities to give their assistance to the Syndicate. But smuggling is rife all over Turkey, and everywhere the local authorities are in league with the smugglers. They lent no help, therefore, in putting down smuggling. In one place, when informed that tobacco was being smuggled on a large scale, the authorities refused to move, on the plea that the information should have been in writing, and that the police were not strong enough. In another place they refused to punish smugglers who had maltreated the Syndicate's servants. It will thus be seen that there are good reasons why the yield of the first half-year should be very exceptionally below the normal yield of the taxes in question. Yet Mr. Lang estimates a net revenue of about 418,500*l.*—we say "estimates," because, owing to the difficulties of communication, it takes about three months to get in the verified returns from distant places like Bagdad. When the system is in complete working order Mr. Lang estimates that the net revenue will reach about 1,620,000*l.*

sterling per annum, which would leave over 600,000*l.* for the bondholders. And we may add that it is understood that the receipts of the current half-year bear out Mr. Lang's estimates. Thus it is proved that, in spite of the loss of life and the waste and destruction of property during the war, there is even now, with all the misgovernment that prevails, a surplus income available for the payment of at least some interest on the Turkish debt.

M. OFFENBACH AND OPÉRA BOUFFE.

BY the death of M. Jacques Offenbach the world has lost a genius *sui generis*. Nothing can show this better than the miserable imitations of his art, if it may so be called, which the followers in his footsteps have produced of late. Even *Madame Favart*, which has had so long a run at the Strand Theatre, and which may be considered one of his poorest productions, is far above the best that has been written in the same style by others. Critics are apt to censure the peculiar style of operetta of which M. Offenbach was at once the inventor and the ablest exponent as being trivial, flashy, and the like; but there is always genuine fun and sly, if somewhat improper, humour to be found in his works, which degenerates into coarseness and indecency when treated by others. He possessed, in fact, certain qualities which defied imitation. A large number of people must have read with regret the news of his death from gout on Monday evening last. Born at Cologne in 1819, M. Offenbach was forty years of age before he became known to the general public. His first genuine success was the production of *Orphée aux Enfers* in 1859, and for twenty-one years he has worked with untiring energy at what we believe he found to be a very remunerative branch of musical art. He may be said to have died working, for it was only a few hours after he had superintended the rehearsal at the Variétés of his latest work, *Le Cabaret de Lilas*, that the fatal illness seized him. Having received his musical education at the Paris Conservatoire, he attracted attention as a finished player on the violoncello, and, in 1847, having become a naturalized Frenchman, he was chosen as *chef d'orchestre* at the Théâtre Français, where he remained till the year 1855. In that year he took the new Théâtre des Bouffes Parisiens with the professed intention of producing his own works, and selected a company whose talents have since achieved an almost world-wide reputation for excellence. It was not until 1859, however, as we have said, that he became known as a master of his art. The *Orphée aux Enfers* was a most decided hit, and is, we are inclined to think, at once the most original and characteristic of his works. *La Grande Duchesse de Gérolstein* is perhaps the opera which most people consider his *chef-d'œuvre*; but for genuine fun, and, at the same time, melodic power, he has not surpassed his first great success. *La Chanson de Fortunio* followed, and after some more or less successful works M. Offenbach again scored a success with *La Belle Hélène* in 1864. The ever-popular *La Grande Duchesse*, *La Périchole*, and a host of other operas—amongst which *Le Roi Carotte*, *Geneviève de Brabant*, and *Madame Favart* are the best known—followed in succession; but his later works showed every sign that his genius was on the wane. Indeed, when we reflect that M. Offenbach had reached the age of sixty-one, we cannot be surprised that his powers of creation were not as fresh as of yore.

A German by birth, M. Offenbach was nevertheless a Frenchman of Frenchmen. He had the good fortune—shall we call it?—to become the musical purveyor of fun to the mirth-loving age of the Second Empire; and, having once struck the chord, he continued harping upon it, greatly to his profit no doubt, and apparently to the satisfaction of a large and appreciative public. It is a subject for regret that he did not turn his attention to the higher branches of his art, for which not a few of his works seem, in the midst of their frivolity, to hint at undeveloped capacities. Had M. Offenbach attempted this he might have made a name which would be handed down to posterity unconnected with the almost shameless improprieties which disfigured some of his works. As they were performed in English, they were shorn of much of this, and we fear in the eyes of some of his admirers lost proportionately in interest. He fostered a style which has done much to lower the lyrical stage by choosing libretti for his music which, as has been said elsewhere, were "more than slightly improper."

The only fear is that the imitators under the shadow of M. Offenbach should get a hold upon the English public; but, if this were to happen, we should not be far wrong in prophesying that opéra bouffe would die a natural death. It is not possible that the inanities of Lecocq and Planquette can hold their own upon the stage for an eternity. Even Offenbach twenty years hence will be but a shade, and as for the others, we hope their names will hardly be remembered. M. Offenbach wrote for his time, and with his time he will be forgotten. His art was debased; and, like all inferior work, it will have its day and vanish. What, then, can we say of imitations which, so to speak, "cannot hold a candle" to the original? The best way of meeting the evil, if the evil exist, is to divert the attention of the public to comic opera of a higher tone—a deed much more feasible than at first sight might appear. If some enterprising manager would introduce such operettas as those of Adolph Adam, Dorn, or Suppè—there are hundreds of that class—or even Ambroise Thomas, Bizet, or Auber, nearly all of which are written for small orchestras, we do not hesitate to say that they would draw the public enormously. The result would be that a taste for something better than the jingle of opéra bouffe airs would become fashionable, and composers would be encouraged to write up to a higher standard than they have hitherto done. The whole question resolves itself into one of supply and demand; and, if once the public were to be made acquainted with the fact that comic operas worth listening to, or at any rate more worth listening to than opéra bouffe, were in existence, they would be eager to flock to them for the pleasure that they afford. Of course, if it were possible to accomplish that which seems an impossibility in England, a cheap opera, the battle against demoralizing opéra bouffe would be won easily. The only hold that the opéra bouffe has upon the public is, that people can go and enjoy pretty music, pretty scenery, dresses, &c., at a cheap rate; and why this should not be combined with an elevating spectacle is a question we cannot undertake to answer. The fault does not lie with public so much as with managerial taste, and that is a subject which we will not deal with here. It is easier no doubt to adapt French opéra bouffe to the English stage than to search for an original and artistic comic opera or operetta, especially if it be already known to have been successful in France. The Carl Rosa Opera Company is a good example of what can be done in the way of popularizing good operas at a price which is within the limits of an average playgoer's pocket, and it remains only for some manager to take up the lower stage of opera, and popularize it in the same way that Mr. Carl Rosa has done with the higher stage. It cannot be that England alone of all places in Europe is the only place where such a thing is impossible. The only remedy seems to lie in a cheap opera for the people. We seem to think that it is necessary to have the highest class of artists and the best orchestras in Europe to make the opera popular amongst us. It is no such thing; the opéra bouffe succeeded without it, and so can the opera proper, if only the experiment were tried. The question is when shall we find a manager bold enough to attempt the innovation which will bring back the public taste to the proper channel. The cure, we fear, can be but slow now that the poison of opéra bouffe has been allowed to have its own way for so many years. The times are, however, already looking brighter, and perhaps with the fact that real opéra bouffe has less hold upon the English public taste, and the cheapening of prices for true opera, which has lately also been a fact to some extent, we may look forward to a time when such a thing as a furore in favour of *La Grand Duchesse de Gérolstein* is nearly an impossibility on the part of an educated English audience.

Opéra bouffe is to classical opera what the burlesque is to the legitimate drama, and how far a man may be admired for devoting himself to a debased form of art is open to question. At the same time, opéra bouffe has done less harm to the opera and music generally than it has to the drama, as in all these works musical excellence is not even attempted, and only the farcical element is valued. Many theatres, therefore, where a good play was possible, have had their boards blocked by the success of these musical extravaganzas. As for music in general, there is no harm done, for there has always been and always will be a large proportion of the public who prefer pretty jingling tunes and waltz measures to the more serious and artistic works of the great composers. The real harm done by opéra bouffe has been in fostering a desire in the public for silly and extravagant pieces, sometimes in the worst possible taste. When all is said and done, it may perhaps be remarked that, after all, the mischief which has been done by opéra bouffe is by no means so great as it at one time threatened to be, and perhaps now that its great exponent is dead, it will gradually become a thing of the past in England.

By the death of M. Offenbach the opéra bouffe may be said to expire. The miserable productions of his imitators may still command audiences, but the genius which marked his works has ceased to breathe. From the ashes of defunct opéra bouffe there appears to be arising a new style of light opera of a more wholesome character, and the age of *La Grande Duchesse* is giving place to that of *Pinafore* and the *Pirates of Penzance*, whose fun is unmistakable, and though purely English, is none the less acceptable. Mr. Sullivan's success is due to the same cause as M. Offenbach's—namely, in having happily hit off the spirit of the mirth-loving public, with the addition that his work is certainly more artistic than that of his French rival. Offenbach alone, however, could produce opéra bouffe, and until another like him shows himself again, we shall have no more of it. Let us hope that we have had enough already.

AUTUMN RACING.

WITH the First October Meeting the great series of autumn races at Newmarket begins. It is then that the public form of the racing year is decided. Throughout the summer, excuses are made for this horse and the other when defeated; but when they and their conquerors meet to fight their battles over again in October on Newmarket Heath, their merits or demerits are finally settled. Then, again, many handicap horses are reserved for the Cesarewitch and the Cambridgeshire, and consequently we do not see the best of them until the autumn meetings. Indeed in most of the handicaps during the October meetings, horses are allowed to do their best, as winter is fast coming on, and there will soon be no more handicaps for which it will be worth while to get

s weighted below their merits. There are, however, a great many weight-for-age races at the Newmarket autumn meetings, and the principal two-year-old race of the year is run during the Second October Meeting. Although there is usually some excellent racing at the First October Meeting, it is by no means the most interesting of the series. It may almost be said that the great attraction of this meeting is the gambling upon the Cesarewitch and Cambridgeshire which generally accompanies it. These two great handicaps form the chief topics of conversation, and all sorts of rumours and stories are circulated about the various competitors. The running of the stable companions of the favourites is eagerly criticized, and conclusions are drawn as to the chances of many of the Cesarewitch and Cambridgeshire horses from the races which take place during the week. Much of the racing is moreover interesting on its own account. Last year, at this meeting, both Bend Or and Robert the Devil had won races; and Rayon d'Or, who had won the St. Leger a fortnight before, won the Great Foal Stakes, a race worth more on that occasion than four thousand pounds.

The First October Meeting is preceded by two important French races which take place at Paris on two successive Sundays. These are called the Omnium and the Criterium, and they are run over courses respectively a mile and a half and a mile long. This year they were each worth a little more than 830*l*. In both cases the favourites were beaten by 20 to 1 outsiders, and in each race victory was only obtained after a very hard struggle by a head. The Omnium is a handicap, and it was won by a three-year-old called San Stephano, who carried 7 st. 6 lbs. The Grand Criterium is the principal two-year-old race of the year in France. The weights are 8 st. 11 lbs. for colts, and 8 st. 9 lbs. for fillies, without penalties. These conditions, it will be observed, differ from those of our own Middle Park Plate, in which the weights are 8 st. 10 lbs. for colts, and 8 st. 7 lbs. for fillies, with certain penalties. The race was won by Perplexité, a filly which is entered for the English Oaks and the English St. Leger. The great British jockey, Archer, rode the favourite; but, although she started at the very short price of 6 to 4, she was beaten a long way from home.

After a foggy morning, the opening day of the Newmarket autumn campaign was beautifully fine, and the course itself could scarcely have been in better condition for racing. There were ten races to be gone through, and consequently the first event was fixed for one o'clock. Those who attended the first day's racing enjoyed an agreeable surprise. The winners of the Derby and the St. Leger were to meet in the Great Foal Stakes. This had not been at all expected, and it was not until near the time of the race that it was decided that Robert the Devil should run. If it had been generally known that Bend Or and Robert the Devil were to run against each other the course would have been crowded. As it was, those who were present congratulated themselves on their unanticipated good fortune in being about to witness one of the most interesting races of the year. We have already written so much about the previous battles of Bend Or and Robert the Devil that we shrink from recapitulation. It will be sufficient to say that the admirers of each of the horses were still disputing as to their merits. In the Derby, Robert the Devil had been beaten by a head, and his friends said that this was a fluke. In the St. Leger, again, Bend Or had been beaten, and this, said his admirers, was a fluke. Now they were to meet again, and it was to be hoped there would be no excuses this time. Robert the Devil was looking in the best of condition, and he showed more muscular development than on any former occasion. Indeed the horse even looked better than when he ran in the St. Leger. It was the general opinion that Bend Or did not look so well as at either Doncaster or Epsom, and sharp-eyed critics thought they detected signs of recent medical treatment on one of his hocks. At the post Robert the Devil was far the better favourite of the two; and although five other horses were to run, only one of these was at all supported in the betting ring. This was Lord Bradford's Retreat, a good-looking colt, who was receiving 12 lbs. from both Robert the Devil and Bend Or. Robert the Devil had to make his own running, which was much to his disadvantage, and the pace was wretchedly slow during the greater part of the race. Bend Or lay well back until reaching the Bushes, when he came forward and took the third place. In the Dip he made a rush to the front, and within fifty yards of the winning-post he apparently got on even terms with Robert the Devil. Short as was the time occupied by the ensuing tremendous struggle, it was a period of trying suspense to many of the spectators. The disputed question was at last, it seemed, to be decided, and there would no longer be any doubt as to whether Robert the Devil or Bend Or was the better three-year-old of the year. Bend Or was running with great gameness, and there seemed little doubt that he would repeat his Derby victory, when, just as they were reaching the winning-post, he swerved slightly, and Robert the Devil got his head in front and won the race. Now this did seem intolerably provoking. It was all very well that Robert the Devil should win, if he could; but the annoying part of it was that an opportunity should again be given of making excuses for the beaten horse of the pair. We think, however, that it will be the general opinion of the best judges of racing that Bend Or swerved because he was beaten, and that, looking at the race as a whole, there can be but little doubt that Robert the Devil beat Bend Or as fairly as it is possible for one horse to beat another. Undoubtedly the two horses are very nearly equal, and a very slight ailment, or a mishap in running, would probably prevent Robert the Devil from repeating his victory on a future occasion; but it appears to us impossible to deny that, in the Great Foal Stakes on the Tuesday of the First October Meeting, Robert the Devil gave Bend Or a fair and honest beating. We have dwelt so much upon this race, which practically settled the most disputed problem of the racing year, that we must treat the remainder of the First October Meeting somewhat briefly. In the second race of the opening day, the hitherto unlucky Abbot, instead of running second or third as usual, at last succeeded in winning a race; and when he was about it, he did it well, cantering in four lengths in front of the nearest of his opponents. There was an interesting match of the good old-fashioned Newmarket type on the same day, between Lord Clive and Favo. Although he had run very indifferently of late, Lord Clive had been considered by many good judges to be the best horse of his year as a three-year-old. Favo, on the contrary, had run very badly as a three-year-old and as a two-year-old; but this season he had shown some good form. Of the pair Lord Clive was slightly the favourite, but only at the trifling odds of 11 to 10. Favo made the running, but in the Abingdon Dip Lord Clive went up to him, and got his head in front; on the ascent, however, he tired, and Favo again obtained the lead, and won by half a length.

There was a good race on the Wednesday for the Triennial Produce Stakes. There were half a dozen starters, among which were Mask and Zealot. The latter, although he had won the Prince of Wales's Stakes at Ascot, had been an indifferent performer when pitted against horses of high class. He had been unplaced for the Two Thousand, the Derby, and the St. Leger, and had only run third to Mask in the Sussex Stakes at Goodwood. Mask had won five races out of eight this season; he had won three at Goodwood, one at Ascot, and one at Newmarket, and he had been third in the Derby. He is a remarkably good-looking horse, and we have in former articles observed that he shows an extraordinary development of muscle in his hips and quarters. Unfortunately he was prevented from running in the St. Leger, and it was doubted by many people whether he was completely sound again even at Newmarket. Elizabeth, the winner of the One Thousand, was another starter, and the field was made up by Apollo, the former conqueror of Robert the Devil, Muriel, the winner of the Nassau Stakes at Goodwood, and the handsome Retreat, who ran with the sole object of making the running for Zealot. When they came up the ascent, Mask was leading, closely followed by Zealot, and a desperate race ensued. When the post was passed, it was apparent that, whichever had won, it was a very near thing; but most of the bystanders imagined that Mask had had a slight advantage, and it is said that the jockeys themselves did not know which had won. The verdict of the judge, however, was that Zealot had won by a head. The outsider Fire King, who had hitherto run very badly this year, won the Great Eastern Railway Handicap in a canter, none of the three leading favourites being in the race.

The remarkably good-looking two-year-old filly, Thebais, by Hermit, won the Triennial Produce Stakes on the Thursday. She had previously won the valuable Ham Stakes at Goodwood. Another handsome two-year-old filly won the Second Nursery Stakes. This was Myra, by Doncaster, who had won the Rous Plate at the late Doncaster Meeting. Favo, the hero of the match with Lord Clive on the opening day, was made first favourite for the Newmarket October Handicap, but he only succeeded in running third to Elf King and Lancaster Bowman. It was nearly dark when the race was run. Lord Falmouth's celebrated two-year-old Bal Gal added to her many victories by winning the Rous Memorial Stakes on the Friday. She held her opponents safe throughout the race, and shot out and won just as she pleased at the finish.

The racing on Friday was not specially interesting; but, taken as a whole, the week was a great success. The racing was very good, and the weather was all that could have been wished.

REVIEWS.

HILLEBRAND ON MODERN GERMAN THOUGHT.*

WHATEVER may be thought of these Lectures by a public less select than the "parterre of gentlemen" before whom they were originally delivered, and to whose polite indulgence a quite needless appeal was made in one of their opening passages, they are unlikely to be regarded by any English reader as ill-timed. Not that a new book about Germany and the Germans can claim a special value as such at the present season. Of generalities of one kind or another concerning this well-worn theme we may frankly confess to have recently had enough, and more than enough. Even statistical compilations not unfrequently disappoint the respectful attention which they appear to claim as their right; and only a languid kind of interest can continue to attach even to a comparison between the annual cost of a German and that of a British soldier—a point in favour of his more frugal native land which M. Hillebrand himself is, we observe, unable to refrain from

* *Six Lectures on the History of German Thought from the Seven Years' War to Goethe's Death.* Delivered at the Royal Institution of Great Britain, May and June 1879. By Karl Hillebrand. London: Longmans & Co. 1880.

making in a note. Mere sketches of manners, on the other hand, will no doubt continue to be produced so long as Englishmen travel up the Rhine possessed of sufficient power of observation and sense of humour to be amused by national divergences in the use of the table-knife or the adjustment of the feather-bed. But it is not in such wares that M. Hillebrand deals; and, if there is no lack of ambitiousness in the title of his lectures, there is likewise much opportuneness in their theme. And this precisely because those aspects of German national progress and life with which M. Hillebrand deals happen to have rather gone out of fashion in our intellectual—or, at all events, our literary—world. While our chief English sources of periodical information concerning the non-political activity of Germany—indeed, in a lesser degree, concerning the progress of her political life itself—have grown surprisingly scanty, a feeling altogether antipathetic to contemporary German opinion and sentiment has of late years become increasingly manifest in the most self-complacent spheres of English literary criticism. It would probably have required the time occupied by one of M. Hillebrand's lectures to establish without abruptness, and to deprecate with effect, the existence of the feeling in question; and he has accordingly preferred to assume it—or at least to seem to do so—by adopting a manner half blandly apologetic, half buoyantly defiant. To the corresponding aversion which unfortunately has come not less widely to prevail in Germany, although it has happily not yet altogether estranged the German from the English world of letters, he only refers by means of a decidedly skilful *aposiopesis*. But to one of the mainsprings of anti-German feeling among ourselves he openly directs attention, though recognizing in it rather a sign of the times in general than a feature of our particular insular locality. Nor can we refuse our assent to his opinion that his own ideas as to what has been the real strength of German thought in the past, and as to what will prove its real strength in the future, contravene not a few of the principles most favoured on our chief literary and scientific *rostra*. Thus a delicate compliment to the intellectual generosity of M. Hillebrand's audience, as well as a just appreciation of fundamental differences likely to exist between him and them, is conveyed in the following sentence in his first lecture:—

> In the whole tendency of my mind, in my entire way of looking at things—religious and moral, historical and scientific—I have remained a thorough Continental, nay, a thorough German, whereas the younger generation of Europe is entering more and more every day into the intellectual current which sprang up in this island towards 1860, and has since spread over the greater part of the Continent.

At the same time, even persons unacquainted with the writings of M. Hillebrand—who has known many lands and is known in many—cannot have needed to accompany him far in these lectures in order to become assured that in him they have to deal with no German pedant, whether of the primary, secondary, or tertiary period. Even when he drapes himself with becoming severity in the philosopher's robe, he reserves to himself a freedom of movement which proves that he has not, like Freiligrath's Hamlet, "stuck too long at Wittemberg, in the lecture-rooms and among the sects." He treats even of Kant, copiously indeed, but with a comparative succinctness not commended by native examples, and shows himself capable of summarizing even that most fluid of subjects, the history of German Romanticism, as tersely as in his delightful *History of France* he has recently summarized the history of its French counterpart. M. Hillebrand, who is as much at home at Florence as he is at Paris, has of late found various opportunities of showing that among Englishmen also, as among English books, he runs little danger of losing his way. Some of his lately published remarks about ourselves to ourselves may have jarred upon our presumably still more intimate knowledge of the subject; but his generalizations, even when least flattering, could not but be allowed to have a broader basis than, say, those of M. Taine on the same theme. But he is not less candid as to both our merits and our defects when he discusses them for the benefit of German readers. Thus we were interested the other day to find him expounding in the *Deutsche Literaturblatt* (published at Gotha) the excellences and the shortcomings of so peculiarly English an undertaking as Mr. John Morley's series of unannotated critical biographies. A certain touch of dilettantism is almost inseparable from the manner of a writer so universally well-informed; and, though M. Hillebrand is something very different from a *feuilletoniste*, yet he is so overfull of special knowledge that he might, by the unwary, be occasionally mistaken for one. We hasten to add that M. Hillebrand's English leaves nothing to be desired, and cannot fairly be said even to suggest the labour which it must surely have entailed. The only oddity we have noticed is the epithet "elect," added to those of "noble," and "sympathetic" in characterizing Prince Hal, Tom Jones, and Egmont.

Even in the general conduct of his argument, M. Hillebrand, while a thorough German in the drift of his ideas and in the foundations of his conceptions, has a lucidity which is more usually found in French contemporary writers. No doubt, popular lecturers, especially when dealing with subjects comparatively difficult or presumably unfamiliar to the majority of their hearers, have good reason for aiming at this quality above all others; and, just as the discovery of the master-passion in a man used to be offered as the surest clue to the interpretation of his conduct in life, so, in order to understand the general course of a nation's intellectual progress, it may seem only necessary to ascertain and state the "mother-ideas" which determined it. M. Hillebrand has found little difficulty, without at the same time deviating from the track of most previous inquirers, in pointing out that the four

> principal ideas which Germany had to develop and illustrate in her national literature and in her scientific work were almost all thrown on the intellectual market of Europe shortly after the conclusion of the Seven Years' War. Winckelmann gave new life to antiquity by applying to it a new historical method. Lessing traced the limits between the fine arts and poetry, assigning to each of them a domain not to be overstepped. Kant, correcting Rousseau's view of the history of mankind, contended that the ideal aim of mankind was not the natural state of the savage, as Rousseau held, but a state of nature combined with intellectual, moral, æsthetic, and political development, such as was revealed in Greece. Herder, finally, starting likewise from Rousseau, believed all great creations of humanity to be the work of spontaneous action, either individual or collective and national, not the intentional result of self-conscious activity. The three first of these four great men still belong to the generation of 1760, as we should call the men born in the second and third decade of the century; the last, Herder, born in 1744, already belongs to the following generation, that of Goethe. His marvellous precocity alone permitted him to fight at the side of Lessing, his elder by fifteen years.

Whether the historical analogy be accepted or not, there can certainly be no doubt that the spring time and the summer time of modern German intellectual life are comprehended within limits little, if at all, wider than those of the period of the literary greatness of Athens. This fact would be inexplicable without its antecedents. And, though it has long been a well-known truth, it cannot in this connexion be too often repeated, that the Thirty Years' War placed Germany, as compared with the other nations capable of contributing to the progress of European culture, at a disadvantage from which it would be rash to assert that she has ever altogether recovered. On all this M. Hillebrand necessarily dwells; nor does he fail to show (without of course in the least degree laying claim to originality) what were the principal currents of national sentiment which enabled the nation, through a period of apparently hopeless decadence, to preserve its vitality. We do not quarrel with either of the twin articles of belief at the present day readily accepted by the majority of thinking Germans, that "the two springs around which the new life gathered and grew up were the Prussian State and the Protestant Religion." But, with regard to the latter, M. Hillebrand himself shows very clearly how it had, if the expression may be used, to be turned inside out before, as a national influence, it could resume the task of the national Reformation. And as to the former, we only wish that the half-conscious, half-unconscious progress of historical growths were not so often represented as the conscious fulfilment of "glorious missions." Before the great Elector's policy is extolled as consistent with that of his later successors, it is surely not too much to ask that it should be proved to have been consistent with itself.

In connexion with the central part of that period of the history of German thought which M. Hillebrand has with a pleasant but sure touch sketched in this volume, he tells us little that is new, but brings out with particular effectiveness some points which have been comparatively little noticed by English readers. Of Lessing we have recently been told so much both at first hand and at second hand, that it was unnecessary to expatiate at great length upon his share in the progress of German thought; we may, however, direct attention to a brief criticism of the *Laocoon* which is worth considering by those who are apt to overlook the incompleteness of that most striking essay. Herder, on the contrary, has received from English writers a much smaller measure of criticism; perhaps the increasing interest which is again taken in him in Germany, and which Julian Schmidt is doing his best to keep alive by means of the occasional nudges which he is in the habit of administering to the literary public, will in due time spread further. At all events M. Hillebrand has shown with considerable force that it is a shortsighted criticism which identifies Herder with the kind of cosmopolitanism with which many both before and after Napoleon have taunted the German mind. Undoubtedly he "placed humanity higher than nationality"; but, of all the leaders of German thought in the eighteenth century, it was he who most warmly defended, and by his literary labours gave most vitality to, the national principle. In a passage at the close of his fourth lecture, too long to be extracted here, M. Hillebrand certainly approaches near to proving that no other German writer of note exercised the important indirect influence upon his contemporaries and successors which was exercised by Herder. And later, in the very caustic lecture on the Romanticists—about some of whom it is indeed time that the unvarnished truth should be told—he shows very convincingly that this school of writers "might be called the real executors of Herder's bequest, were it not that Herder contented himself with emancipating the mind from rationalistic conventionalism, whereas the romanticists, after having most effectually worked in the same direction, wanted to enthral it in the fetters of a worse conventionalism, that of a dead tradition, galvanized by artificial means." Thus theirs was not a permanently fructifying influence like Herder's, the fullest operation of which upon a single creative genius is no doubt recognizable in the case of Goethe. Herder himself in his turn eagerly acknowledged the influence of Hamann, whose reputation must always remain of that rather exasperating kind which is not peculiar to German Universities. He was (to borrow a phrase of Thackeray's) too great and too good to leave anything more than fragments behind him.

We pass over what M. Hillebrand has to say about Goethe and Schiller, and more especially about Kant, the study of whom, as our readers may be aware, is at the present day being revived with

remarkable vigour in Germany as well as in this country. The observations contained in these lectures on the fundamental ideas of the Kantian philosophy were not intended, and are not likely to be regarded, as a material contribution to the study of the subject. For our own part, we are disposed to regard with distrust attempts to express in a few striking sentences the sum of Kant's moral creed as contrasted with "the German one." But, in any case, M. Hillebrand's view of this contrast is worth considering on its own account. The lecture containing it appropriately closes with a brief discussion of the question—Will Germany come back from its present condition, in which not only has individualism made room for uniformity and humanism for patriotism, but "the accidental practical life" seems to suffice for the generation which lives it? It is a question which, however it may be formulated, occupies the thoughts of more Germans and friends of Germany than are willing to confess the fact. The lecturer has the cheerful answer ready—that, "so soon as the long-yearned-for national State is complete and insured against inner and outer enemies, Germany will come back to the creed of the real founders of her civilization. But," he very judiciously adds, "she will only accept it with qualifications." M. Hillebrand, who in the best sense of the epithets is both a patriotic and a cosmopolitan writer, must excuse us if we say that it savours something of affectation when he describes his great nation as being unable just at present to allow itself "the luxury of such liberal ideas and feelings" as those which animated Lessing and Herder, and Goethe and Schiller. At what point in the consolidation of the great political work of this age will it be able to afford resuming them? And where are they to be locked away in the meantime? Among the representatives of political life themselves, or among the specialists in the Universities? Probably it depends as much upon her students as upon her statesmen whether Germany will remain true to traditions which can never be out of date or out of place like the hard-and-fast constitutionalism to which M. Hillebrand objects. Her sons may not be able to gratify the shade of Kant by elaborating schemes for a universal peace; but they need not insult the shade of Lessing by throwing stones at the Jews. We too have faith in the intellectual, as well as in the political, future of Germany; but most of all because we do not believe that the future leaders of German thought are likely to wait till Prince Bismarck can inform them that his work is done.

HANDBOOK OF INDIAN ARMS.*

THE combination of study and research brought to bear on this catalogue of Indian arms deserved to have been put before the public in a better shape. We do not look for gorgeous and expensive bindings to be paid out of a depleted Indian exchequer; but we think that the Secretary of State would not have been chargeable with extravagance had he sanctioned the expense of a binding in cloth. This work published by his order and under his sanction looks exactly like one of those flabby catalogues of improved cutlery, glass, or fire-irons which the British householder at once consigns to the rubbish-basket. We gather that Mr. Egerton, the author of the work, began to make a collection of Indian arms just a quarter of a century ago; that he gradually accumulated a quantity of notes to illustrate his collection; and that in some unexplained way he became connected with Dr. Forbes Watson, who was for a time at the head of the Indian Museum. When it was decided that the valuable collections of this latter department should be dispersed, it became desirable to utilize and publish officially the information stored up by officials and by amateurs like Mr. Egerton. The catalogue, as we have said, has been taken under the official ægis; the records of the India Office have been made available to the author; and the proof-sheets have been revised, in part or in whole, by such eminent scholars as Sir Henry Rawlinson, Colonel Yule, and Dr. Rost. When the loose and inaccurate spelling of old manuscripts has perplexed these gentlemen, it is scarcely to be expected that ordinary scholarship should not be at fault. Some of the names and phrases, as shown by Colonel Yule, are absolute nonsense, and cannot be identified with any dialect of civilized man. Where accuracy is so difficult of attainment, we do not intend to offer more than one or two conjectures. At page 125 Colonel Yule has put a query to *Unnannan*, which he describes as "reins of rope covered with velvet." We suggest to him that *inān* in Persian means reins, and that many of the elegancies and ornaments of social life were by Hindus borrowed from that elegant language. *Kirk narduban* can scarcely be pure Persian for "the forty steps or rungs of a ladder"; *Chihal narduban* would be more to the purpose, Chihal-Dokhtar and Chihal-Situn and Chihal Minar being well-known Persian phrases or places. Again, *Wadono*, a leader of division, cannot be good Sanskrit. The letter *w* is unknown to the Devanagari alphabet, though the educated youth of Bengal make strenuous efforts to introduce it in their present faulty system of alliteration in writing their own names.

We have one or two other criticisms to offer. A sketch of Indian history beginning with the poem of the Mahabharata and the rival Pandus and Kurus, and ending with the first Burmese war, was hardly needed as an introduction. To those possessing any acquaintance with this big subject the sketch conveys little or no information. Those who want enlightenment on Indian wars and sieges can best be referred to the works of Elphinstone, Mr. Talboys Wheeler, Colonel Malleson, the late Sir John Kaye, and the late Mr. J. C. Marshman. But when we come to the weapons which the combatants used, it would not be easy to find in the same reasonable compass so much information on the matchlocks, swords, daggers, spears, and javelins used by Hindus, Mahommedans, and semi-Hindu and aboriginal tribes. We do not think that many Indian administrators will endorse Mr. Egerton's doctrine that, as India is completely pacified, "the necessity for carrying weapons is disappearing or has altogether passed away." Rather does this formidable catalogue remind us that an Arms Act and a Licensing Act, and other precautionary measures against the wholesale admission of weapons and gunpowder, are just as much needed now as they were after the Mutiny. We recollect to have read somewhere an anecdote of the First Napoleon when he was shut up in St. Helena. He there gave an audience to certain Anglo-Indian officers who, in the course of their travels in the Eastern seas, had met with a tribe of men who professed to pass their lives without resorting to or forging any weapon at all. This was too much for the ex-Emperor. "Mais sans armes, comment se bât-on?" as if fighting were an immutable law of human nature, civilized or savage. The ingenuity of Indian handicraftsmen has not been less displayed in the grace and finish given to swords and fowling-pieces than it has been in textile fabrics, inlaid marble tombs, and gold and silver work. Not that we are to look for what are termed arms of perfection, or any marked improvements, or the invention of new machines for mowing down whole ranks of men at a time. On the contrary, old-fashioned matchlocks are still used in various parts of India, as they were in the Pindarri warfare; and some of the cannon fondly cherished by the smaller potentates might have been serviceable in the campaigns of Baber. They are yet to be seen in hill forts or on crumbling ramparts, if they are not hidden away in dry wells underground, under the vague expectation of some battle of Ramoth Gilead to which all Indian chieftains shall one day be summoned. But this volume supplies us with excellent specimens of guns elaborately chased, of daggers with hilts finely worked in jade and ivory, and of swords beautifully damascened in gold. We are reminded, too, that Oriental fancy plays with the appendages and accoutrements as well as with the arms of the warrior; with the saddle, the powder-flask, the leathern belt, and even the *ankus*, or hook with which the mahout guides his elephant.

And here a difficulty had to be acknowledged and met. The division of this rather vast subject caused the author some perplexity. It was a consideration whether the arms should be arranged historically, so as to show the Hindu period, the Mahommedan invasions of India, and the differences between Aryan and Turanian civilization. But on this basis there would have been great difficulty in fixing the dates of the specimens, and still greater in determining when, how, and where the rudest type of weapon was gradually improved. On the whole we think Mr. Egerton has shown sound judgment in treating the matter ethnologically, though it is scarcely possible to avoid some confusion even on this plan of research. On the whole, however, the races are kept tolerably apart, and we can recognize the gradations in destructiveness attained respectively by Mahrattas, Rajputs, Sikhs, Malays, Burmans, Gonds, and Bheels. We can picture the Mogul horseman heavily armed, with his coat of mail and plates and contrivances for the protection of his horse. There is the light-armed Mahratta, with his long spear, pistol and dagger, scimitar and shield, and thick quilted garment capable of turning a sword cut, but occasionally exchanged for chain armour of proof. The Rajput may be credited with proficiency with the dagger and the bow and arrow. A curved sabre destitute of a guard to the hilt may be said to distinguish those whom in a general way we term Afghans, but who are better described as Ghilzais, Momunds, and Shinwarries. In the use of the *kukri*, and the *kris* or creese, and the *dha* or cutlass, none are so capable as the Goorkhas, the Malays, and the Burmese. From those it is rather a descent to the wild tribes who rely on hatchets and bows and arrows such as moved Dugald Dalgetty to irrepressible laughter. The Sontals, the Gonds, the Bheels, and the tribes on our North-Western frontier can, however, do considerable execution with these primitive weapons against "ground game," and occasionally against rival tribes, though unequally matched against Regulars. The Sontal can transfix a hare or partridge as well as a deer or a leopard, using different arrows according to the size of the game; the Baiga in the Central Provinces can bring down deer with a hatchet; while the Bheel of Western India can send a barbed arrow into a fish. It is gratifying to reflect that these savages have been befriended and reclaimed by soldiers and civilians devoted to sport, and that expeditions in search of big game in wilds and fastnesses have been the means of turning sportsmen into philanthropists and of adding many creditable episodes to the pages of Indian administration.

The chapter on artillery leads Mr. Egerton to specify sundry huge and unwieldy pieces of ordnance which were cast to please the extravagant fancy of emperors and their lieutenants. One was made in 1549, in the reign of Akbar, at Ahmednuggur, and is mentioned by Grant-Duff in his history of the Mahrattas. It was so huge that the Government in 1823 were unable to ship it to England. At Asirgurh, in 1818 we captured a gun carrying an enormous weight of metal, about which fabulous reports were spread

* *An Illustrated Handbook of Indian Arms; being a Classified and Descriptive Catalogue of the Arms Exhibited at the India Museum. With an Introductory Sketch of the Military History of India.* By the Hon. Wilbraham Egerton, M.A., M.P. Published by order of the Secretary of State for India in Council. London: Allen & Co.; W. Griggs, Hanover Street, Peckham, S.E. 1880.

by the natives. Another heavy piece, of brass, was taken at Bhurtpore. The Sikh artillery, though not quite so bulky, was far more effective, as we found to our cost. "Futteh Jung" was, however, a gun of considerable calibre, and played over our ranks during the eventful night of Ferozshah, till silenced by the determined advance of a small body of infantry in reply to Lord Hardinge, who went about the field and asked the "lads" if they "could not silence that gun." We think this cannon is still to be seen in the courtyard of the Government House at Calcutta. Some time ago the Indian Government called for a return of the forces and artillery still possessed by the native powers of India, big and little; and the replies sent suggested many curious reflections as to the nature of our tenure and ascendency in India, and the right policy towards tributary and feudatory Rajas.

Several of Mr. Egerton's anecdotes, if not absolutely new, are interesting. It did not come within the scope of his work to give us any proverbs or sayings save those which bear on warlike preparations. But when he tells us incidentally that the Bundelas, or inhabitants of Bundelkund, are of Rajput extraction, and haughty and independent, and that their "boorishness" has passed into a proverb, we are reminded of another current saying which designates them as highly accomplished cheats. *Ek sau dundi, na ek Bundelcundi.* "One hundred weigh-men are not equal to a single man of Bundelcund," however deceitful on the weights the former may be. Where he quotes Paulus Jovius, as quoted by Colonel Yule, for the statement that a good Persian blade would "cut through a silk handkerchief when drawn across it," we are reminded of Saladin's feat which astonished Richard and De Vaux in the *Talisman* as a sheer piece of jugglery. The quoit-throwing of the Sikhs rests on the ocular evidence of scores of officers. Mr. Egerton says casually that a Sikh soldier twists a thin circlet of steel round his forefinger and launches it with deadly aim at eighty paces. We have seen an expert of this race cut through the stem of a plantain tree with the *chakar* or quoit, at about that distance, but not without divers preliminary failures. But why, when dealing with Ranjit Sing and his Sikh army, does Mr. Egerton mention only two of the French officers under whose direction the Akalis and the Sikh artillery attained such excellence? To the names of Allard and Ventura, should be added those of Court and Avitabile, the latter a Neapolitan by birth, who spoke no one language, not even Italian, with correctness, but had the art of making himself obeyed, understood, and feared in his iron rule at Peshawur.

Mr. Egerton's work will be found especially useful to the antiquary and the collector of rare articles. We should have been glad if he had condescended to give us some specimens of the arms used by that estimable functionary, the *choukidar*, or village watchman, or of the *garāsa* and *surkhi*, or spears employed by clubmen and heroes of village fights in what are termed "agrarian disputes." But if there is any mention of such rude weapons, we have failed to hit on it. Attempts have recently been made to put the whole village police, especially in the Lower Provinces of Bengal, as regards duties, pay, and equipment, on a more satisfactory footing; and though this reform may be a work of time, we can state confidently that a better constabulary, the establishment of numerous subdivisions, and the greater number of officers, have resulted in diminishing the number of *lattials*, or hired clubmen, and in restricting fights about the possession of lands or the demarcation of boundaries to the proper arena of the civil courts. Very ugly wounds used to be inflicted in these encounters, which the police, with ample notice, some thirty years ago, were quite powerless to prevent. And notable feats have been accomplished with the watchman's clumsy spear with its broad blade. We remember an experienced collector, while engaged in the assessment of an estate, snatching a weapon of this kind from the hands of a bewildered official, and riding down single-handed and killing a good-sized boar which had been just started out of a patch of a cover during his morning's survey work. But the effect of arms, after all, whether rude or elaborate, depends on the skill with which they can be wielded; and not the least significant passage in this retrospect of Indian history is the remark of Bernier as to the quality of the Moghul soldiery. Mr. Egerton does not give the French Doctor's exact words, but, to our recollection, he was decidedly of opinion that twenty-four thousand men led by M. le Prince (Condé), or some other capable general, would walk over the bodies (*devraient passer sur le ventre*) of three times that number of the Imperial forces of Delhi and Agra. How Bernier's accurate forecast was verified a century afterwards by a rival nation makes up, as we all know, several volumes of stirring Anglo-Indian history.

FATHER PROUT.*

THE republication of a work chiefly humorous in intention, a long time after its original appearance, is perhaps a greater test of its excellence than is the case with any other class of literature. Nothing varies so much from time to time as the taste of the age in jests, and what survives must have an intrinsic excellence which is very far from ordinary. Even in the work of the greatest provokers of laughter there is much nowadays over which readers pass as rapidly as they can, and with smaller men the passing gets altogether the better of the reading. These are trite enough reflections, perhaps; but the republication of such a book as that before us suggests them somewhat pointedly. The renown of Father Prout is still considerable, though it is probable that for some years his readers have been but few. It was only in the year of Sadowa that he died, but he was even then more of a name than a reality to all except his personal friends. Thirty years had passed since *Regina* used to contain the *Reliques*, with Maclise's dainty illustrations of them, and during that time the author had given to the world little of any kind, and nothing that was not more or less ephemeral. He was personally familiar with most of the literary generation of 1830–1860, with Dickens and Thackeray and their compeers, and had become known (chiefly in Paris) to a younger generation of newspaper men, of whom he himself had always, though with some intermittences, continued to be one. But he lived little in England. He was that always questionable character, an unfrocked or half-unfrocked priest, and he never appeared before the public in his own person. The *Reliques of Father Prout* were reprinted once and again, and constantly gave a new and sometimes a considerable relish to boys with a taste for rummaging the shelves of their fathers' libraries. But they have long ceased to be much read, or even to be much quoted.

Few people, even if they have a very indistinct notion of the *Reliques*, need to be told that Father Prout was an eidolon, and that his name in the flesh was Francis Mahony. He was a native of the South-West of Ireland, a pupil of the Jesuits, and a priest, though for the greater part of his life not a very priestly one. Not very many details of that life are given in Mr. Kent's Introduction, and it is well to mention that the volume, though it may fairly enough pretend to be "The Works of Father Prout," has no pretensions, and does not make any, to contain all the works of Mahony. Its contents simply consist of the *Reliques* as they have been before now more than once published, and of a few waifs and strays principally from *Bentley's Miscellany*. Mahony was, as has been said, educated by the Jesuits, and he tried fairly enough to find a vocation in his profession. But he found none. Then he drifted to London and began to write the "Prout Papers" for *Fraser's Magazine*. Wilson had set the fashion of dialogue of a convivial order, and others had accustomed readers to miscellaneous magazine discussions *de omnibus rebus*. Mahony was by no means ill-equipped for such work. He had a good deal of miscellaneous reading, a knack of easy verse, a considerable fund of a certain kind of humour, and a few strong likes and dislikes to things and persons. It would be pleasanter to think that these dislikes were thoroughly genuine; but it is at least suspicious that during his journalist life he should have at one time been apparently a violent Conservative and at another a decided Liberal. Political reasons might, had he been more consistent, account satisfactorily enough for his dislike to Moore and to O'Connell; but somehow or other it is difficult not to recollect that these two were the most famous Irishmen of his day, and to see something of mere factious jealousy in the unrelenting way in which he pursues both on every occasion. It would indeed be rather difficult—perhaps the safer word would be impossible—to make out for Mahony any comprehensible bundle of beliefs. His ideas, critical, political, and other, always seem to have come to him in a more or less haphazard fashion, and he made no particular attempt to them fit together. His warmest admirers, however, would hardly claim for him any particular value as an exponent of opinion. Such reputation as he has is that of a humourist, and especially of a composer of humorous songs and parodies. A re-perusal of his book justifies this reputation to some extent, but only to some extent. Mahony had one original, or tolerably original, idea—that of writing paraphrases of well-known verses in languages different from that of the originals, and then holding up those originals as plagiarisms from his versions. For producing these curious *jeux d'esprit* he had no doubt a wonderful faculty. His French original of the "Burial of Sir John Moore" has indeed some faults of versification, but it is a really remarkable piece of mocking-bird music, and the same may be said of scores more of the lyrics so lavishly strewn about these pages. Unfortunately, however, the fancy struck him to weave numbers of these things into connected wholes, and the result cannot be said to be, at this time of day at any rate, fortunate. The "Rogueries of Tom Moore" would be a great deal more readable if the whole of the connecting prose were struck out and nothing but the versions retained. For the style of humour which was then prevalent in magazine-writing was, on the whole, heavy and constrained, so much so that it is not surprising to read of the mortifications which Thackeray underwent in the earlier part of his literary career. His touch must have seemed far too light, his humour altogether too airy, to those who preferred the floundering horse-play which Maginn and Mahony allowed themselves. Every now and then there are flashes, as, for instance, when the Father meets the argument that the *Melodies* are much better translations of his supposed originals than the *Anacreon* is of its own. But these are, on the whole, rare. The "Carousal" in which Father Prout entertains Sir Walter Scott is not exactly a *Cœna Deûm*, and the piece called "Dean Swift's Madness" is not only spoilt by its utter indifference to *vraisemblance*, but by the strange mixture of the serious and burlesque in it. Indeed Mahony seems never to have been quite clear whether he was writing seriously or not, and his work has therefore but too often the appearance of an awkward and badly joined mosaic. Still the verse, if not the prose, is well worth republication. The French and the Latin pieces are by far the best, Mahony having apparently a peculiar facility in those two languages. The Greek are for the

* *The Works of Father Prout.* Edited by Charles Kent. London: Routledge. 1881.

most part stiff, and the English very unequal. But in French or in Latin he had a really wonderful knack of catching up the main ideas and almost the words of an English poem, and reproducing them in a manner calculated to make the reader (with a little good will) believe that the relations of copy and original were reversed. Of the two, the Latin are even better than the French. It is said that the incomparable version of Ivanhoe's epitaph in *Rebecca and Rowena* is due to Mahony, and he was certainly fully capable of writing it, which is perhaps more than can be said of Thackeray himself. But, on the other hand, if the two friends' versions of *Le Grenier* are compared, Mahony is infinitely inferior. His practice in easy verse, written in languages somewhat unfamiliar to his readers, had led him into the habit of constantly using weak or otiose expressions to fill up a gap in rhyme or metre. So for

> Lisette ici doit surtout apparaître
> Vive, jolie, avec un frais chapeau,

he gives us the unutterably feeble

> O! my Lisette's fair form could I recall
> With fairy wand.

And for "le canon gronde," "*bronze* cannon roared." Who on earth cares whether they were bronze or iron? So, too, it is to be noted that his irregular Latin verse, where the scansion is merely by accent, and where rhyme is admitted, is far better than his attempts at pure quantity-metres on the classical model. There is hardly any comparison between the merits of "Lesbia hath a Beaming Eye" and of "John Anderson, my joe" in his versions. The merely accent-scanned trochees of the first are capital; the alcaics which do duty for the second are such as a sixth-form boy would hardly get much praise for.

It is curious to take Prout's work and to compare it with that of a somewhat elder contemporary of his, who, like him, was an ardent lover of the classical languages, like him had a great faculty of verse, and, like him, left work which is almost always humorous in intention. There is hardly a page of Peacock's work which is not interesting and delightful to read at the present day, while the pages of Prout which are really and honestly interesting and delightful now might, we fear, be collected in a much smaller volume than that which lies before us. The reason of the difference is certainly not to be found in the fact that Peacock wrote novels and Mahony essays; for, though the novel may be the more attractive form at the time, it far more rarely retains its attraction. It is rather to be found in the facts, first, that the one was above all things an exact and scholarly writer, while the other was in the last degree inaccurate and careless; and, secondly, that the one has infinitely more of the "critic of life" about him than the other. Mr. Matthew Arnold's favourite phrase may be a very bad definition of good poetry, but it is an admirable definition of good humour. Humorous writing that is to tell at all must deal with the facts of life, and that which is to continue to tell must deal with those facts of life which are more or less permanent. This is exactly what Peacock's writing does, and what Prout's does not. He is hardly in any sense an observer of actual life. He has before him an ideal, or rather conventional, sort of existence, in which the personages read books, sing songs, and drink whisky, but that is all. Every now and then, when he gets a little nearer to fact, as, for instance, in the paper on the Jesuits, he is at his best. So true is Thackeray's principle that the humourist is always more or less of a preacher, and can hardly dispense with something of a serious purpose.

For this reason Mahony is not likely, we think, to occupy any very exalted place in the literary history of the nineteenth century, and his book is likely to be less and less read as time goes on. It is essentially a book—we speak of it in the singular, inasmuch as his other work is of still less literary importance—to be subjected to the usually unfair process of selection. There might be made out of its verses a most pleasant anthology, and perhaps here and there a prose passage or two might be judiciously included in the salvage. But the papers, as a whole, cannot be said to be lively reading nowadays. Those which are chiefly literary reviews, such as the series on the songs of France and Italy, show good will, but little critical power, and a most deplorable habit of inaccurate statement. Those which are of a miscellaneous kind lack body and coherence. The present edition is injured by desperately small print and by extremely careless "reading," which has left the verses in foreign languages full of misprints and blunders of all kinds. But it is, considering its cheapness and the space at the disposal of the editor, fairly provided with introductory matter both to the whole book and to the individual papers.

THE MAHOMEDAN LAW OF INHERITANCE.*

ALL Mahomedan law is founded upon the Kurán, and is inseparably bound up with the religion of Islám: but, notwithstanding this unity of source, the number of sects and the diversities of legal interpretation are very numerous. Some sects, with their peculiar religious and legal doctrines, have passed away; but Mahomedanism, like all religions that retain vitality, still develops new views and new interpretations. Reason, experience, and expediency operate on one side; while a rigid adherence to the text and to old interpretations of famous commentators has a strong counteravailing influence on the other. The two great divisions of the Mahomedan world are the Sunnis and the Shias. The Turks, Indians, and Afghans are Sunnis; the Persians are Shias—generally, but not exclusively. Though the Mahomedans of India are in the main Sunnis, there are many Shias in the country, and the sect has been continually recruited by immigrants from Persia. Many a fierce and bloody religious quarrel has been fought out between the opposing sects in India, and the courts are frequently called upon to administer the law as interpreted by the Shias. The main point of difference between the Sunnis and the Shias is that the former recognize as lawful the succession of Abu Bakr, Omar, and Osman, the three Khalifs next after Mahomed; while the Shias altogether reject them, and declare that Ali, the son-in-law of Mahomed, was the true successor, and ought to have come immediately after him, instead of having his rights postponed till after the death of these three. Another great distinction, and the all-important one in a legal point of view, is that the Sunnis, as their name implies, are the people of the *Sunnah* or Traditions. The *Sunnah* embraces traditional accounts of whatever the Prophet did or tacitly allowed, and includes also the *hadis* or sayings which his hearers committed to memory and handed down to those who came after. These were not reduced to writing until after the Prophet's death; but they are regarded by the Sunnis as a supplement to the Kurán, and as being equal, or all but equal, to it in authority. The Shias reject all the traditions and rely solely on the Kurán; but, notwithstanding this, their sects and diverse interpretations of the law exceed in number those of the Sunnis. The works upon religion and law which have been produced by these two leading sects are almost innumerable. Some treatises have come down from very early times; but many must have been lost and entirely forgotten amid the wars and revolutions of the Mahomedan world. The Sunnis have four distinct schools of jurisprudence, each named after its founder. The most important is the Haníff, founded by Abú Hanífa, who was born in the year 80 of the Hijra (A.D. 699). This learned doctor had a true judicial mind, and gave great scope to reason in his interpretation of the maxims of the Kurán; hence his followers are known as "People of Reason." His teachings prevail in India, and his doctrines are those which our courts have principally to apply.

In the early days of British rule in India the Mahomedan law was administered both in civil and criminal cases. The criminal law was in many respects repugnant to European ideas of justice and humanity. Alterations and improvements were made which removed some of its most objectionable features; but the whole has long been swept away, and its place supplied by a Code which has gained a well-merited fame for its justice, humanity, and comprehensiveness. The Civil Law is still maintained in force by the British Government, and is administered to Mahomedan subjects in all cases relating to the devolution of property and to rights which have not been touched by the statute law of British India. Formerly the Civil Courts had Mahomedan law officers, whose duty it was to give expositions of the law applicable to the cases referred to them. This dependence on the professional opinions of lawyers whose qualifications were not always of the highest order, and whose probity was not entirely proof against suspicion, was neither agreeable to British judges nor satisfactory to the ruling power. In very early days translations were made of Arabic treatises on law, which gave the judges an insight into its principles, and enabled them to check the opinions of their law-officers. Other translations followed, and were succeeded by original treatises which have so thoroughly mastered the whole working of the Mahomedan law that judges are now independent of professional advice, and, under an Act passed in 1864, have to decide cases entirely upon their own knowledge and judgment.

The study of Mahomedan and Hindu law has of late years grown rapidly into favour among our own lawyers. There is of course the inducement of the material advantages which a knowledge of these subjects is likely to win for its possessor, and there is also the attraction which these remarkable and highly developed systems of law present to the scientific lawyer. The laws deserve the attention that has been given to them, and the works which the study has produced are worthy of the subject. Among these works the one before us holds a conspicuous and well-merited place. It is chiefly devoted to an exposition of the Mahomedan law of Inheritance, but it contains chapters on Marriage, Dower, Wills, and other matters which have to be decided for Mahomedans according to their own law. Practically it is a new work, for although the author published in 1866 a *Chart of Family Inheritance*, that occupied only 50 pages, while this fills nearly five hundred. The former work was recommended by the Civil Service Commissioners to the candidates selected for the Indian Civil Service, and this enlarged work will doubtless receive greater favour both at home and in India.

The Mahomedan law of Inheritance is a great triumph of legal science:—

> It comprises, beyond question, the most refined and elaborate system of rules for the devolution of property that is known to the civilized world, and its beauty and symmetry are such that it is worthy to be studied, not only by lawyers with a view to its practical application, but for its own sake, and by those who have no other object in view than their intellectual culture and gratification.

Our space will not admit of more than a few brief notices of two or three of its leading principles and of its *modus operandi*.

* *Moohummudan Law of Inheritance, and Rights and Relations affecting it.—Sunni Doctrine.* Comprising a Chart of Family Inheritance. By Alaric Rumsey, Barrister-at-Law, Professor of Indian Jurisprudence at King's College, London. London: Allen & Co.

The law recognizes no distinction between ancestral and acquired or real and personal property. It knows nothing of primogeniture, and, generally speaking, it does not admit right by representation. If a man leaves sons and sons of a deceased son, the latter are excluded, having no right as representatives of their father; and so, if a man leaves only son's sons, they take equal shares, *per capita* not *per stirpes*. The relatives of a deceased person are divided into three classes—Sharers, Residuaries, and Distant Kindred. The primary Residuaries are the son, son's son, brother and brother's son, uncle and uncle's son and "every male in whose line of relation to the deceased no female enters." No female relative is primarily a residuary, but females come in subsequently; thus a son takes two shares, the daughter then takes one. These are the heirs to the bulk of the estate after the claims of the specific sharers have been settled. The sharers are twelve in number—four males and eight females. The males are the husband, father, grandfather, and brother; the females are the wife, daughter, mother, grandmother, sister, &c. The share of a husband is $\frac{1}{4}$ when there is a male descendant, $\frac{1}{2}$ when there is not; of a wife or wives, $\frac{1}{8}$ in the former case, and $\frac{1}{4}$ in the latter; a father or grandfather's share is $\frac{1}{6}$. It is obvious that in default of nearer male heirs, some of these "sharers" may be the "residuaries." In apportioning the property of a deceased person the first business is to settle the rights of the "sharers." Mahomedan lawyers have framed a number of minute and artificial rules applicable to particular classes of cases; but all questions of apportionment are easily solved by the processes of arithmetic, by bringing the fractional shares down to a common denominator. Mr. Rumsey gives a great number of illustrative examples, of which the following is one of the most simple. The claimants to an estate are the wife, mother, and two sons. The wife's share is $\frac{1}{8}$, the mother's $\frac{1}{6}$, the two sons as residuaries divide the residue; so the wife gets $\frac{6}{48}$, the mother $\frac{8}{48}$, and each son $\frac{17}{48}$. When there are several varieties of sharers, the common denominator is sometimes very high, in one of the examples it is 4,320 and in another 5,040. The cases of inheritance which present themselves for settlement are almost infinite; but the principles upon which the division of an estate has to be made are so clear that a very small per-centage of cases come before the law courts; they are settled by the parties themselves, assisted by their legal advisers. Mr. Rumsey's book so clearly explains the principles, and so fully illustrates them by examples, that if every possible contingency has not been provided for, the means of solving it can be discovered and applied.

Mahomedan law recognizes the testamentary power, and every person of full age may dispose by will of one-third of his property after payment of debts and funeral expenses. No man can wholly disinherit his heirs without their consent; but in the extreme case of a person having no heirs the whole property may be conveyed by will. Mr. Rumsey gives two chapters on Marriage and Dower, and, indeed, no work on Mahomedan inheritance would be complete without some notice of these subjects. Marriage carries with it rights of inheritance, and the dower settled upon the wife may, and often does, interfere with the rights of the ordinary heirs. Dower is held to be the price promised or paid by the husband for possession of the wife's person. If unpaid, it is a debt on the husband's estate. It takes precedence of all claims by inheritance, and descends by inheritance to the wife's heirs. The amount of dower is entirely arbitrary, and varies according to the position in life, and the youth, beauty, and accomplishments of the bride. It is settled by the relatives of the contracting parties; but if a marriage has been agreed upon and the amount of dower is disputed, the magistrate has authority to determine the just amount. Divorce is a very easy matter under the Mahomedan law, and may be effected at the mere will of the husband; but a man cannot repudiate his wife without paying her dower; so it sometimes happens that a very ardent lover, or one willing to divest himself of the power of divorce, will agree to an amount of dower which it is quite impossible for him to discharge. From this there is no escape but payment, or remission on the part of the wife. A free man may not have more than four wives at the same time; a slave may not have more than two. There is a long and well-defined table of "Prohibited Degrees," and this includes not only relations by blood, but, generally speaking, those also who stand in the same relation by fosterage. Free persons cannot marry their own slaves, because parents have by law an equal right in their offspring, and this right is incompatible with the position of owner and slave. Mr. Rumsey lays down the law that "An usufructuary marriage, *i.e.*, where a man says to a woman 'I will take the use of you for such a time for so much,' is void; so also is a temporary marriage (*e.g.*, a marriage for ten days), whether for a short or for a long time." This is strictly accurate as regards the Sunnís, with whom this work is concerned; but it is one of the points on which the Shías differ from them. A verse of the Kurán has been interpreted by the Shías as warranting such a temporary marriage; the Sunnís, by the help of their traditions, have come to a different and certainly a more moral interpretation. Kings and great men have occasionally availed themselves of the diverse views of the different schools to obtain legal sanction for irregular practices. They have known where to seek the required authority for their backslidings, as professional men at home know where to look for scientific opinions in support of particular views. There is a curious case on record upon this very point of a temporary marriage. A certain King of Bidar in the fifteenth century is described as being very orthodox and a great admirer of the fair sex. He complained to his Sunní lawyers of being limited to four wives, and desired to know how he might marry more. They could only help him by pointing out that, although he could have only four at a time, he might divorce one wife and marry another as often as he pleased. This was not what he wanted; so he addressed himself to a learned Shia who was present at his Court. From him he obtained the opinion that a *mutah*, or temporary marriage, was legal, and had been practised in the time of the Prophet. This exposition was contested by the Sunní lawyers, and a long discussion ensued with a foregone conclusion on the King's part. He was satisfied that temporary marriages were recognized in the days of the Prophet, and so he married eight hundred women in one day. This Solomon of India had not only wives from every country in India, but Chinese and Afghans, Turks and Europeans, and it was his boast that he was able to speak to each one in her own language. He must have exceeded his great prototype in tact and wisdom, for he treated them all so kindly that each wife is said to have thought herself the best beloved. It must be observed, however, that he kept them separate; each wife had distinct apartments, and was attended by servants of her own country.

The book under notice has received the approbation of the Civil Service Commissioners and their advisers, and it will, no doubt, come into general use in India. It is already a text-book for students, and must become a book of reference and authority indispensable to all engaged in administering Mahomedan law. A further edition will probably be needed ere long, and Mr. Rumsey would probably do well to have in readiness a Supplement containing an exposition of the more important variations of the Shia doctrines. They are curious in themselves for lawyers interested in studying the growth and divergence of laws, and, though not so necessary in practice, the adjudication on Shia disputes will occasionally, and in some districts may frequently, fall to the lot of an English judge.

LIZZIE OF THE MILL.*

THOUGH the German novels which are now so often introduced to us in an English version do not differ much in point of construction or plot from those of our own country and age, yet they generally have a certain merit of their own. There is, of course, the usual love-making and the proper allowance of good and bad characters. Heroes and heroines behave much as they do with us; while obstacles of the same kind are piled up in their paths, to be cleared away by the means which we all know so well. In fact, these German novels, as well as ours, run a course that is very much like that of a fever. Day after day the patient's temperature rises, his pulse beats faster, and the complications of his disorder increase, till even the experienced doctor and nurse become alarmed; when one night he most unexpectedly falls into a refreshing sleep, and wakes next morning weak, no doubt, but out of danger and on the fair way to a rapid recovery. So is it with the plot of a story, whether it be written by a German or an Englishman. It opens with a slight complication which steadily grows greater, till at last it seems as if it must enfold hero and heroine alike with utter misery; and then, after it has run its proper stage for rather more than two-thirds, or perhaps three-fourths, of the book, a sudden change takes place, and all the good characters become as happy as before they had been miserable. But, though there is this uniformity in all modern novels, yet a certain agreeable variety may be derived from the people among whom the scene is laid. We are, we are sorry to have to own it, heartily tired of the heroic characters of our own race. We are familiar with them in every rank of society, from dukes and duchesses down to the dwellers in the lowest courts in Whitechapel or St. Giles's. We do not know whether we could not manage to exist very comfortably for a whole twelvemonth without making the acquaintance of a single new hero or heroine. We feel towards them—those, we mean, of our modern novelists—much in the same way as a traveller in Spain, at the end of his first week, feels towards all the dishes that are set before him. Garlic may be good, but, considering that its taste is very strong, it may impart a disagreeable sameness to a meal when it is introduced into every dish. In like manner, the heroic seasoning—if we may venture to use the expression—that writers use at present for their tales, if it is not wanting in strength, certainly is wanting in delicacy and variety. Now in these German stories we often find described a simple kind of life which is interesting enough to read about. There is a homeliness in the people which unhappily is no longer found to anything like the same extent in England. It reminds us more of the middle-class life that Scott has so admirably and so often described, with its hospitality, its simplicity, and its absence of formality. In the household of Herr Erving, the rich paper-maker, the father of Lizzie of the Mill, who gives her name to the story before us, we have an instance of that kind of life which tradesmen led before they had begun to trouble their heads about what might be thought of them by those who were born in a higher class. It is a simple, comfortable home, unspoilt by any of the apings of gentility. When next we travel in Germany we shall account ourselves fortunate should we chance to meet the worthy paper-maker on the bridge close to his house. We are sure that he will give us a courteous welcome, and we are quite as sure that we shall at once accept it. Though his daughter is a most charming young lady—indeed a model heroine—yet we do not feel equally sure about visiting her at Derenberg Castle hard by. She will not, we know, have been in the least spoilt by be-

* *Lizzie of the Mill.* From the German of W. Heimburg. By Christina Tyrrell. 2 vols. London: Richard Bentley & Son. 1880.

coming a Baroness; but, to tell the plain truth, we do not care for her husband the Baron. The author, it is clear, means him for an heroic character, though one which till close on the last chapter is marred by certain imperfections. We can only look upon him as a very poor, pitiful creature, who much more deserved to be ducked in the mill-stream than to win the hand of the miller's beautiful daughter. There was, however, a good deal to be said for him by way of excuse. To begin with, though a gentleman, he was a marvellously poor one. He had, moreover, a most despotic and haughty old grandmother, who ruled the whole household with a rod of iron, and had brought up her grandson with the fullest sense of his own importance. She was a dreadfully wicked old lady. Years before the story opened, she had, by her slanders, not only caused the death of another Lizzie of the Mill—the heroine's grand-aunt—but also the utter ruin of her brother-in-law, Baron Fritz. By her extravagance she had brought down the family almost to beggary; moreover, it was owing to her that her only son, the hero's father, had ended his life by his own hand. The wrong that she had done to the first Lizzie made her hate the second. When children, the hero and his sister Nelly had been the playmates of the miller's little daughter. As they grew up the friendship between the two girls grew stronger, but the young Baron yielded to his grandmother's influence, and left off visiting at the Mill. Poor Lizzie had meanwhile fallen over head and ears in love with him, but found herself only slighted.

One day the Baron was shown by the wicked old lady a book in which was contained a history of his family. He read about a certain Agneta Maud Derenberg, who had had, if her picture was to be trusted, a remarkable head of hair. It was "a cloud of luxuriant golden, nay, red hair, drawn back from the white brow, and confined in a little cap of some silver tissue." The painter, by the way, must have had no small skill in his art who could paint a cloud when it was drawn back and confined. Be that as it may, the old family chronicler had thought it needful, in describing this lady, to quote an ancient proverb which says,

> But, beware! Look to the hairs!
> If redde, be sure 'twill prove a snare!

The reader's attention is at once roused, for he feels quite sure that with the first red-haired woman that the hero comes across he will straightway fall in love. As yet we had only made the acquaintance of his sister Nelly. She, of course, might have been a source of danger to some other young man, but, though she had "a wealth of fair curls," we do not make out that they were red. What, we ask ourselves, will be the colour of the locks of the as yet unknown Lizzie of the Mill? We hasten on with the story, and soon, to our great satisfaction, discover the usual signs of the near approach of a heroine. The author makes a great call upon his own powers and upon those of nature too. We come upon such a passage, for instance, as the following in the midst of a great deal of fine writing:—"Over the whole landscape lay the rosy shimmer of the setting sun, declining gradually in the far horizon in a violet sea of wondrous hue." We no more doubt that the heroine is but a page or two off than we doubt that on the stage a great king or conqueror is approaching when the supernumeraries come marching in two and two in scarlet tunics, with halberds on their shoulders. But when the heroine does make her appearance, we find that her hair is brown. Patience, we say to ourselves, and read steadily on. Before long we are rewarded. We hear first of a rich childless aunt of the young Baron's, who might restore the fortunes of the family by dying at a convenient time, and leaving her nephew all her money. She has, however, an only niece Blanche, and to her, of course, she might leave everything. The wicked old grandmother schemes a marriage between the young people. Meanwhile, till we know the colour of the niece's hair, we cannot ourselves come to any conclusion about the proposed alliance. The hero goes off to make her acquaintance, and at once our alarms are raised. About the dangerous colour of her hair there could not be a doubt. A golden fringe glistened on her forehead, and down her back flowed a wealth of luxuriant golden-red hair. It formed an aureole round her pale face, and fell like a shining veil about her shoulders. It was a golden glimmer, a golden flood, and a cloud of gleaming red hair. Nay the author's powers of description are not even yet exhausted. He makes one more effort, and we read that "down the fairy's back rolled masses of luxuriant, wonderful red hair." The hero, being a young fool, of course despised the family chronicler, did not beware, but looked to the hair only much too much. It was red, and it did prove a snare. Everything goes as wrong as can be for many a chapter. Poor Lizzie is forgotten, and the Baron and his cousin become engaged. Happily, just when the heroine seemed on the point of breaking her heart, the old aunt dies, and leaves all her property to the fair one of the golden glimmer of the wealth of luxuriant red hair. She at once jilts her poor cousin and so fulfils the warning of the proverb. He is heart-broken for at least four-and-twenty hours, when suddenly he discovers how fond he had always been of Lizzie and how fond she had always been of him. He proposes and is at once accepted. The course of love does not, however, run smooth at once, for he is naturally looked upon with great suspicion by the old paper-maker, who no doubt, not being well read in modern novels, did not understand with what rapidity it is possible to fall out of love and into it again. However, at last everything is cleared up, and everybody seems to be quite satisfied, except the wicked grandmother and, perhaps, the reader. We, at all events, as we have already said, are by no means pleased to see so charming a heroine fall to so pitiful a hero. We shall think even worse than ever of foreign barons if this fellow is to be taken as one of the best of them.

Certainly the conclusion of the story is not only very inartistic, but it drags greatly. Yet the book, as a whole, is prettily and pleasantly written, while one or two of the characters are very well drawn. The translator has done her work well, and does not often let German idioms peep up in the midst of English words. We could have wished, however, that she had kept clear of the silly phrases of our novelists, for which we greatly doubt whether their counterpart is to be found in the original. If the author affects fine words with very little meaning, the translator has done right to seek their equivalents in English; but if he has written, as we feel almost sure he has, simple German, she would have done well had she also written plain English.

THE DICTIONARY OF CHRISTIAN ANTIQUITIES.*

UNIFORM with the important *Dictionary of Christian Biography* now in course of publication, and of which we have spoken on two occasions, this *Dictionary of Christian Antiquities*, just completed by the appearance of its second volume, forms, together with it and the well-known *Dictionary of the Bible*, that great trilogy of ecclesiastical cyclopædias which we owe to Mr. Murray's enterprise, seconded by the skill of Dr. Smith and his coadjutors. Taken together, the three series leave little or nothing to be desired. The use of these most convenient and comprehensive manuals will no doubt supersede in a great measure that independent research which is so useful—for its indirect as well as its immediate results—to all young students. On the other hand, the accumulation of such a mass of varied learning, in a form most convenient for reference, and at a (comparatively speaking) small cost, cannot but be advantageous even to advanced scholars who have ample time at their disposal and means of access to considerable libraries. These invaluable books of reference form, indeed, for the ground which they cover, a complete library in miniature.

The work before us is unusually well done. It begins at the period at which the *Dictionary of the Bible* left off, and it extends to the time of Charles the Great, thus excluding the middle ages, properly so called. A hint is given in the editorial preface that the later developments of Christian ritual, the history of the great monastic and mendicant orders, and the several arts and institutions of the middle ages, may form the subject of a further separate publication. The two volumes now before us are to the archæology of the earlier Christian Church that which the well-known *Dictionary of Greek and Roman Antiquities* is to the public and private life of classical antiquity. We find in them almost all that can be gathered together about the organization, the discipline, the geographical extension, the legislation and revenues of the Church; the social life of the first Christian ages; the churches and buildings, the worship and ceremonial, the hagiology and the symbolism, and the general archæology of the first ten centuries. Dr. Smith has been the general editor of the whole work, assisted in the first volume by Dr. Stubbs, Professor Plumptre, and Archdeacon Cheetham, and in the last volume by Archdeacon Cheetham alone. The number of contributors to the work would have to be counted by scores.

There are very few depreciatory criticisms to be made on these volumes. It is a misfortune and a serious mistake that the scholars who have undertaken the ancient martyrologies and Church Calendars have contributed the names of so many saints to this series rather than to the *Dictionary of Biography*, to which they certainly more fitly belong, and where a student would certainly first look for them. The editors say, indeed, that they have reserved the "lives" of these personages, "when they are of any importance," for the biographical series, reserving their names and days of commemoration for this branch of the work. But this arrangement is unintelligible and perplexing. Of "St. Gall," for example, we are here only told that he was a "presbyter and confessor in Germany, commemorated February 20," without any hint of his date. Why should an inquirer have to search for further information by another reference to another volume?

Dr. Smith made, it must be confessed, a very judicious choice of colleagues in the present undertaking. He entrusted Dr. Stubbs with the whole branch of the subject which includes the laws, the government, the discipline, and the revenues of the Church and its religious orders, and Dr. Plumptre with the treatment of the education and social life of the earlier Christian ages. Both these gentlemen, however, were obliged, as the work proceeded, to request to be relieved of their engagements by the pressure of other duties. Professor (now Archdeacon) Cheetham succeeded to their posts, in addition to the responsibility for all that concerns Christian worship and ceremonial, which had been his department from the beginning. The regretted deaths of Bishop Forbes of Brechin, of Mr. A. W. Haddan, and Mr. Wharton Marriott, deprived the staff of three most qualified members; and the elevation of Dr. Benson and Dr. Lightfoot to the episcopate must have hindered not a little their literary engagements. But the work has not materially suffered, in respect of ability or completeness, by any of these changes.

There are numerous excellent illustrations to the two volumes

* *A Dictionary of Christian Antiquities: being a Continuation of "The Dictionary of the Bible."* Edited by William Smith, D.C.L., LL.D., and Samuel Cheetham, M.A., Archdeacon of Southwark. 2 vols. Illustrated by Engravings on Wood. London: John Murray. 1875 and 1880.

before us. They add greatly to the lucidity and general value of the text. We observe that not a few of them are not original, more especially those which illustrate the structure and the art of the Catacombs. But this, perhaps, was unavoidable. The Catacombs are undertaken in all their branches by Canon Venables, who also supplements Mr. Alexander Nesbitt in the department of what is called Ecclesiology. Mr. St. John Tyrwhitt is responsible for all the purely artistic articles in this series.

It is almost impossible to give any idea, still less any criticism, of the mass of learning here accumulated. Few subjects are more thoroughly treated than that of "Lamps," by Dr. Churchill Babington. The illustrations of this paper are most instructive. The "Lighting of Lamps" is made a separate article, contributed, with great fulness of knowledge, by Mr. Hotham, the Vice-Master of Trinity College, Cambridge. To this gentleman, we observe, the whole branch of Oriental liturgical antiquities has been committed. But the subject of the "Ceremonial Use of Lights" is treated by an even more competent writer, the Rev. W. E. Scudamore, author of the *Notitia Eucharistica*. This is, in many respects, a remarkable paper from its great research and excellent common sense. It undertakes to prove that for the first three hundred years of the Christian Church there was no ceremonial use of lighted candles, torches, or lamps in the daytime in divine worship. But it is shown that in the fourth century, partly in honour of martyrs, partly as a means of festal decoration, lighted candles or lamps became not uncommon. And the facts that the Eucharist was celebrated at very early hours, and that during the ages of persecution it had often been necessary to hold Christian worship by night or in dark sanctuaries, made it easy in later times to introduce the ritual use of lighted tapers. "The necessary lights of this period," says Mr. Scudamore, "became the ceremonial lights of the next." Of course the service of *Tenebræ* is an exceptional usage. But the Paschal candle seems to have been authorized early in the fifth century. And baptismal lights, a most significant symbol of "illumination," were certainly in use in the preceding century as well as the gospel lights in the Liturgy. At funerals, too, lights, both stationary and processional, were used certainly in the time of Constantine. St. Gregory of Nyssa, A.D. 380, describes the funeral of his sister, St. Macrina, at which "no small number of deacons and subdeacons preceded the corpse, on either side, escorting it from the house in orderly procession, all holding wax candles." From this it was a natural consequence that lights should be kept burning at sepulchres or shrines. It was probably a sensible and useful thing to discourage the excessive use of lights in divine service at the English Reformation. But it can scarcely be supposed that those who ordered two lights only to be retained on the altar, for a symbolical reason, ever imagined that it would be understood that these candles were to be unlighted. We give this brief account of Mr. Scudamore's paper merely as a specimen taken at random of the subjects treated of in this Dictionary. We only notice one or two omissions in his essay. He has not observed that suspended lamps are represented as ornaments of the sanctuary in the mosaics, for example, of many of the churches of Thessalonica, as figured in Messrs. Texier and Pullan's book. Nor does he refer to the Jewish seven-branched candlestick, which was so likely to have a counterpart in early Christian worship. The Seven Lamps, also, of the Apocalypse cannot but have suggested a precedent for the ceremonial use of lights in the Christian Church.

We turn, for another sample of the work, to Mr. Hotham's article on "Litany." It is very thoroughly done, and is a great contrast to the stereotyped meagre information which is commonly given in books of reference on these subjects. He speaks at length of the long intercessory prayers, in the form of a litany, which are found in the introductory or *proanaphoral* parts of the Greek liturgies. But he fails, we think, to observe the full importance of this fact. These liturgies go back in substance to the earliest Christian period. It may be concluded, then, that a Litany, as such, is an expression of united Christian prayer, the peculiar type of which has come down from the very first. It has always seemed to us that the Greek liturgical litanies are like a background to the whole office. The English Litany—a most noble specimen of its kind—was probably meant to be used as an introduction to the Communion office. And this was perhaps a kind of reminiscence of the Greek usage. Mr. Hotham strangely gives a separate article on the word *Lite*. Surely λιτή and λιτανεία were only synonyms, as indeed Codinus, who held the office of *Curopalate* in the court of the last Emperors of Constantinople, and who may therefore be presumed to have known, expressly declares.

The musical articles are contributed partly by Mr. Hullah and partly by the Rev. J. R. Lunn, late Fellow of St. John's College, Cambridge. The papers by Mr. Lunn are prodigiously learned. He has succeeded in explaining the earliest musical notation, as found in manuscripts, before Guido of Arezzo invented the stave in the eleventh century. A very excellent paper on the Holy Sepulchre is contributed by Mr. Walter Besant, Secretary of the Palestine Exploration Fund, who is unusually well qualified for the task. The writer, after giving the history of the controversy, discusses the two questions—whether the present site is that which was fixed upon by the officers of Constantine; and whether that site was certainly, or even probably, the true spot where Our Lord was buried. Most impartially all the arguments on both sides are adduced and discussed and weighed. But no conclusion is arrived at, though the writer's prejudices seem to go in behalf of the received site. The controversy is thus judiciously summed up:—

> It will be seen that, while no amount of argument will ever reconcile those who hold opposite views as to the continuity of tradition from the earliest times, the continuity of history from the time of Eusebius appears fairly demonstrable. On the other hand, if it cannot be disproved by architects that the Dome of the Rock is of the age of Constantine, what way out of the difficulty remains but one, that pointed out by Mr. Fergusson, itself bristling with other difficulties? A careful and exhaustive examination of this building on the spot by a thoroughly competent architectural scholar is greatly to be desired. That indeed seems the chief thing necessary. The next step, if it should not be the first, is the recovery beyond any doubt of the second wall. These two desiderata accomplished, and the rock-levels of the city—already far advanced—completed, the question of the site of the Holy Sepulchre will be narrowed to one or two issues.

It has always seemed to us that the determination of the line of the second wall was the one great thing to be desired and attempted. In conclusion, we may point to an invaluable list of ancient monasteries, 1,481 in number, most useful to an historical student, contributed by Mr. Wensley; and a still more important essay on Money, illustrated by many plates of coins, by Mr. Keary, of the British Museum, assisted by Mr. Babington; the latter of whom adds a supplemental section on Medals.

A more acceptable present for a candidate for Holy Orders, or a more valuable book for any library, than this *Dictionary of Christian Antiquities*, could not easily be found.

OUR SONS.*

MR. ARTHUR KING has been careful in the first page of his introductory chapter to indicate the class of readers whom he proposes to instruct and assist in the best methods of providing for "the increasing number of curly heads round the table." He gives out his text at the opening of his discourse, and it is no other than the sentence in the Psalms from which English-speaking folk have taken the proverbial "quiver." His readers are therefore to be sought in the class—and it is beyond question an extensive one—which considers the quotation appropriate, and its doctrine "necessary for these times." It has never occurred to these worthy people to examine critically into the patriarchal view of the value of blood relations, and to trace its survivals in an Irish faction-fight, or in the "compurgators" to whom the British juryman owes his being; nor have they even given themselves the trouble to remember that the name of King Solomon, with which the sentiment or its authorship is associated, suggests the existence of a domestic institution in direct relation to it as means to an end. Nothing can possibly be further from the wish of the respectable householders to whom Mr. King addresses himself than that their sons should "speak with their enemies in the gate." The nearest modern approach to the practice is to be found in systems of conscription and compulsory military service, and these the British householder utterly abhors.

As matter of experience, however, the father of the "curly heads" which in due time will adorn the shoulders of "three or four healthy lads of from 12 to 17 years of age eating him out of house and home" is anything, in the author's judgment, but happy; and the object of this work is to administer the consolation needed in his unhappiness, and "to assist parents, guardians, and all interested in the well-being of their sons in the choice of such an education" as may diminish the now unfortunately existing number of "logs upon the water." We remember in some work which was intended to instruct and more or less to amuse the infancy of a former generation—it may have been *Evenings at Home*—how the Mr. Barlow of the occasion called his young friends round him and proposed to found a colony. Volunteers at once came forward to fill the posts of baker, carpenter, and so on in the infant settlement; but one "young friend" of higher aims simply announced his intention of being "a gentleman." Our memory is a blank upon the improving moral lecture which Mr. Barlow proceeded to deliver; but Mr. King is far more tolerant of human weakness, whether filial or paternal. "In the colonies a man must be prepared to face harder work in a much worse climate. The work is so rough, that the most fortunate men are to be found in the artisan and labouring classes." "Our Sons" must be "started in life" as gentlemen; with dress-coats, lawn-tennis shoes, and every other requisite for subduing, not exactly the earth, but the world, which is a much more important consideration. This is the aspiration of the moneyed or the comfortable middle classes, and, to a certain extent, of all educated people. No one likes to face the prospect of his children's descent to a lower social level than his own; and no one, accordingly, in the educated or middle class is prepared to see his son earning his bread by direct manual labour—least of all if he has himself risen from the ranks of such labour. It is a convenient platitude of politics that the fabric of the State holds together more firmly when its threads are closely interwoven than when they are arranged one above another in layers, and the maxim is cordially accepted by the fortunate occupants of the surface. Its force is not quite so clear in the case of the threads which pass downward out of sight, and the class distinction which separates the employer from the labourer is more strongly marked in days of great undertakings and abundant capital than it was when, both in agriculture and trade, masters and men were on a nearer social level and often sat at the same table. The condition present to the mind of the author of *Our Sons*, that they must at all events be started in life as gentlemen, is evidenced by a curious, though intelligible, reticence on subjects almost or altogether forbidden by the conventional canons of his

* *Our Sons: How to Start them in Life.* By Arthur King. London: Warne & Co. 1880.

readers. Among possible callings open to a lad in our time, the merchant service, or, as it is now called, the "mercantile marine," could not be altogether omitted. But it is not fashionable; there is no broad line of distinction at any point between the dignity of the "P. and O." at one end and the dinginess of a Newcastle collier at the other; and the "mercantile marine" is accordingly dismissed with twenty lines of notice at the end of the volume. A more transparent omission is found in the absence of any notice whatever of the openings in life presented by retail trade. Mr. King knows his readers far too well to suggest the possibility of any "openings" in life which may lead through a hinged flap behind the counter. At the same time, an underlying, though suppressed, premiss may be detected throughout the whole book. It is assumed that the parents for whom the author writes have money to spend on their sons' education; and, further, that the range of their own experience as to the best way of spending it, or of their opportunities for obtaining private information on the subject, is not extensive. Schoolmasters will be at no loss to account for the facts of social life which are thus taken for granted; and these probably fall more directly under the observation of the masters of preparatory schools, whose relations with the parents of their pupils are more confidential than those of public head-masters. As a boy grows older he is thrown more on his own resources; the little boy just leaving home is an object of greater solicitude, especially on the part of his mother, who in many instances carries on all the correspondence by letter with the head of the school establishment. The father, after a first interview, "wires" at intervals, or encloses a cheque with a headed "memorandum." But the first interview has explained everything. With the rapid extension of trade a great deal of money has been made by men who frankly own that they never had the chance themselves of an education such as they wish to give their sons; and as their families grow up it is often observed that the younger boys come to school with a distinctly increased measure of refinement as compared with the elder lads at the same age. The experience of parents in this class is necessarily much confined to the work in which they have been themselves engaged, and neither they nor their friends have had great opportunity of becoming acquainted with the details of, or the requisite preparation for, the professional life for which most of their sons are designed. Of public schools and universities they know scarcely anything, while professional men and others who have received what used to be described as a liberal education know, or have the means of ascertaining, almost everything which Mr. King can tell them, and are only at a loss in the matter which he appears to regard as a "postulate"—the possession of the requisite balance with their bankers.

Our Sons is a book which fairly provides, as it professes to do, "a manual of useful information" as to the cost and character of the education afforded by the various public schools and by the Universities, and also as to the cost and method of special preparation for professional life. The advice which the author offers is made to rest, to a certain extent, upon a principle which, without disputing its soundness, we may characterize as somewhat cynical, and which certainly will not commend itself to the acceptance of many a proud and admiring mother. This is, that hardly any boy "has any special aptitude for any particular profession or branch of business more than another"; and, as an illustration of the common blundering of domestic opinion upon this head, he makes much sport of his own too partial family, which had set him down as a born artist in his early infancy, whereas, in his maturer life, "when a four-year-old child of my acquaintance asked me to draw the conventional cat upon her slate, I was obliged with shame to confess my inability." This reasoning, however, appears to be open to the objection of *non sequitur*, if, as we believe, by "the conventional cat" is meant the ground-plan of a traditional visit of one Thomas to his friend Christopher. Mr. Arthur King probably only "confesses his inability" to remember the succession of incidents in that simple but instructive romance. A wide margin for exceptions must, we think, be allowed to the advice, "Let every father, as soon as his eldest son has reached the age of 12, set himself seriously to consider what is to be the boy's future career." Neither bodily nor mental development has sufficiently advanced in the generality of boys at twelve years old to allow of any fixed decision as the consequence of this consideration.

There is much worldly wisdom in the following counsel, which is, indeed, offered only as an alternative. "Two distinct ways of living" are open to a father's desire for his son; the one, "to work hard and make money, with a considerable chance of failure"; the other, to be content with a moderate income, little or no risk, and spare time for culture. To those who prefer the former prospect the following advice is given:—

> If a father is bent upon seeing his sons rich men, let him start them early in life in a money-making business, with the largest capital he can place at their disposal, and let him be careful that the education they have had be one that has taught them little more than the actual knowledge they will require in their business transactions; as complete a knowledge of modern languages as possible, and as thorough an acquaintance with figures as can be gained, putting out of sight any considerable learning in the way of classics or mathematics; and, above all, let the business he chooses be the one in which he can command the most influential interest and largest connexion, for without these most important elements in success the fight will be a very uphill one indeed. . . . In the professions connexion is the only advertisement that can be correctly made use of, and the greatest genius may, without friends to make him known, languish unknown for years at the bar, in the church, or as an obscure parish doctor.

The converse to the latter portion of these generalizations from the author's "experience over a wide range of professions" was concisely stated as regards one path of life by Cowper in the last century:—"The parson knows enough who knows a duke." A careful following of Mr. King's advice cannot fail, during periods when the tide of trade is at its flood, to result in a conspicuous increase in the numbers and the force of the British Philistine, who, when trade is bad, or when he has retired on his fortune or on his misfortune, and generally in the later years of his life, having no resources except those which may be set down in "figures," no tastes save those to which his cook or his butler can minister, scarcely a book in his library and no ideas in his head, is apt to become an extremely disagreeable person in his family circle, and a nuisance as far as his power extends to all the neighbourhood beyond it.

The details of information which Mr. King has collected are well arranged and generally accurate, although in some cases they appear not to have been corrected to the latest date. The old tradition of Oxford which made the private tutor an essential element in the life of the reading man is now almost, if not entirely, of the past. The College tutors and lecturers work so hard themselves and make their men work so hard for them, that the occupation of the private tutor is gone. Grey-whiskered patriarchs come up from the country with the pleasures of memory shedding a radiance round the pleasures of hope as they reach the Oxford station in the mellow afternoon; but they return lamenting. They dined in Hall—there was nothing but toast-and-water on the table; they went to the Common Room, and it broke up after a single bottle of claret. It was never so in their time; and even now they will hardly believe their ears when they are told of College lectures, to say nothing of undergraduates coming in with their papers, at eight and nine o'clock. Certainly among the various openings by which "our sons" may now be "started in life," the good old comfortable career can no longer be reckoned where the lad of sixteen came up from a country grammar school on a close scholarship, took a pass in due time, or, if he was very studiously inclined, a third class, and then settled down on a fellowship and port wine till the revolving wheels of time and patronage brought him after middle age to a country rectory and a wife.

Mr. King has wisely remembered to point out a truth which is not the less important because it may seem to be a truism, that "home cannot be made too pleasant to a boy," and that "nothing can be more painful" to him in the present or more injurious to his future than that "he should have ever present to his mind a dull and gloomy house of correction, from which return to school is an escape to be looked forward to with joy." This is a principle which extends far beyond the school days; and, where and so long as it is possible, the home should be made to fulfil the conditions of a military base in relation to the campaign of life.

WENDISH FOLK-LORE.*

THE Wends of Upper and Lower Lusatia are but a small people, whose Slavonic nationality is fast being absorbed in the great German wave which surrounds them on every side. In spite of the efforts made by enthusiastic patriots to publish books and newspapers in Wendish at Bautzen and elsewhere, the language is dying out, and will, before very long, be remembered only by philologists. But the memory of these Lusatian Wends will long be kept alive among comparative mythologists and students of folk-lore by the rich stores of popular fiction which have been gathered from Wendish lips, some years ago by MM. Haupt and Schmaler, and now by M. Veckenstedt. In his *Wendische Sagen* he has brought together, and arranged in the most methodical manner, a very great amount of information concerning the legends and superstitions of the Wends, chiefly of Lower Lusatia. And he has been so fortunate as to find among those isolated Slavs, the most Western branch of the Slavonic family, evidence as to ancient beliefs in mythological beings whose names are unfamiliar to the other sections of their race.

These beings all belong to the demon class, and the belief in them dates back to those heathen times in which the Wends were a numerous and powerful people, occupying a wide extent of territory, and inspiring with no slight awe their Teutonic neighbours. Corresponding forms to theirs are still found in all Slavonic lands; but the names of some of the Wendish bugbears appear to be peculiar to their Lusatian home. Of such a nature is the Fika, a tobacco-smoking fiend. Tradition relates that she was originally a woman who was greatly addicted to smoking, and who met with her death by drowning in a lake. A peasant, whose horse was grazing near that lake, imprudently called out, "Fika, won't you smoke a pipe?" No reply was made; but when he mounted what he thought was his horse, it grew and grew until it became a huge monster which carried him off. In this instance, at least, the Fika seems to be akin to the Irish Phooka. The Gibane, who pays visits to cottages in which cakes are being baked, is another female demon peculiar to the Wends; and so is the Wurlarwa, who torments women whom she finds spinning after ten o'clock at night. In most lands traces are found of an old belief that certain demons object to work being carried on at noontide; but in those which are inhabited by Slavs such a belief is exceptionally vigorous. Thus among the Wends a mysterious female

* *Wendische Sagen, Märchen, und Abergläubische Gebräuche.* Gesammelt und nacherzählt von Edm. Veckenstedt. Graz: Leuschner & Lubensky. 1880.

being, called the Pšezpolnica, is supposed to watch over the cornfields at midday to punish the reapers who continue working after twelve o'clock has arrived, and to shear off, with a golden sickle, the heads of thieves who take advantage of the absence of the harvesters. She is clothed in a long white dress, and she carries a bag, into which she drops the heads of offenders, among whom are reckoned children who tread down the corn. At one o'clock she always disappears from sight. On one occasion a mason, to whom she paid a visit at midday and propounded conundrums, nailed her finger to the wall of the house which he was repairing, and fled. When the people of the house resumed their work in the afternoon, they found to their surprise a finger attached to the wall by a nail. In some localities the Pšezpolnica is supposed to render the cornfields dangerous from two to three in the afternoon, during which time, also, her sister, the Dziewica, haunts the dark fir woods, followed by splendid deerhounds. Closely akin to these sisters are the Serpolnica and Serpysyja, who wander about at midday and midnight, always provided with a sickle, but sometimes destitute of a head. In 1813 four French soldiers, who had gone out foraging from Drebkau, discovered a hidden treasure, and were just about to carry it off, when a female form appeared before them clad in white, and threatening them with a sickle. Whereupon they took to flight. Under the names of Anna Subata and Maria na Penku, other female beings of an equally unpleasant nature are familiar to the Wendish mind, which believes also in the existence of similar male demons known as the Serp, the Serpel, and the Posserpanc.

Under the name of the Bludnik, a luminous demon corresponding to our own Will-o'-the-Wisp is supposed by the Wends to delight in leading belated travellers away from the right path and into thickets and swamps. In the time of the Seven Years' War several Bludniks haunted a hollow willow tree, from which their light used to stream forth at night. Two boys determined to burn them out of their home. They were told that the Bludniks were the souls of dead children, and ought not to be disturbed; but, in spite of the warning, they set fire to the tree, and then ran away. But before they reached their home, an unseen hand knocked them into a neighbouring pond. The old people who heard what they had done predicted that they would die soon. And before the year was out the two boys were in their graves. Closely akin to our own nightmare is the Wendish Murawa, a being which, like the Russian Mara, grievously plagues sleepers. Sometimes it takes the form of a frog or of a snake, and it is often a shape into which a malicious witch has transformed herself. Thus a girl who could change herself into a Murawa took it into her head one day to torment a shepherd whom she saw afield. "Her body immediately fell lifeless to the ground; out of her mouth sprang a mouse which ran to the shepherd and threw him down." He lay prostrate and groaning, while the mouse ran to and fro over his body. When it had plagued him enough, "the mouse ran to the girl's body, and slipped back into her mouth. The girl immediately became alive, stood up, and went on working as before." Sometimes the Murawa takes the form of a moth, and creeps down the throat of any sleeper whom she finds with his mouth open. The best means of keeping her at a distance is to nail up the oldest article of clothing of which the inhabitant of the bedroom is possessed.

A still more terrible female visitant than the Murawa is the Plague, of whose ominous wanderings and fatal visits the Wends have many tales to tell. As in the stories of other lands, she is generally described as a tall, gaunt woman, who sits by the wayside and tries to induce passers-by to convey her to their homes. If they consent, they find too late that they have introduced pestilence into their households. But one of the accounts differs from the rest, being really a vampire story combined with a pestilence tradition. A daughter, as black as ebony, was born to a Queen who had declared one day, while sitting on a black stone, that she would be happy if she could have a child, whatsoever its nature might be. The black Princess died when she was twelve years old, and her coffin was placed with the lid open in a church before the altar, and a soldier was sent to guard it at night. In the morning he was not to be found. Night after night the same disappearance of the sentry took place. At last the soldier on duty bethought himself of creeping under the coffin. When the clock struck twelve, the dead Princess sat up in her coffin, looked round for some one to devour, and exclaimed, "Has my father sent me no victim to-night?" After a time she guessed where the soldier was, and cried, "What is behind me I do not seize. Knowest thou who I am? I am the Plague." Then she disappeared, uttering curses against mankind. Of vampires, properly so called, not many stories are told. But there is one which is very precise in its details. In the neighbourhood of Kiekebusch a peasant was found dead, evidently murdered, and was buried. After a time it was rumoured that the dead man was in the habit of visiting houses at night and sucking the blood of any one on whom he could lay hands. So the villagers dug up his body, and drove a consecrated nail into his head, and a stake into his heart. But even then he would not keep quiet. So they dug him up again, and this time consumed his body with fire, scattering his ashes to the four winds. After which the villagers were able to sleep in peace. About ordinary dead people a few stories of the usual kind are told. One of them contains a sound moral strongly inculcating filial respect. A certain peasant was a bad son, constantly behaving ill to his aged father. At length the old man died. Towards midnight the son went to bed. Before he had time to go to sleep he received a tremendous box on the ear. From that time forward, as each year brought round the anniversary of his father's death, at the midnight hour "his father's ghost appeared and hit him a blow on the head." It appears also that the ghosts of hanged persons repay by boxes on the ear the trouble which people may have taken to cut down their bodies. In Schorbus church, those of the dead whose shrouds are ample sit comfortably in their pews during the ghostly service on Christmas Eve. But those whose relations have supplied them but scantily with graveclothes are obliged to lean their backs against the wall, in order that their partial nakedness may not be seen. There once lived in Missen a pious maiden. Three nights running there came to her bedside a figure which uttered no sound, but sadly gazed at her, and then beckoned to her to follow. On the third night she rose and followed it. It led her into a church, before the altar of which stood a coffin fastened with a golden padlock. The figure gave her a golden key, and intimated by signs that she was to open the coffin. She did so, and the coffin lid flew open, revealing a body lying within. Then all disappeared, and the girl found herself alone, holding in her hand the golden padlock and key, which she afterwards was in the habit of exhibiting to her friends.

On the history and ethnography of the Wends not much light is thrown by their traditions, but here and there references to old times occur which are curious. According to one legend, "the King of the Wends came with his people from the borders of Asia, and after long wanderings settled down with them in Lusatia." Another tells us how "the Wends came from Asia, led by a king. In crossing a great mountain range on their way, two-thirds of their number were destroyed by the hostile mountaineers." The men wrapped themselves in huge furs and rolled down the slopes. The women were let down by ropes. After this fashion they reached Silesia, whence they were driven out by the Germans. In Lusatia their kings long reigned, but when the Hohenzollern family came into the land, and built a fortress at Berlin, the power of the Wends dwindled, and at length came to an end. There will be, however, a final conflict, during which the dead Wends now sleeping within the Plonitzka and Raditzka mountains will come forth and drive the Germans across the Rhine. Around the shadowy form of the King of the Wends a number of myths have clustered, some of them associating him with the "Night-hunter," the Wild Huntsman known to so many races of men, sometimes with the Arthur or Barbarossa who sleeps amidst his slumbering warriors within some mountain cavern. It seems that "the time is not far off when a world-wide conflict will commence. When war has begun, and the nations are struggling with each other, the King of the Wends will return, and will conquer the Germans, and afterwards will found a realm which will comprise all the nations of the whole earth."

According to some traditions, the Wends are descended from the Ludki, who were small men, not longer than a finger, and who seem to be in many points akin to our own fairies. If other stories can be trusted, the Wends must also have been singularly like our own men of Gotham. But such tales as these are probably of German origin. Of Wendish folk-tales Dr. Veckenstedt gives thirty good specimens, very useful for the purpose of comparison. They are almost all variants of well-known popular fictions; but there is one ghost story which is so originally irrational that it is worthy of being cited. Two boys, whose mother was dead, were awakened from their slumber one night by a white female figure, which came up to their bedside and then disappeared. Next night she came again. "Why dost thou disturb my sleep every night?" asked the elder boy. "Thy words will bring thee harm," she replied. Next morning the boy was found dead in his bed. On the following night the figure reappeared, clothed in black. "Dear lady, tell me what is thy desire," said the surviving boy. Whereupon the apparition gave him a black glove, and told him to take it next morning to the garden, and walk about with it till it turned white—then to halt and dig. He followed her instructions and dug up a copper pot. "Inside it was a skull, which was quite full of gold."

BUCKNILL ON LUNACY LAW.*

THERE is no greater authority on lunacy than Dr. Bucknill. He has all the right to speak about it which can be conferred by general medical eminence and special acquaintance with brain disease. In the *Care of the Insane and their Legal Control* we have his mature and deliberate opinion on the existing system of dealing with lunatics, and this opinion is in almost every respect adverse. The existing system is in the main a system of asylums, public or private, and, as regards a large number of patients, Dr. Bucknill altogether objects to asylums. The most original feature of his book is the change of form which the ordinary indictment against the keepers of private asylums undergoes in it. It cannot, Dr. Bucknill says, "be too much insisted upon that the allegation against the proprietors of private asylums is not that of *mala fides* in taking, detaining, and confining persons of unsound mind as lunatics; but that they detain persons of unsound mind whose confinement within their walls is unnecessary and unlawful." The only ground for the detention of a lunatic in an asylum which is known to the common law is that he is dangerous to himself or to others. It is not enough that he is subject to delusions, or apt to spend his money foolishly, or spiteful and watchful of opportunities for inflicting petty annoyances on those with whom he lives. These inconvenient or unpleasant qualities

* *The Care of the Insane and their Legal Control.* By John Charles Bucknill, M.D., F.R.S. London: Macmillan. 1880.

do not make him a dangerous lunatic, and by the common law it is only a dangerous lunatic—that is, a lunatic of suicidal or homicidal tendencies—that may be "restrained of his liberty by another." In Dr. Bucknill's judgment it would have been well if the statute law had never departed from these lines. A dangerous lunatic—the maniac or madman of the last century—was a being about whose condition there could be no mistake. When the madhouse passed into the "licensed house for the reception of insane patients," this safeguard disappeared, and free room was given to all those ingenious speculations of mad doctors which promise to end, if they have not indeed ended already, in the discovery that all of us—these doctors excepted—are mad upon some point or other, and owe our continued, though precarious, liberty either to chance or to the weak kindness of some relative as mad as ourselves. Indeed, considering the extraordinary facilities which the statute law gives for the capture of certified lunatics, it is wonderful that the asylums are not more numerous and more crowded than they are. The only assured protection is destitution. A pauper lunatic is pretty sure neither to be placed in confinement nor kept in it without good cause. The fact that he has to be maintained out of the rates ensures that those with whom the decision lies will not be too easy in admitting proofs of lunacy. Dr. Bucknill insists with great justice upon the absurdity of a distinction which makes it comparatively easy to lock up a rich lunatic and difficult to lock up a destitute lunatic. There may be a dozen people interested in placing a man with property in a position in which he will be alike unable to manage his own affairs and to check their administration of them. There is no one interested in placing a man who has no affairs to administer, or to have administered, in a position where he must be lodged, fed, and tended at the public cost. Yet the lunacy laws surround the latter process with safeguards which are altogether wanting in the former process. A destitute lunatic cannot "be confined in a public institution, under the charge of public officials, and maintained there out of public funds, except upon the intervention of an officer who administers these funds, and the order of a magistrate." A lunatic with money may be locked up in a private place of confinement upon the order of any person—an alien, an infant, or a man of straw—with whom the owner of the place chooses to make a pecuniary agreement. If the framers of the existing lunacy laws had wished to create abuses, instead of guarding against them, they need only have gone to work in the way they have done. The motives for sending patients to asylums need not rise to the level of heroic wickedness. There are many persons who are sent there, not because their relations wish to rob them, but simply because their relations find the care of them inconvenient. The fact that the comfort of the sane is destroyed by the presence of an insane person among them may be a proper reason for subjecting even a harmless lunatic to some kind of restraint; it may even be a reason for sending a harmless lunatic to an asylum. But neither course ought to be adopted without full consideration of the circumstances by some disinterested official, or without proper regard for the comfort and general welfare of the person so dealt with. As the law stands, neither of these conditions is complied with. The medical certificate is everything, and the medical certificate may very easily certify to nothing at all. It must be signed by two medical men, but these medical men may be any physicians, surgeons, or apothecaries in actual practice; they are expressly released from the check of a consultation; and they are only required to certify that the person it is proposed to consign to a lunatic asylum is of unsound mind. When the certificate has been given and the order founded upon it signed, the statute confers upon the owner or superintendent of any licensed asylum a power to which there is no parallel in English law. For seven days afterwards, he or his servants may search for and seize the lunatic, and convey him, under such restraint as may be necessary, to a private prison. There is no one to whom the lunatic, so called in the certificate, can appeal for protection; and the owner of the asylum is entitled to plead the order as a justification against any civil action for false imprisonment. This extraordinary provision was enacted in 1845, and has probably done more than anything else to foster the abuses which now so urgently call for redress.

Dr. Bucknill proposes to amend this system in every particular. In the first place, he would have the examination of the patient made by the two medical men in consultation, so that their opinions might check one another. In the second place, he would provide that the certificate should specify the nature of the mental complaint, at all events so far as to say whether it is lunacy, idiocy, or unsoundness of mind; in other words, whether it is due to disease, defect, or decay. In the next place, the medical men should be made to indicate the kind of treatment they hold the case to require, distinguishing at the least "between care and treatment in domestic life and care and treatment in an asylum." At present "a medical man who has given a well-intentioned certificate, under the belief that it would be used as a justification for gentle control under the former, is liable to find it utilized for imprisonment in an institution." Further, Dr. Bucknill would have the medical men state the reasons which induce them to recommend one or the other course, and name the persons to whose care they would advise that the patient should be committed. It is plainly a very much easier matter to enumerate certain facts which point to the conclusion that a patient is of unsound mind than to show how the facts stated bear out the conclusion that the patient is a lunatic, not merely a person of weak or decayed intellect, and requires to be treated in an asylum rather than simply placed under domestic supervision. Still even these precautions will not be adequate unless the power of ordering the confinement of a lunatic be taken away from private persons and be entrusted, as every other similar power is entrusted, to a public official. Dr. Bucknill would have no lunatic sent to an asylum except by a magistrate's order; the medical certificate being the evidence upon which the magistrate would act and as to the veracity and sufficiency of which he would form his own opinion. The argument urged against this provision will of course be the one which is the main foundation of the private asylum system. It is alleged that, in the interest of the patient and of his family, secrecy is of paramount importance, and that a magistrate's intervention will be destructive of secrecy. It may be doubted whether, from the point of view of public policy, the advantages of secrecy have not been exaggerated; but, allowing them to be as great as they are assumed to be, they ought not to be purchased at the cost of grievous wrong-doing. Any system which puts the power of imprisonment into private hands makes such wrong-doing possible. No doubt both the lunatic himself—supposing him to recover—and the lunatic's family in any case, may be justly anxious to conceal his misfortune from the world. But then the machinery employed for this purpose must not be such as can be perverted without difficulty to the unjust arrest and imprisonment of men whom no public authority would dream of ordering into confinement. The nearest relations are not invariably the right persons to decide whether a man shall be placed under slight supervision or sent to an asylum. If they are not the right persons they are probably the very opposite of the right persons. If they are not restrained by kindness or affection from consigning their relative to a prison, they are likely to be prompted by personal interest to send him there.

The reforms which have been enumerated are only suggested by Dr. Bucknill as palliatives. If the system of private asylums is maintained, it ought to be maintained under safeguards which would considerably lessen the number of persons now under treatment in them, and make future admissions very much more difficult. Dr. Bucknill, however, would go much further than this. He would begin by reducing the existing authorities on lunacy to two—the Court of Chancery, in whom should vest the custody of all lunatics possessed of any property or maintained by their relatives, and the Local Government Board, in whom should vest the custody of destitute lunatics. The Chancery lunatics should be placed partly under domestic supervision, partly in asylums provided by, though not at the cost of, the State, and partly in such private asylums as could succeed in inducing patients to come to them of their own accord. In this way no one would be imprisoned beyond the power of escape, except in public institutions. The supervision now exercised over Chancery lunatics under domestic supervision would be sufficient, Dr. Bucknill thinks, to secure the proper treatment of such lunatics as are neither dangerous nor in need of the restraints which can only be provided in asylums. Those who preferred a gregarious life might find it in asylums intended for the reception of voluntary patients. Those whom it is necessary to place in confinement would be given the full protection of the State, in the shape not merely of supervision exercised over the interested persons placing or detaining them in confinement, but of absolutely disinterested officials. This would have the further advantage of removing the obstacles which are now occasionally met with in confining persons about whose madness there is no doubt whatever. Respectable doctors like to err, if they must err, on the safe side, and they will not always give on their own sole responsibility the certificate which they would willingly give if it was only to form material on which a magistrate might base his decision. It is amazing that the lunacy laws should have been suffered to go unamended so long. When the new Government redeems the pledge of its predecessor and takes this crying abuse in hand, it is to be hoped that no one will be found opposing a radical reform of the existing system who has not studied and found an answer to Dr. Bucknill's trenchant attack on it.

OLIVER CONSTABLE, MILLER AND BAKER.*

It is difficult to fix on the class for whose service or amusement this story has been written. It is intensely didactic in tone; every scene has evidently a purpose beyond the ordinary aim of the novel; but for whose use so much teaching is designed is a matter as to which the reader remains in ignorance to the end. It seems alike unsuited for those who know something of the world to which it introduces us, and for those who do not—for those who would be social reformers, and for those whom they would reform. Great questions are discussed, knotty social difficulties are handled, confidently enough, but something in the writer's tone and method leaves this preliminary difficulty unsolved. If the book is designed for the class which the hero sets himself to benefit, we can only say that the picture drawn of their present low level of thought and manners is too insulting to serve any good end. If it is intended for the class above them, the lesson is scarcely clear and definite enough to settle any of the difficulties inherent in class distinctions. The most probable readers, we incline to think, are not those who will care for the author's lessons, but those who may find amusement in being told, with so much detail, how the sons and daughters of shopkeepers conduct themselves in the home circle, and with how little attention to the *convenances* they carry on their flirtations.

* *Oliver Constable, Miller and Baker.* By Sarah Tytler. London: Smith, Elder, & Co.

For the task of reporting feelings and opinions in a dialect alien to the habits of the reporter a very particular sympathy is required. It is necessary to put the mind in close relation with the person to be represented; and at the same time to translate the language one would naturally use into an unfamiliar form, such as is supposed to be the vehicle of expression of the mind delineated. Miss Tytler has plunged into this difficulty with so little sense of the task before her that she would seem to assume that all vulgarity, young and old, male and female, has but one vocabulary, and that one form of slang meets the requirements of every untrained mind. We should not make a point of this, however, if the author's shopkeepers were merely individual examples; but she takes pains to impress upon the reader that they are typical. Her hero "is compelled to suspect that" her "Dadds and Polleys presented an average specimen of their class." No sensible shopkeeper will object to be called an *épicier*, or to share with the mass of his countrymen the charge of Philistinism. In either language the reproach implies an ultra-respectability; but when we come to the wives and daughters of grocers in *Oliver Constable*, it is altogether another matter. Let us listen to Mrs. Polley, presiding at her table in the back-shop, and addressing her husband, who has ventured to compliment her cookery:—"You shut up, Polley, and eat your victuals. For you know you have a trick of keeping the table waiting. I am glad none of the gals take after you. Slow at meat is slow at work. You may be thankful I never were a dawdler, and that I went in —the greater fool I—for looking after you." Or take Mily Polley, the heroine of the shopkeepers' annual picnic, who represents the girl of the period in that class; this young lady announces that Jack Dadd has got his father to fork out two bottles of sherry and two of champagne, a wine she adores—"the real, not the gooseberry thing." "I should like to swig it like beer—that's me. But shan't we have a guzzle." And when Oliver, the reformer, whom she pronounces a handsome gorilla of a duffer, proposes to mix claret-cup, she replies, "Thank you for nothing. Nasty flat trash! I'm for as much champagne as I can get for my share, without mother's interfering. There!" Mily, we are told, called a spade a spade. Oliver, in his line, lightens his heavy part by recourse to conventional modes of expression. Himself and his friends are "beggars" and "duffers," epithets which ill suit a vein of solemn moralizing.

Such being the present mental and moral condition of the shop-keeping class, the author suggests a means of rescue from this slough of lowness; one of its own members is to leap into its very midst, and so to save it. Oliver Constable is the son of a miller and baker. He is sent to Friarton Grammar School, where his progress and his turn for scholarship win the favour of "the learned masters and parsons," who persuade his father to send him to Oxford. There he at once gains a scholarship, and finally a first class, to the great delight of his sister Fan, who is ambitious, and would gladly escape from the associations of Friarton and the society of her class. Her education has been as much above her position as her brother's, as she has been sent to excellent schools, both in England and abroad. The good old father dies, and Oliver's course is free; when, to poor Fan's astonishment and disgust, he announces his unalterable determination to carry on his father's business of miller and baker, with all the conditions of shop and shop-window full of tarts and confectionery. Class with Oliver is as rigorous a master as caste. He resolves to devote himself to trade, to making the honestest bread that can be made, and to reforming the principles and manners of the Dadds, the Polleys, and their fellows. Bent on this mission, and entirely unsympathetic—as is also the author—towards poor Fan, he enters upon the conduct of a business which we had supposed to need an apprenticeship; and, in a quarrel with a contumacious journeyman baker who objects to his rules, kneads with his own hands a batch of bread. Fiercely rejecting all the practices of the trade, he not only quarrels with his men but loses his customers, who do not like the colour of his honest loaves. The author has apparently got up the baking business with some care; at least she spends a great many pages upon it, though we are not told how Oliver's special batch turned out; and no minuteness of detail enables the reader to reconcile the training of the master baker with his craft. The author could not have carried out the plan of her story if she had been better informed on any of the questions involved in it. Everything is viewed from a lofty distance apart from experience—the position which of all others sustains the observer in a serene conviction of being in the right. Whether it be the relations of Church and Dissent in the classes she depicts, social intercourse, trade customs, domestic habits, æsthetic tastes, Parliamentary conscience, or the art of electioneering, every thing and person is discussed in that vein of censure tempered by patronage which belongs to a superficial acquaintance, to an outside survey with no real contact. The subject which seems to lie at the bottom of all these great controversies is that especially feminine question, class distinctions. No doubt circles, grades, sets, and so on, are matters left very much to the ordering and regulation of women. Who has a right to visit whom, who is impertinently ambitious in the endeavour to intrude into a higher social sphere, the respective claims of birth, rank, fortune, and personal merit—these nice points exercise the female mind, and, on the whole, to the general advantage. The drawing-room is the woman's kingdom; but its code of laws cannot be reduced to writing. No ready-made rules can settle the infinite variety of conditions. It is a region of talk and action, a conflict in which merit, chance, interest, and fortune settle things. The author represents all the personages of her story, men as well as women, as engaged in this great question. When the clerical usher's wife makes her purchases at Mr. Dadd's counter, gracious as she is, she conveys to his mind her intense consciousness of superior social advantages, and manages to impress on him that his "better half was of a different order of creation from that which had the honour of claiming Mr. Freemantle as its product." And her husband, in the great matter of Oliver's downward step, both indulges and excites the same order of feelings. "He might be as poor as a church mouse," reflects Mr. Dadd, "but he could read the lessons in his white surplice the same as the Archbishop of Canterbury. Dadd went in for chapel, not church; but even his minister owned that Freemantle was a cut above him in this world." And Oliver, who had been seen with his arm linked in that of Mr. Freemantle, renounced this inestimable social distinction in taking up his father's calling. Every other consideration gives way to this mode of arriving at the essential fitness of things. While Oliver was under the glamour of his Oxford life and associating with gentlemen, we are to assume that, as far as action went, he was a Churchman; but in taking up his father's trade and humble social status, he goes to chapel with his fellow retail traders, and patronizes the minister. His sister Fan, on the contrary, mindful of their mother having been a curate's daughter, clings firmly to the gentility of the Establishment.

As the hero, in his devotion to his class, throws over his Greek and Latin to sell bread and confectionery, so there is a foil to this sacrifice in the wilful descent of a scion of the aristocracy to the rank of yeoman. Instead of going to Australia, Harry Stanhope and his brother take a farm in the neighbourhood of Oliver's mill, and decide to throw over all the prejudices of their birth and training. Fan can sympathize with a yeoman who is grandson of an earl; and finally, to Oliver's extreme disgust, she marries Harry. She is an energetic and devoted wife; but the downward course is too headlong for her influence to check it—her husband takes to drinking. She dies worn out with anxieties, and her death converts him. Perhaps it is not out of nature that such a convert should take to preaching, and make his own past life his theme. To do the author justice, she betrays a consciousness of the danger, while attempting to depict a hero, of portraying a prig. She invests Oliver with awkward lounging personal habits, and finally lames him for life from the effects of a personal contact with his journeyman. But a person who enters into society solely with a view to improve it, without a thought of reciprocal advantage, cannot be anything else than a prig. Congenial social intercourse is not only the solace, the relaxation, the enjoyment of man, but it keeps him humble and in his place. He is more conscious of getting good than of imparting it. But if he starts in his social career by regarding society solely in a missionary spirit, solely as a thing to which he can do good, for which he is to make sacrifices of tastes, likings, and habits, upon which he is to practise his hobbies, to which he is to dictate, preach, and lecture—without any thought of being done good to, amused, informed, interested, benefited, or dictated to in his turn—human nature is not equal to the strain upon its inherent pride and self-love. His gait, his voice, his action, the whole outer man, will betray the effects upon the inner man of the *rôle* he has set himself; and these effects are patent in Oliver Constable. Of course it is open to an author to bring about any results that his theory demands, and the story closes with a general reform and recognition of Oliver's merits; and, whether likely or not, it is pleasanter to see the Dadds and Polleys subdued and contrite than exulting in their excesses, whether of language, manners, or opinions. Some of our readers may remember a novel by the same author, and dealing with the same question of class distinctions, *Noblesse Oblige*. As far as we recall it, the treatment of this question in relation to a higher social rank suited the writer's powers, and no doubt her knowledge and experience, far better than this descent into a lower sphere, where she has been driven to exaggeration and caricature for lack of the nicer touches that real acquaintance and intercourse would suggest.

MINISTERIAL RESPONSIBILITY IN IRELAND.

THE LORD LIEUTENANT of IRELAND lately told the deputation of landowners, with literal truth, that the power and duty of repressing lawlessness rested with the Cabinet, and not with himself. No one will suspect Lord COWPER of sympathy or tolerance for revolution and murder; and he may probably have exhausted all the means at his immediate disposal for palliating the evil. By an odd conflict between ancient forms and existing conditions of government, the Secretary to the Lord Lieutenant, when he is a member of the Cabinet, possesses higher authority and greater responsibility than his chief. It can scarcely be doubted that on the earnest demand of Mr. FORSTER the Government would assemble Parliament to demand the extraordinary powers which were surrendered for the sake of popularity. The Lord Lieutenant has nevertheless the power of applying pressure both to his nominal subordinate, the actual Irish Minister, and to the Cabinet. Lord COWPER might decline to retain his office unless he were armed with the necessary authority; and Mr. GLADSTONE himself would perhaps hesitate to widen the breach between his Government and the loyal remnant of the Whig aristocracy which in doubt and alarm clings desperately to its old party connexion. The LORD LIEUTENANT seems to have received the deputation with proper courtesy, and his subsequent visit to England may perhaps have been caused by a desire to enforce their representations. As might be expected, the demagogues have sneered at the privacy for which their possible victims stipulated, and have contrasted the precautions which were taken against imminent risks with their own notorious immunity from the punishment due to their crimes. Other orators have pretended to apprehend violence from the handful of landlords who still cling to the vain hope of security for life and property. The inquiry of one of the deputation whether the Government would protect them or they should protect themselves is fraudulently denounced as a threat of civil war. It is true that an armed struggle, which might possibly end in the defeat of the revolutionary faction, is inevitable if Ireland is to be governed according to two irreconcilable Irish ideas; but England has not yet renounced the indisputable duty of keeping the peace.

It is not surprising that, under the impunity hitherto enjoyed, the declamations of the agitators should have constantly become more extravagant. The same insolent brawler who expressed his desire for the assassination of the QUEEN by some Irish HARTMANN was lately welcomed at the meeting of the Land League under the merited title of Mr. PARNELL's first lieutenant. He proved his right to the title by the most direct instigation to murder on which any of his gang have hitherto ventured. If, he said, any violence were offered to a landlord or agent, the League would take care that any person accused should be furnished with the means of defence, especially as he might perhaps be innocent. Mr. DILLON and others have lately been shamed into an affected disapproval of murder and cattle-maiming by the protest of Archbishop M'CABE against their incitements to outrage. Mr. DILLON declared that he had more than once professed to differ from his hearers when they interrupted him with cries of "Shoot the landlords," and one or more of his fit associates gravely confirmed his statement. The ARCHBISHOP is apparently well-meaning; but he is either unwilling or afraid to acknowledge the legal right to property. As a set-off against his sincere and earnest reprobation of violence, he thinks it necessary to condemn the Land Laws, which must in substance be maintained unless an agrarian revolution is to be accomplished. It is notorious that the greater part of Ireland is prosperous, and that the population would be contented but for the seditious agitation of the Land League. It is but a questionable service to the cause of law and order to justify the ends which the demagogues pursue, and only to condemn the means which they select for accomplishing their purpose. Mr. PARNELL and his allies may justly reply that they understand their business better than the respectable prelate who only goes with them half way. Even the brutality of their language is calculated, and it is not ineffective. Indignation becomes fainter as the defiance of principle and custom is familiarized by repetition; and the agrarian code, which has for generations been elaborated by rural conspirators, acquires additional authority when it is with impunity promulgated in public.

The Irish Government went perhaps to the utmost extent of its present powers, short of the prosecutions which seem about to be undertaken, in increasing the Constabulary force in Galway and Mayo at the expense of the local ratepayers. The measure is just and necessary, but it is absurdly disproportioned to the emergency which it is designed to meet. The police has hitherto had no open insurrection to suppress, and unless it were ubiquitous, it cannot prevent isolated outrages. Two or three alterations in the law are urgently needed, in addition to other restrictions on extravagant license. The population ought to be disarmed, or at least to be debarred from the existing facility of procuring deadly weapons. A Minister who, if he were legally entitled to interfere, would permit a single rifle or revolver to be sold to a peasant would deserve impeachment. A Minister who deliberately declines to obtain a power which it would be criminal not to exercise, incurs, to say the least, a grave responsibility. No part of it can be devolved on the partisans who daily applaud the Government for keeping within the limits of the Constitution. One of the primary elements of constitutional liberty is the suspension of any rule or practice which interferes with the primary object of protecting peaceable subjects. Another measure which ought to be adopted is the suspension of the Habeas Corpus Act at the discretion of the Executive Government under certain restrictions. The authors or projectors of agrarian outrages are often well known to the police, though, through terror and sympathy, those who could give evidence of criminal acts and designs refuse to aid the operation of justice. Constitutional liberty, like freedom of discussion in Parliament, is only possible under the condition that the community is generally loyal and well affected to the law. When the PARNELLS and BIGGARS deliberately obstruct debate, extraordinary measures are found necessary to meet an unforeseen difficulty. When the disciples of the PARNELLS and BIGGARS conspire to withhold rent and to murder landlords, they must submit to a control which would be less mildly exercised by any other civilized Government. Perhaps the most indispensable of all measures is the suspension of seditious public meetings. The circulation of incentives to private vice is prohibited and punished; the intentional promotion of anarchy, robbery, and murder is systematically encouraged by toleration. The impotence or unintended complicity which thus far has been displayed

by the Government was made the more conspicuous by the official knowledge which has been from day to day procured of seditious and criminal harangues. The Government reporters, though they have in a few instances been threatened or molested, are for the most part with judicious contempt allowed to execute their duties. The demagogues have too long enjoyed the satisfaction, not only of defying the law, but of believing that the Government dared not prosecute. Even now, if juries can be trusted to give honest verdicts, the punishment of the criminals will not undo the evil which they have caused. What is wanted is not half-a-dozen sentences of fine and imprisonment, but the prevention of seditious orations. A country without Land League meetings and without firearms in the hands of rebels and assassins might perhaps be deemed happier than a country in which no respectable man is safe from robbery and from murder.

The Government has at length, it may be hoped, discovered the uselessness of trying to disarm the agitation by large concessions to tenants at the expense of landlords. Mr. PARNELL has of late guarded himself against the risk of conciliation and compromise by repeatedly declaring that he will accept nothing short of his full demands, and that nothing is to be hoped from the present Ministry. When the Ministerial Land Bill is produced in February next, he will have the opportunity of reconsidering his decision. Mr. GLADSTONE and Mr. FORSTER probably hope that he will condescend to a prudent inconsistency, and that the Irish members will give them an irresistible majority. One of the minor conditions of the anticipated alliance is that a certain number of landlords will have been shot during the winter, and that there will be a general suspension of rents. The Liberal party is not to be intimidated by dangers and sufferings affecting for the most part their political opponents. It is not improbable that the supposed calculations of the Ministers will be justified by the event. Mr. PARNELL, who now refuses to be satisfied with any possible concession, not long since professed to fear that the Disturbance Bill, though a petty and temporary measure, would disarm the agitation. He will perhaps not refuse a larger concession from the weaker party to the dominant faction, especially as he will retain the power of renewing the agitation until he has expropriated the landlords without compensation. The present movement could not have been more formidable if the Land Act of 1870 had never been passed. If the landowners of Ireland are mulcted by legislation to the extent of one-half of their property, it will be thought worth while to intimidate or murder the survivors for the purpose of obtaining the rest. It is highly questionable whether any new Land Act can be at the same time just and expedient. There can be no question of the duty incumbent on the Ministers of protecting life and property.

FRANCE.

NOWHERE has the sudden change in the attitude of Turkey been more heartily welcomed than in France. It is accepted as a sign, not only that France may hope to keep out of a war and see its neighbours equally fortunate, but that it may steer clear for the present of anything like a scrape or embarrassment abroad. There has passed over a considerable portion of French society in the last few weeks what may be described as an epidemic of nervous timidity. That France should, under any circumstances, do anything anywhere has seemed to be the most terrible of suggestions. There is no reason to doubt that this feeling of nervousness has been genuine and general. But a very slight examination of different specimens of the French press suffices to suggest that the desire of the people for external peace is being used as a vantage ground from which the adversaries of the Government may conveniently attack it on those domestic questions which interest the different sets of French politicians much more powerfully than the fortunes of Montenegro and Greece. It is strange to find Bonapartist organs writing on the blessings of peace as if the writers had been Quakers from their cradles. The question of inaction abroad has really passed into the question of reaction at home. The adversaries of the Government wish the Government to do nothing; to propose nothing, to undertake nothing. If the Ministry can be persuaded that it has only to own itself entirely impotent in order to satisfy the country, then the Opposition will have the pleasure of really ruling; it will have told the Government what not to do, and will have the credit of its sagacity and influence. But here, again, the notion that the country longs for complete repose even in home matters is not a mere invention of Opposition journalists. There is apparently a conviction among many sincere Republicans that a season of legislative idleness would fall in with the present temper of the electors. The precise form which this view of things assumes is to suggest that, as the present Chamber has now only one more year of existence, it ought not in decency to pretend to the activity of youth. It is old and decrepit, and ought to behave as well-conducted persons of advanced age are accustomed to behave. It ought to sit in the sun, take snuff, and fold its hands. This attitude of mild despair is combated by M. GAMBETTA with all his usual energy. He has found out that, if the age of the present French Chamber is estimated rightly by its corresponding period in human life, the Chamber is now exactly fifty-five, and that is a time of life when men retain all their energy and can profit by all their experience. Far from shirking work, he therefore thinks the Chamber ought to labour more strenuously and resolutely than ever. He thinks it will be eternally disgraced unless it does some great things before it expires, and the tasks he sets it are to reform the Judicature, and to institute gratuitous, obligatory, and secular primary education. Those who follow in his steps, but follow with some degree of reserve and caution, think the reform of the Judicature is rather too big a job for the poor old Chamber; but that, if kept well up to its work, it might be taken through a good law of primary education, and a good law to permit and regulate public meetings. But they quite agree that it would be disgraceful if a year were thrown away, and nothing Republican were to come in the next twelve months from a Republican Ministry and a Republican Chamber. The contest, therefore, that is now going on in France is not so much a contest as to minor questions, such as the naval demonstration or the treatment of the Congregations, but as to the proper attitude of the Government and of the Republican leaders to the country on all questions, foreign or domestic.

There can be no doubt as to the answer which the chiefs of the present Cabinet and of the Republican party in the Chamber will give. They are all for activity. They may be stopped by what they learn of the attitude of the country; but they will not be easily stopped. They have a creed which they will not lightly abandon, and the main article of this creed is that it is their mission to push France forward. They have got a democracy, and what they want to get is an enlightened democracy. Naturally what they mean by enlightenment is enlightenment after their own pattern; but still it may be said for them that their great purpose is to quicken the mind and to raise the social condition of France. Whatever we may think of this purpose, it is a complete mistake to judge of those who entertain it solely by their management of the great matters which not only come before the Chamber, but mainly attract the attention of Parisians and foreigners. The Republican leaders are always at work in little things as well as big. Something is always being done which in itself seems too trifling to be noticed, but which is nevertheless a sign of the general direction of a great movement. Any week would furnish numerous instances, and the last few days may be taken as only providing an adequate illustration. M. JULES FERRY, as the Minister of Public Instruction, has just issued a circular on the choice of classical books in secondary schools. He takes the trouble to discuss whether a list of the books to be taught should be forced on the teachers by the central authority, or whether the teachers should have a voice in the selection; and he decides in favour of the latter system. He wants to make education more lively by making the teachers more alive. They are to meet together to compare notes, to make and receive suggestions, and then to prepare their list. In a country so centralized as France it is needless to say that their list is to be subject to revision. It is, in fact, to be revised first by a Commission of the department, and then by the Rector. The suggestions of the teachers will have to be very carefully sifted before they are formally made, if they are to be finally adopted. But the notion that the minds of

the teachers are to be stimulated as well as the minds of the taught is so new in France that the first impulse of many critics of the circular has been to reject the proposal as absurd. Then, again, a very serious effort has lately been made to extend the sphere and the usefulness of public libraries in Paris, and a report has just been issued which shows that the effort has been already rewarded with very considerable success. The number of readers in 1879 was double that in 1878, and the number in the first half of 1880 was as great as that in the whole of the previous year. It is in accordance with French rather than English ideas that it is even proposed, as a great improvement, to have a special staff in these libraries which will advise what books should be read by those who have no choice of their own, and should show those who have any special taste what are the best books they can consult. Lastly, the difficult question of the proper treatment of juvenile offenders has cropped up in France as it has lately cropped up in England. M. GAMBETTA has taken under his wing, although without committing himself definitely to adopting it, a proposal made by the Director of the Assistance Publique. This proposal only deals with vagabond children under the age of sixteen who have been taken up by the police, and of whom there were in 1878 rather more than 2,000. It is suggested that these children might be sent wholesale into the provinces and there apprenticed, and that payment should be made for them for one year to the person receiving them. It is calculated that each child would cost 10*l.*, and the total expense is taken at 14,000*l.* a year. There would seem to be very obvious objections to such a scheme, but that such a scheme should have been elaborately worked out, and that the cost should be treated as a trifle if good can be done to the people, may be fairly taken as symptoms of the new world in which France is living.

It is said that the Cabinet at its last meeting decided to proceed at once with the measures the execution of which has been lately hanging over the religious orders. The present Ministry will therefore not wait, as the DE FREYCINET Ministry proposed to wait, until the Tribunal of Conflicts has given its decision. It has hitherto not been very easy for outside inquirers to ascertain what it is that this Tribunal is to decide, or to understand why M. DE FREYCINET attached such great importance to its decision. There is, of course, the political question whether it is wise and right to call suddenly into vigour laws which have been for the greater part of a century in abeyance. But this is a purely political question, and the Tribunal must take cognizance of all existing laws if their authority is invoked. It is only a point of law which a tribunal can discuss, and what it was desirable to learn was what was the point of law which, the existing laws relating to Congregations being accepted as in force, was considered open to discussion. A long letter from M. CONSTANS to the KEEPER of the SEALS has just given every explanation that could be wished for. The Civil Tribunal of the Seine pronounced on the same day two judgments which M. CONSTANS insists were contradictory, and one of which seems to him to have been as good as the other seems bad. In one case the owner of a chapel closed by order of the Government asked to be placed in enjoyment of his property, to use it as he might think proper. The Tribunal held that the purpose for which he had used this chapel and wished to use it was in direct contravention of a decree of the year 12 of the First Republic, which is still in force, and the application was refused. In the other case, a tenant who had been expelled from the premises on which he lived asked to be allowed to go back again. These premises belonged to a partnership of which he was a member; the partnership was legally constituted, and he asked for his rights as a partner. He did not come before the tribunal as a Jesuit, but as an owner of property. It is an acknowledged principle of French law that when an administrative act raises a question of property, a civil tribunal is competent to pronounce whether the administrative act does or does not improperly infringe proprietary rights. The Tribunal held that the proprietary rights of the Jesuit were not touched by the laws under which Jesuits could be expelled. The Jesuit might be sent off the premises, but the proprietor might come back. M. CONSTANS argues with incontestable force that, if this is the law, the decrees permitting the expulsion of Jesuits are rendered wholly nugatory. This is so, but still the law is the law, and it is so very important to Frenchmen generally that the Administration should not be allowed to encroach more than the law permits on their proprietary rights, that the question raised by the decision of the Tribunal was felt to be one of national and universal importance. What M. DE FREYCINET feared was not so much the reproach that he was harassing the religious communities as the reproach that under his guidance the Administration was riding roughshod over the law.

MR. GLADSTONE AND THE PORTE.

THE latest resolution of the SULTAN is like the lucky thrust of an unskilled fencer, who makes a hit in ignorance of the rules of the art. It is perhaps not very dignified to defy Europe in the first week of October and in the second week to concede all that was immediately required; but the Turkish dynasty and Government have more important things than dignity at stake. Surprised and disappointed by the prevalence at the last moment of prudent counsels, Mr. GLADSTONE'S undiscriminating eulogists boast that the concert of Europe exhibited in the naval demonstration has after all attained its object. Some of them must nevertheless be aware that the surrender of Dulcigno indicates the end of the joint action. The demonstration was already over when the squadrons retired to their present anchorage. The English Government, having abandoned the project of bombarding Dulcigno, was desperately endeavouring to persuade the other Powers to engage in more serious hostility with Turkey. That the English nation has never sanctioned a warlike policy, and that there is no reason of justice or expediency for an attack on Turkey, are secondary considerations with a Minister who believes that he has been entrusted with full powers by the dominant democracy. From the first the union of the Powers was incomplete and precarious; but it was a considerable achievement to have persuaded them to join in the demonstration. At the moment when the concert was falling to pieces the SULTAN seemed to play into Mr. GLADSTONE'S hands by his audacious defiance. France, Austria, and Germany, though they were not disposed to perpetrate a seizure of Turkish commercial ports, were naturally reluctant to retire at the moment when the Porte had challenged its adversaries to do their worst. If he had been advised by statesmen of the Machiavellian type, instead of by Palace favourites, the SULTAN could scarcely have taken a course more embarrassing to his English and Russian enemies. At a moment when coercion was intermitted he voluntarily performed his obligations under the treaty; and henceforth he will have to deal only with two or three Governments which must base their future demands, not on covenanted rights, but on alleged political expediency. Even Mr. GLADSTONE'S popularity will perhaps not survive the enterprise which his flatterers wish him to undertake.

The SULTAN'S retractation of his refusal to surrender Dulcigno is with much probability attributed to the advice of the German Government. The EMPEROR, though he had lately declined the Turkish request for assistance, is well known to have refused his consent to ulterior measures of coercion. It is not unlikely that he may have substituted sound advice for direct aid, with the understanding that compliance would be rewarded by the goodwill, if not the protection, of Germany. The SULTAN may perhaps have been informed that it was impossible to acquiesce in the language or substance of his late Note, but that, if he would put himself in the right on the Montenegrin question, the influence of Germany would be exerted in his favour, and that at least the German fleet would take no part in further operations. The same policy will confirm the determination of the French Government and people to maintain peace; and Austria is identified in interest with Germany. The two Powers will probably succeed to the protectorate which Mr. GLADSTONE has renounced; and if they find the dependent alliance of Turkey advantageous, no ethnological prejudices or ecclesiastical animosities will be allowed to interfere with the pursuit of their own interests. If the newspaper press of Germany or of France represents national opinion, no enthusiasm which could be applied to warlike purposes exists in either country. It is said that the English Government lately, with much politeness, offered to concede to France the leading share in the compulsory extension of Greek territory. M. DE FREYCINET was reminded that the informal recognition of the claims of Greece, which had been excluded from the Treaty of Berlin, was inserted in the record of proceedings in compliment to M. WADDINGTON,

who might otherwise have been suspected of contributing little or nothing to the work of the Congress. The French Plenipotentiary had probably not intended to incur on behalf of his country any obligation to execute the stipulation to which Turkey had not been a party. Whatever may have been M. WADDINGTON'S purpose, his successor was fully determined to renounce the burdensome honour which the English Government proposed to thrust upon him. Not to be outdone in courtesy, M. DE FREYCINET recognized the right of the Power which had invented the naval demonstration to vindicate the pretensions of Greece as of Montenegro. It may be taken for granted that the present Foreign Minister of France will be equally deferential. Before he acceded to office M. BARTHÉLEMY ST.-HILAIRE published his opinion that the only sound policy for England to follow was that of Lord BEACONSFIELD. His recent experience of Mr. GLADSTONE'S passionate efforts to reverse the policy of his rival will probably not have reconciled him to a system of sentimental adventure.

It is possible that among Mr. GLADSTONE'S reasons for enforcing the surrender of Turkish territory to Greece some may be not unbecoming a statesman. There is no doubt that any considerable addition to the power of the Greek kingdom would be unpalatable to Russia, because it might operate as a check on the extension of Slavonic influence and territory. It may also be admitted that Janina and the other places in dispute would be better governed, more prosperous, and more contented, under Greek dominion than in their present condition. If a wish or a despatch would persuade the Turks to comply with the decrees of the Conference of Berlin, the object which might be so cheaply obtained would be beneficial and justifiable. There is nevertheless little use in considering an imaginary condition of affairs. In all probability the Turks will only yield to force, and England has neither the right nor the duty of compelling their submission. Even the wildest Liberal must allow that there is a presumption against an attack on an unoffending State. The maladministration of Turkish provinces, and the probability that they might under new arrangements be better governed, are not legitimate causes of war. Mr. BRIGHT, indeed, once applauded the spirit of the Crusades, which Mr. GLADSTONE is now practically reviving; but the notion of a religious war with Mahometans on behalf of members of the Orthodox Eastern Church might till lately have been deemed obsolete. The English Government may be well assured that the co-operation of Russia will only be afforded for Russian purposes. If Mr. GLADSTONE, in defiance of justice and international law, blockades Smyrna or threatens Constantinople, Russia will perhaps take the opportunity of giving the signal for the outbreak of which she has prepared the materials in East Roumelia and Macedonia, and in Bulgaria and Servia. The objections of detail to the seizure of the Customs of Smyrna or Salonica would be in themselves conclusive; but the enterprise of an unprovoked war would be more unpardonable than the most perverse selection of means for injuring the involuntary enemy. If Lord BEACONSFIELD is capable of preferring the humiliation of an adversary to the interests of the country, he may perhaps look with complacency on the embarrassments which have been wantonly incurred by his successor. The most plausible pretext for a war with Turkey for the aggrandizement of Greece is founded on certain assurances which are supposed to have been made by the English Minister at Athens during the war. It is not stated that his deprecation of an unjustifiable attack by Greece on Turkey was enforced by any definite promise, and it is impossible to believe that the English Government can have pledged itself to go beyond the exercise of good offices. At the present moment Turkey professes its willingness to concede the greater part of Thessaly and a portion of Epirus. The Greeks themselves are too weak to conquer the territory which they aspire to possess; and it is doubtful whether the prospect of war is acceptable to the population. It is said that large numbers of patriotic Greeks are taking refuge at Constantinople from the necessity of serving in the army. The excuse for hostile measures on the part of England must be the decision of the Conference of Berlin. Whatever may be the extent of the authority of the Great Powers to rearrange the frontiers of other States, England would occupy a strange position in executing the judgment which Germany, Austria, and France decline to enforce.

CORRUPT BOROUGHS.

THE story told by Sir JULIAN GOLDSMID of his contest at Sandwich adds a new element to the monotonous annals of electoral corruption. It gives the picture as taken from the point of view of a candidate who loathes the constituency which he is supposed to be wooing. On a Monday morning Sir JULIAN GOLDSMID came to take possession of what he believed to be a safe Liberal seat. By Friday he had only one object in his heart—to disfranchise the borough which he knew would not return him. He found that not a single person in the borough meant him to be returned. He was only there to make his opponents bleed. A Conservative was to win because the Conservatives had given it to be understood that unless they got their man in they would never again spend a shilling in the borough. This was so awful a threat that the constituency felt, directly they believed the threat to be in earnest, that they really had no choice. The borough must stand up for its right to have money spent on it. What was coming was foreshadowed to Sir JULIAN GOLDSMID immediately on his arrival by his agent, who welcomed him with the remark that he was so glad they were to have a contest. It was, to say the least, chilling to the Liberal candidate, who was coming to replace with the utmost ease a Liberal who had been made a peer, that he should be told by his own agent that it was delightful to think that a Liberal was going to contest the seat. The next day he was asked for 200*l.*, and a few hours afterwards for another 300*l.* He thought this rather strong, and said that, in his opinion, payments should be made after an election, not before. But his agent mildly replied that at Deal the custom was to pay ready money at election time. Then, on every side Sir JULIAN GOLDSMID saw illegal expenditure going on which he was meant to pay for. He remonstrated; but his agent told him that this kind of expenditure was also another custom at Deal. The unhappy candidate had serious thoughts of retiring at once, but he feared that the Liberal leaders might not sympathize with his difficulties, and might reproach him for giving up a Liberal seat without a struggle. So he determined to go on; and, when he was informed that 1,500*l.* more must be forthcoming, he decided to pay the money. But, before he paid it, he had finally made up his mind what he would do. He would wipe out Sandwich from the Parliamentary roll. He came to bless, and remained to curse; and he could not conceal in his bearing the set purpose of his mind. He was, as he says, boiling over with indignation; and he presented to the astonished electors the curious spectacle of a candidate who went about canvassing with unmistakable signs on every lineament that he hated and despised those whom he was addressing, had little hope that they would vote for him, and did not care a straw whether they voted for him or not. Directly the poll was over he made his arrangements for petitioning. This was sad news for Sandwich. The terrible day seemed approaching when no more money would be spent by any candidate. Everything must be done to avert so great an evil, and Sir JULIAN GOLDSMID received an offer that, if he would but abandon the petition, his Conservative rival would take the Chiltern Hundreds, he himself should be returned without a contest, and all his past expenses should be paid. But this was not at all what he wanted. He longed, not to sit for Sandwich, but to disfranchise it. He went on resolutely along the path he had marked out for himself, and his work of vengeance is now all but complete.

There were some special circumstances at Sandwich which distinguish the last election there from other contests in corrupt boroughs. But there was one feature in the Sandwich contest which finds parallels in every other contest of the kind. This is the utter helplessness of the candidate. He says, and for the most part he says honestly, that he will not have anything to do with illegal practices. No one pays any attention to his remark. It is thought that, if he asks his party in the constituency to return him, he is pledged to his party to wish to win, and then his party is at liberty to decide how he is to be made to win. When the wirepullers of the party have decided that, in deference to the traditions of the constituency, or owing to the exigencies of the hour, something very strong and illegal must be done, there is no restraint whatever on the execution of their purpose. The extraordinary extent to which corruption of different kinds prevails in corrupt boroughs is one striking revelation of

the Commission now sitting. It is not that a few dishonest poor men, whose votes can just turn the scale, are won over. The whole, or nearly the whole, constituency plays the same game. Witnesses gravely discuss at Boston whether there were ten pure voters at the last election or none. Every one seems to have been paid at Deal for putting up a pole, except those who were paid for looking at the pole when it was put up. The other main revelation which the proceedings of the Commissioners have furnished is that there is no existing check, legal or moral, which tells on a constituency that has got accustomed to corruption. This does not, of course, mean that existing checks are altogether ineffectual. They exercise a most salutary influence in keeping corrupt practices from establishing themselves in pure constituencies. But where they are meant to tell most they do not tell at all. The personal innocence of the candidate is no safeguard. A sanguine friend advances the money. When everything is over, he lets the candidate know that he has paid so much out of his own pocket, without descending into particulars; and the candidate asks no questions, but cannot bear that a friend should have paid anything for him and should not be repaid. There is, no doubt, the fear of a petition; but the candid confession of a Conservative agent at Boston deserves consideration when petitions are thought of. He said that, seeing what was being done on the other side, he came to the conclusion that he must at once spend 1,000*l.* in direct bribery, and he spent it. He calculated the cost of a petition, and thought it would come to more than 1,000*l.*; and he bribed because it was cheaper to beat his adversaries by bribing than by petitioning. And, whatever may be the feelings of those who are supposed to manage the election, they are powerless under the pressure of those with whom they have to deal. The electors will have money and beer and illegal employment. They must have their children employed as messengers. They insist on putting up poles, and drinking after they have done their work. They besiege, bully, and harass those who they think are bound to spend money on them, and extort rather than receive what they ought not to get. In the worst kind of boroughs it is the electors who demoralize the candidates, and not the candidates who demoralize the electors. Possibly the only thing for an honest candidate in such places is to go about glowering at those whom he canvasses, and plainly intimating that he wishes his listeners at the bottom of the sea. Of course if he takes this line he must expect to find, as Sir JULIAN GOLDSMID says he found at Sandwich, that there is a very strong local feeling against him.

When it is asked what is to be done with such boroughs, the first thing to bear in mind is that bad boroughs are quite the exception. There is no corruption in large constituencies; there is none in places or districts such as Wales or Scotland, where there is real strong political feeling; and there is none in places where a customary tribute is paid to eminence or to neighbouring influence. If, therefore, it is proposed to deal with the bad constituencies by laying down new general rules, it must be considered how these rules will affect, not only the bad minority, but the good majority. If, for example, it is suggested that more stringent provisions against corrupt practices should be enacted, it is necessary first to consider how these enactments will affect honest candidates returned by pure constituencies. Such men must not have traps and pitfalls invented for them by the subtlety of lawyers. The good of the majority must be the rule. It is probably desirable that the employment of paid canvassers, and of more than a limited number of paid agents, should be forbidden; but the reason is not that such canvassers and agents spread corruption in corrupt constituencies, but that they unnecessarily increase the expenses of an election in all constituencies. If, again, it is proposed to check corruption by enlarging constituencies, the real question is not whether corruption might not here and there be thus got rid of, but whether the introduction of uniformly large constituencies would improve the national representation as a whole. Plans for dealing with each corrupt constituency according to the circumstances of the case are much simpler, and therefore so far preferable. Little boroughs of a corrupt kind may be thrown into the county. In some cases boroughs of greater importance may be disfranchised and the representation transferred to other towns of the same class. But there are towns, like Oxford and Chester and Gloucester, which cannot be disfranchised. The best thing, perhaps, to be done with them is to provide that no writ shall be issued to them for a considerable period of time, a period long enough to give a fair chance of corruption dying out in them. It may be said that, if the county franchise is extended, there must be a redistribution of seats, and then the corrupt boroughs may be dealt with in the new settlement. This is quite true; but then this new settlement must be made on general principles, and not so shaped and twisted as to punish particular boroughs. Corruption must be treated as a special evil requiring special correction, or Parliament will do nothing to put it down.

THE BASUTO WAR.

THE latest accounts from South Africa have caused well-founded anxiety. At Maseru and Mafeteng two considerable bodies of colonial troops are virtually besieged, and at the former place the Basutos sacked and burned the Government buildings and stores. It may be hoped that Colonel BAYLY and Major CARRINGTON will have no serious difficulty in maintaining their positions until the arrival of reinforcements enables them to take active measures; but it can hardly be doubted that the check inflicted on the colonial forces will dangerously excite and inflame the native mind. The result thus far of the attempt of the Cape Government to disarm the Basutos certainly seems to prove that Mr. SPRIGG and the Parliamentary majority have adopted a mistaken policy; yet some of their critics have condemned them on erroneous grounds. The measures which have caused the insurrection had no connexion with ambitious projects, and they were not consciously designed to inflict injustice on the natives. The object of disarming the Basutos was to render impossible the war which has in fact been provoked and precipitated. In an elaborate speech, since published, Mr. SPRIGG contended that it was necessary to repair the negligence of his predecessors, who had allowed large numbers of firearms to pass into native hands. Not only was the trade perfectly open, but native workmen, temporarily employed, were allowed or encouraged to receive their pay in the form of muskets, with which they returned to their homes. As the Minister said, there is no game in the country, and the natives are not in the habit of firing at a mark for amusement. The only possible use of firearms was to make war either on neighbouring tribes or on the dominant race. It was impossible to discredit his statements or to confute his argument, but his practical conclusion appears nevertheless to have been unsound. There was a serious danger, and the best means of averting it have not been chosen. It would have been highly desirable to prevent the acquisition of arms by the Basutos in the first instance; but it was a hasty inference that it was therefore expedient to take away the weapons by force, even although fair money compensation was allowed. It is probable that the possession of arms is regarded as a mark of personal and national dignity, and the Basutos might not unnaturally suspect that the Government had other reasons for its action besides those which it disclosed. The disarmament was regarded both as an affront and as an act of ingratitude. Some of the Basutos had rendered valuable services to the colonial Government in the late frontier wars, and they resented an interference which was at least a proof of distrust. Unfortunately the grievance is well calculated to excite the sympathy of all the native races of South Africa, whether or not they are subject to the operation of the law. Some of the neighbouring tribes appear to have made common cause with the Basutos, and there is great reason to fear that the war, even if the colonists are ultimately successful, may be tedious and burdensome.

Mr. SPRIGG'S principles, if not the details of his policy, may be advantageously compared with the sentimental recklessness of some statesmen of higher pretensions. The present PRIME MINISTER of England bitterly censured his predecessors and the then Government of India for passing an Act by which the importation of arms for the use of the native population was in some respects checked. To many persons it seems better not to arm possible enemies than to suppress insurrection if it should be encouraged and rendered formidable by the possession of weapons; but Mr. GLADSTONE unsparingly condemned a display of want

of confidence, and he complained that the unhappy Indians would, for want of rifles and bayonets, be exposed to the attacks of wild beasts. At the present moment the English Government permits the free sale and the unrestricted possession of arms in Ireland, with full knowledge that they are in almost all instances procured in view of the probability of murder and the contingency of civil war. The error of the Cape Government consisted in an exaggerated estimate of a far more uncertain or more remote danger. There is no reason to suppose that the Basutos meditated rebellion, and the precautions against it were therefore premature. Mr. Sprigg and his colleagues ought to have foreseen that the Basutos would not be satisfied with a money payment, and that they would think themselves ill-treated by being placed in a position of visible inferiority to the European population. In theory all the inhabitants of the Colony possess equal rights; but of course political power is in the hands of the superior race. It was probably unwise to remind the natives that their loyalty was not as secure as that of their European fellow-subjects. It is sometimes the duty of a statesman to disregard constitutional fictions when they clash with the real state of things; but, as a general rule, the process of government is facilitated by a strict adherence to conventional rules.

Any risk which might have been incurred by allowing the Basutos to retain their firearms would have been preferable to the serious struggle in which the colonists are now engaged. A friendly population has been irritated and alarmed into a hostile rising, and the insurrection appears hitherto to be spreading. It may possibly be found, if the war unhappily continues, that the danger apprehended from the possession of firearms by the natives has been exaggerated. It is not asserted that they have acquired any skill as marksmen; and they will find it difficult either to replenish their arsenals or to procure fresh supplies of ammunition. The Zulus, like the Basutos, had brought large numbers of guns back from the diamond-fields, where many of them had been temporarily employed; but when the war broke out they relied almost entirely on their own familiar weapons, and their musketry fire produced little effect. In any event the conflict threatens to be serious. The mounted police and the colonial volunteers, though they seem to be efficient troops, are weak in numbers, and the scanty population of the colony will scarcely provide means for large reinforcements. As in former wars, the Government of the Cape will expect Imperial assistance, which cannot be absolutely refused, although it may perhaps not be granted without regret and hesitation. It is impossible to allow any dependency of England to be crushed by uncivilized enemies. Whatever opinion may be formed of the wisdom or justice of the policy which has caused the war, the necessity of providing aid will be the same. The measures of the responsible Ministry of the Cape will, after all, be less severely criticized than if they could have been attributed to a Government appointed by the Crown, or to political adversaries at home. It is an inconvenience of the present colonial system that the local Governments have rights or irresistible claims, while they acknowledge no corresponding duties to the mother-country. It is some consolation to know that, if the colonies were still governed in Downing Street, they would be even more troublesome.

The war with the Basutos cannot be justly attributed to the remarkable ruler who has just returned from the Cape. Sir Bartle Frere's Ministers must be blamed or praised for the enactment and the execution of the law of disarmament. He has never attempted to disavow or to extenuate his exclusive responsibility for the Zulu war, on which he resolved, not as Governor of the Cape, but as High Commissioner of South Africa. It is true that his personal influence was a principal cause of the accession of Mr. Sprigg's Ministry to power; but he has recently been overruled by a Parliamentary majority, with the acquiescence of the Ministers, on the important question of Confederation. As might be expected, his Liberal assailants blame him for not having overruled his responsible Ministers. It is remarkable that the danger and embarrassment to which the Cape, and more indirectly the other provinces, are exposed has in no degree qualified the gratitude and admiration with which Sir Bartle Frere is regarded by the whole South African community. No colonial Governor in modern times has created equal enthusiasm for his person and his policy. The English merchants who trade with the Cape appear to entertain the same opinion of Sir Bartle Frere's merits. His own judgment, which has never wavered, was plainly expressed in his answer to an address from Natal. He had, he said, in reference to the Zulu war, either rendered a great service to the Colony and the Empire or committed a great crime. It is not necessary to accept either alternative; and it is even possible that he may have conferred a benefit on his country by acts which were not morally justifiable. If the Zulu tribes are not hereafter reunited into a warlike nation, the neighbouring colonies will have been relieved from a serious danger. It is impossible to ascertain whether the attack which was apprehended would in any case have been made. From the time of the annexation of the Transvaal, for which Sir Bartle Frere was in no way responsible, the enmity of Cetewayo was gradually diverted from the Boers of the Republic to the English Government. Sir Bartle Frere gave him deep offence by his partial ratification of the award which had been delivered in favour of the Zulu claims. It is nevertheless probable that he might have shrunk from an actual collision; and it is certain that he gave no sufficient provocation for the invasion of his country. The severe judgment which has been passed by both political parties on the policy of the late High Commissioner is in some degree counterbalanced by his continuance in office under two successive Governments. His final recall was so obviously a result of party politics that it involves no imputation on his character. If his administrative career is closed, he will have left behind him few equals in capacity and vigour.

COLONEL GORDON AND EGYPT.

COLONEL GORDON has written a bitter and angry letter in which he denounces, in the strong language which is always at his command, the Egyptian Government and all its doings. Anything written by Colonel Gordon on Egypt, and especially when what is written refers to the slave trade which he laboured so strenuously to put down, and to the remote districts which he governed for a time with so much vigour, deserves the greatest respect. No one ever gave himself up to an ungrateful task with more pure motives, more complete unselfishness, or a more fixed purpose to do good and nothing else than Colonel Gordon when he assumed the rule of the Soudan. His absolute contempt of danger, only equalled by his absolute contempt of money, his wonderful power over rude barbarians, and the complete confidence which the late Khedive accorded to him, made him the most striking and commanding character in the history of modern Egypt. But before his criticisms on what has taken place since he left are considered there, are two or three preliminary points which deserve notice. Hard as Colonel Gordon worked, supreme as was his authority, noble as was his ambition, he failed in the great purpose he had set before him. He strove to put down the slave trade, and he was beaten. He had to retire sadly confessing that the task was too much for him. He mitigated possibly, but he only mitigated in a very slight degree, the misery which he bewailed. The flood of slaves poured on and is pouring on to this hour. As he himself explains in his letter, the astuteness of the slave-drivers baffles even the vigilance of English cruisers. Then Colonel Gordon had the late Khedive behind him. He had real force in the background, and the Khedive of those days was still his own master. He was fighting his long fight with his creditors and the protecting Governments, but he could always find money for anything on which he had set his heart. It had been for years one of his chief objects of ambition to make Egypt a great African Power, to push forward every claim to new territory that he could invent, and to rest only when he had obtained the command of the Nile from its source to its mouth. He would not listen even to Colonel Gordon himself when this policy was called in question. Colonel Gordon says that he constantly urged Ismail to abandon outlying regions over which his dominion was only nominal. But the Khedive did not carry his friendship for his English counsellor so far as to abandon for his sake the ambitious part of a great African Emperor. He would hold what Colonel Gordon told him he had better let go; but then the mere fact that the Khedive had

an ambitious if unwise policy, and was ready to support it with money and men—not, perhaps, with much money or many men, but still always at a pinch with some—greatly strengthened Colonel GORDON's position. He was an independent ruler, for the Khedive gave over all authority to him; but he had the Khedive behind him. Lastly, Colonel GORDON was not the type of a class. He was himself, and there was no one like him. He could work as no one else could, he wanted nothing for himself, and no one in Egypt, foreigner or Egyptian, dreamt that it was possible he would work adversely to Egypt or in favour of any one foreign Power. When he left, the question was not how he could best be replaced—for it was certainly impossible to replace him—but what was to be done when there was no Colonel GORDON to be had.

The main grievance which Colonel GORDON puts forward is that Egypt is governed by a set of parasitical Pashas. He says that he shall never believe in the regeneration of Egypt until it is governed, not by Pashas, but by an assembly of native Egyptians. The time may perhaps come when there will be native Egyptians competent to form an assembly and to govern themselves; but it may be doubted whether any man now living will see it. The Government that exists in Egypt is the Government of a very well-meaning sovereign with a privileged class to carry on his administration, and a Protectorate over him, which manages his finances, and decides in the last resort what he may or may not do, but leaves the ordinary administration of the country to go on in its own way. This form of Government exists simply because no other is possible, and if we look on the result as a whole, it may be fairly pronounced to be highly successful. The control of the Protectorate is limited, because the Powers that exercise it have come to the conclusion that, if it was not limited, it would cease to exist at all. The Soudan may be badly governed, but neither England nor France will assume the responsibility of seeing that it is well governed, nor would either Power allow the other to take the sole responsibility on itself. With regard to the slave trade, there are some things which the protecting Powers think they can do, and others which they think they cannot do. The KHEDIVE made a contract not to allow slaves to come into Egypt. The Consuls-General keep him up to his contract. A station has been chosen on the Nile where the incoming of slaves can be best watched. There a post has been established which is held by the Government, in strength enough to deal not ineffectually with the traders who are trying to get slaves into Egypt proper. This post does not act as a direct check on the capture of slaves a thousand or two thousand miles off, and it was never meant so to act. What it was meant to do and what it does is to prevent the highway of the Nile being used as the channel for getting new slaves into Egypt. Colonel GORDON says that the slaves themselves gain nothing, for they only pass from the hands of their masters into the hands of the Egyptian authorities. How far they lead a happier life after they have been nominally freed than they would have led if they had been passed as slaves into Egypt, it is impossible to say. But one great object is to discourage the capture of slaves by closing the Egyptian market to the traders, and it is hard to believe that traders are not discouraged when at a post on the Nile the slaves whom they have taken so much trouble to get there are taken from them. The capture of slaves, however, goes on in the remote regions where it is practised because, if the Egyptian market is closed, other and better markets remain open. So far as the districts where slave-hunting goes on are under the nominal rule of the KHEDIVE, the Powers make vague appeals to the KHEDIVE to put down the practice, and the KHEDIVE makes equally vague promises. The KHEDIVE cannot put down slave-hunting. He has no sufficient physical force and no money for the purpose. Colonel GORDON's only suggestion seems to be that Egypt should abandon a rule which is a mere shadow. The KHEDIVE may have some feeling that he does not like to be a smaller man than his father was, and may not like to be the ruler under whose guidance the limits of Egypt have receded. But his great difficulty is that, if he openly said he was going to retire altogether from the slave-hunting regions, and give the hunters free play to do there as they please, he might easily be exposed to a storm of indignation on the part of his European, and especially his English, critics, who would say that he was basely and ignobly encouraging the accursed trade which he is so loudly urged to suppress.

The Soudan, ruled as it is now by a parasitical Pasha, is said by Colonel GORDON to be ruled not only badly, but at a disastrous and ruinous cost. He has fixed on the figure of 150,000*l.*, and he says that this is the annual sum which non-Egyptian Egypt is now costing Egypt proper, and he thinks the creditors of Egypt are entitled to ask that such a monstrous waste of funds that ought to come to them shall no longer continue. Mr. COLVIN, the English Controller-General, has given an explanation as to this sum. There is such a sum as 150,000*l.* needed for the Soudan. But it is not an annual sum; it is not a sum representing the outlay of a parasitical Pasha; but it is a sum which Colonel GORDON when he quitted the Soudan left unpaid. If Colonel GORDON were one of those men over whom it was possible for any one to wish to triumph, this might be called a triumphant explanation. But no one can wish to say a word that could wound Colonel GORDON. He has made a mistake, and that is all. This incident, however, may suggest that Colonel GORDON is rather apt to deal with what he supposes to be facts without sufficiently examining the ground on which he is treading. He tells us that when coming home he met a man in the Red Sea, who told him that the Egyptian Government was going to send an expedition to subdue the Somalis, a wild people on the coast south of Abyssinia. He not only accepts this story as unquestionable, but he discovers in it the manœuvre of a parasitical Pasha, and he calculates the exact sum—50,000*l.* a year—which this conquest will impose as a new burden on the Egyptian treasury. If the Egyptian Government to oblige a parasitical Pasha is going to undertake a difficult and ruinous enterprise, and kill wild people with whom it has no quarrel, and over whom it has, as Colonel GORDON says, not the shadow of a right, it is going to do a very wicked and foolish thing. But it is just possible that the man on the steamer may have been merely gossiping in the ear of a very willing listener. Or it may be that the Egyptian Government has some project with regard to the Somali coast, but may be prompted, not by parasitical Pashas, but by a very different set of advisers. The slave trade between Africa and the Eastern coast of the Red Sea cannot be checked, as it unfortunately appears, in the districts where slave-hunting is carried on; there is no one who can occupy those regions with a force sufficiently overpowering and sufficiently permanent. The trade, again, can only be very partially stopped by cruisers on the Red Sea, for the traders slip by the cruisers at night-time. The only way of checking the trade that is found to be really effectual is to occupy points on the coast from which embarkation takes place. Colonel GORDON has observed, with great satisfaction, that the French have recently occupied one such place and the Italians another. It is not impossible that the Egyptian Government may have been told that, unless it wishes to own that it is powerless to put down slave-hunting, and to give up the shadowy authority it exercises over the regions where slave-hunting is carried on, it must do something to stop the trade, and can at least further the end which the Protecting Powers have in view, by taking new measures to guard the coast.

MORE SOCIAL SCIENCE.

THE discussions of the Social Science Congress could not, of course, be kept on the lofty level of Lord REAY's opening address. We do not mean to imply that Miss LYDIA BECKER, Mr. BOGG, Mrs. DUNCAN McLAREN, and the other ladies and gentlemen assembled at Edinburgh know nothing of diplomacy, or that they would fail in conducting a dispute about the peaceful ascendency of England in the councils of Europe. But there are socially scientific subjects, such as "the abominations of husbands" and of drains, the condition of the stage (which always flutters amateurs), and the education of pauper infants, that come more closely home to the business and bosoms of the scientific. Education, the reporters say, was the most popular subject, especially with ladies, and, as we shall see, some remarks of value were made on this topic. But it was in the comparatively slack and unexciting Section of Municipal Law that Mrs. DUNCAN McLAREN came most prominently to the front, and scored the first knock-down blow on the arguments of Mr. ANDREW JAMIESON, Advocate. The matter under discussion was the property of married

women. From an address by Mr. BOYD KINNEAR we gather that Scotland is in the habit of allowing England to make experiments with married women's property, and, after some years of cautious observation, of adopting the legal change, if it appears to answer. This is cautious, not to say pawky; and the experiment is made *in corpore vili*, "on the abominable body," as Mrs. DUNCAN McLAREN might translate it, of the Southron husband. "As regards Scotland, the changes had followed "those of England at intervals of a few years, a sufficient "time to have discovered any mischiefs that might have "been occasioned." Fortunately, no mischiefs in particular have been discovered, except those appalling ones with the mere mention of which Mrs. DUNCAN McLAREN curdled the blood of the Sections, and the others which were hinted at by Miss LYDIA BECKER. Miss BECKER believes that "many "unmarried women hesitate to contract matrimony through "their unwillingness to come under these objectionable "laws." What a theme for the novelist, especially for Mr. TROLLOPE, is here suggested by the glowing fancy of Miss BECKER! ANGELINA, a maiden of thirty-six, passionately attached to EDWIN and to the rights of woman, still hesitates to "contract matrimony" on account of her dread of our objectionable laws. Thus hearts are broken and Britain is depopulated. When it comes to "the "custody of children" (not of juvenile offenders), Mrs. DUNCAN McLAREN has discovered an unparalleled female grievance. Give the husband the custody of a child, and he will outdo the crimes which we read of in the pages of SUETONIUS, OUIDA, PETRONIUS ARBITER, and similar moralists. "It was a matter of life and death to "women, whose children were being subjected to "the cruelties, brutality, and abominations of hus- "bands." This impassioned sentence is pretty sweeping, and might judiciously have been qualified by the use of such a phrase as "some" or "a few" husbands. Experience does not prove that all husbands, or even the majority of these abandoned men, are cruel, brutal, and abominable. This reflection appears to have occurred to Mr. ANDREW JAMIESON, Advocate; but he did not express his dissent with much caution. He said, rather weakly, that he should like to know "what husbands the ladies "who had spoken had known." Thereon Mrs. DUNCAN McLAREN arose, and scored freely. "Those who have good "husbands are the only women who dare speak on this "question." This was clever; for, as the incalculable majority of women do not speak in public on any question, the inference to the mind of a lady logician is that the incalculable majority of women are under the power of cruel, brutal, and abominable husbands. There is, of course, something "undistributed," or otherwise at sea, in this feminine syllogism:—"Only women who have good hus- "bands speak at Social Science entertainments. Few "women speak at Social Science entertainments. There- "fore, few women have good husbands." The repartee of Mr. JAMIESON was lost in the great laughter and applause which greeted, as OLLENDORF would say, "the wife of the "good husband."

Turning from municipal law to art, the scientific were instructed by Professor FLEEMING JENKIN, who is interested in the stage, and by Mr. HERKOMER, the well-known painter. In reading the brief abstracts of these gentlemen's lectures, one is depressed by the hopelessness of Social Science. She may speak as wisely as the judge did to FALSTAFF, and yet the world does not mark her. Wisdom cries aloud in the Sections, yet the practices of actors and of painters continue to be what they were of old. Professor JENKIN, who afterwards made what we think very sensible and practical remarks on drains, asked "Whether there "should be a School of Dramatic Art, subsidized by pri- "vate subscription and endowment or by the State?" It is a question often and wearily debated in the "light" leaders of the newspapers. It is difficult, of course, to say whether there ought to be a School of Dramatic Art or not. It is pretty certain that just at present the State will subsidize nothing more dramatic than "demonstrations." It remains for private persons to make the experiment, without which all our discussion is baseless and unscientific. Let the first wealthy person who contemplates dying, and endowing "a college or a cat," endow a Dramatic College. There is any amount of money for educational purposes to be had in the great Northern towns. The Manchester, Sheffield, Leeds, and Staleybridge merchants are endowing colleges "all the time," as the Americans say. Let some enthusiast persuade one of these affluent but moribund gentlemen to make a start, to give the rest the lead, and money will flow in profusely. With money enough, we could soon get a Dramatic College, a staff of teachers, and even a Scotch M. SARCEY. Professor BLACKIE, a practical man, saw the truth of these views. He wanted to get a Chair of Celtic Studies founded, and he never let the world alone till he had collected the money, and had done a very considerable service to letters and to his University. Some one else has founded a Chair of Art "at lairge" in Edinburgh, and a young gentleman who once wrote an article in the *Nineteenth Century* has been elected to fill it. What a triumph it would be for Edinburgh if her University could boast what Mr. BURNAND fondly dreams of—a Professor of Dramatics! The stage is not, we fear, very flourishing in Edinburgh. A large and imposing theatre was lately erected near the Castle; but it has come, we are informed, into the possession of the Free Church, and has been converted into some sort of theological college. The Jesuit teachers used to make their pupils act plays, and even dance ballets; but can we expect as much from the Free Kirk? Will Dr. BEGG coach the gay amateurs, while Professor ROBERTSON SMITH gives practical lessons in the Highland fling, or throws off all theological reserve in the evolutions of a reel? Dreams, vain dreams, are these, of a fancy stimulated by Social Science. But to return to Professor FLEEMING JENKIN and the drama. He recognized that French dramatic institutions are the growth of the French soil, and would in England be feeble and stunted exotics. His suggestion was that the dramatic profession should have a Royal Dramatic Society. "The persons eligible would be "actors, actresses, and dramatic authors and musical "composers whose works had been represented on the "stage." But how immense are the difficulties in the way of forming this grave Society, the "fountain of "honour," and the "nucleus round which would gather "many minor institutions"! After all, most professions know their own business. If actors and actresses have never formed a Royal Dramatic Society, it may perhaps be inferred that they are aware of obstacles which would prevent that Society from working. It is exceedingly improbable that the members of the dramatic profession need more advice from the Social Science Congress than is required by lawyers, boot-makers, journalists, glaziers, or any other class of the community. The Congress, however, moved to beg its Council to appoint a Committee to promote the establishment of a Royal Dramatic Society. The profession ought to be sincerely grateful to the Council, also to Mr. CHARLES ROWLEY (junior), who read a paper on "Remedies for Staginess." We do not observe that any actors took any part in these deliberations; but a paper on Dramatic Art by Mr. BOGG was read, and it really seems a pity if no managers were present to learn something from the researches and reflections of Mr. BOGG.

In the discussions on education Lord BURLEIGH's address seems to have been most sensible and to the point. He regretted the tendency to make a break between the Scotch schools and the Universities by the neglect of Latin and Greek, and by the cramming of some uncomprehended scientific facts out of primers. In old times the Scotch parish or grammar schools, especially in Aberdeenshire, gave boys a thoroughly sound training in Latin scholarship, especially in the composition of Latin prose. Men who passed through this discipline, and who have had to abandon classical studies, confess the clearness which it gave to their ideas, and the lessons of accuracy in thought and speech which it taught. Again, as Lord BURLEIGH said, the neglect of Greek, Latin, and mathematics is a practical and a "poor man's" question. The beginning of the knowledge of these things is the first step towards a rise in social life. A little Latin is certainly of much more value, as a foundation of knowledge, than a smattering of animal physiology. In short, the modern system cuts away two or three of the lowest rungs of the ladder by which poor and clever Scotch boys have climbed to the best things in human life.

If these ideas can gain ground, the Social Science Congress will not have been held in vain. But even more important is Professor FLEEMING JENKIN's sanitary advice. He described the formation of a Society in Edinburgh of which each member, for an annual subscription of a guinea, receives a professional opinion as to the sanitary condition of his house. The members are no longer at the mercy of

plumbers; and London should in this respect make haste to follow the lead of Edinburgh. The suggestion of such a scheme is the most golden fruit, "atop on the topmost bough," of Social Science.

TRADE IN SEPTEMBER.

THE Board of Trade returns for last month fully bear out the conclusion at which we arrived a fortnight ago when discussing the prospects of trade. They show that business continues to improve, and they afford reasons for hoping that the improvement will be permanent. It will be recollected that it was in the September of last year that the commercial revival first distinctly manifested itself. In the previous May, and again in July and August, there had been slight increases in the exports, but these were generally regarded as more casual fluctuations. It was not till September that the improvement became so decided as to forbid any such explanation. Even for some time later the belief was widely held that the improvement, after all, would turn out to be no more than a spurt. But month after month passed, and still the increased activity continued. Yet the lurking doubt was not altogether removed, and some people were prepared to find, when the comparison came to be instituted with a month of undoubted revival, that the improvement had ceased. On the contrary, there is a marked increase on last year's increase. Confining ourselves for the present to the exports of British and Irish produce and manufactures, we find that last month they showed an increase of 2,625,000*l.* on September 1879, being at the rate of over 15 per cent. For the nine months of the year already elapsed the increase amounts to very close upon 27 millions, or over 19 per cent. We have thus ascertained a fact of peculiar interest as regards the economic development of the country. It used to be assumed that recovery from a protracted depression could be brought about only by a series of bountiful harvests, and in the United States and other raw-material-producing countries this is undoubtedly true. But as regards England the proposition requires to be greatly modified. The wheat harvest of last year throughout the United Kingdom, certainly throughout England and Ireland, was the worst of the present century, and it followed a series of seven deficient harvests out of ten. Moreover, nearly all other crops were bad. Barley was no better than wheat; potatoes were a failure; and grass was disappointing. To put the climax to the farmers' troubles a pestilential disease decimated our flocks of sheep. The Continent also suffered from a short harvest, and was bidding against us in the markets of the world. Yet, in spite of all this, a revival of trade set in just when the badness of the harvest began to be fully realized, gained strength through the agricultural year, and now, when another harvest has been gathered in, is advancing with a fresh momentum. The truth is that under the *régime* of Free-trade our home harvest has ceased to be of vital importance to our food supply; while the growth of wealth and trade and industry has been so vast that the distress of even our greatest single industry, as agriculture still is, cannot prevent a revival of trade when the other conditions favourable to it are present. The United States, having recovered prosperity by a series of three abundant harvests, imparted activity to our trade by their purchases, and awakened once more the spirit of enterprise and speculation.

We have spoken thus far only of the exports, because there are persons who still insist upon regarding imports as so much subtracted from the wealth of the community; but, as a matter of fact, it would be more reasonable to look upon the exports as deductions from our wealth. It may be admitted that to import commodities which we could raise for ourselves without diverting capital or labour from businesses in which they are employed more advantageously is a thriftless proceeding, and thriftlessness necessarily deducts from the national wealth. But the imports which we cannot so produce are so much added to our means of enjoyment, and, in short, are the price paid by other communities for our produce and manufactures. An increase of imports is really, therefore, a proof of well-being and increased wealth. Last month the augmentation in our imports, as compared with September 1879, was, in round figures, 6½ millions sterling, being at the rate of 23½ per cent. For the nine months the increase was 50½ millions, or 19½ per cent. For September alone the rate of growth was much higher in the imports than in the exports, but for the whole nine months it was nearly the same in both—19·5 per cent. in the imports, and 19·2 per cent. in the exports. If we proceed to inquire in what class of articles the increase in the imports has occurred, we find that it was decidedly largest in the raw materials of manufacture. That is to say, to a very large extent the money we have laid out with foreigners was of the nature of an investment, intended to give employment to our workpeople and profits to our capitalists. The total increase in the value of the imports last month was 6½ millions, and three of these millions are in the following sixteen articles—raw cotton, flax, hemp, raw hides, indigo, jute, raw silk, wood, wool, unwrought copper, iron ore, lead, pyrites, tin, flax seed, and tallow. This list does not include all the raw materials of manufacture, much less does it include partially manufactured articles, such as dressed hides, yarns, &c.; yet it represents nearly half the increase of the month upon the imports. One safe inference from this is that our manufacturers have recently found their business profitable, and that they have good grounds for expecting that it will continue to be so. In articles of food the increase on the month is about two millions, the increase in quantity generally being larger than that in values, showing that we have obtained more for our money than we did twelve months ago. It is curious that even of wheat there are increased imports, though our harvest this year is so much better than it was last year. Chiefly, no doubt, this is due to the fact that successive bad seasons had caused our stocks to run very low. Last winter a ring of speculators at Chicago attempted to force up prices artificially by limiting the supply allowed to come forward, and their efforts were only defeated by the prudence of buyers in this country, who proportionately restricted their purchases, buying only from hand to mouth. The contest was continued to the very eve of the harvest, and had for its effect the running down of stocks in this country. At last the comparatively abundant harvests compelled the Americans to sell, and the reduced prices tempted buyers here.

In our exports there is no longer that extraordinary increase in the shipments of iron and steel which last year was the first sign of reviving trade, and which for many months continued to present the most striking feature of the official returns. There was in September an increase, it is true; but it was very slight. The effects of the wild speculation of the winter are yet felt in America, and under existing circumstances the United States produce very nearly as much as they require. But the English manufacture is superior to the American, especially in steel, and it seems not unlikely that when the Presidential election is over a new impetus may be given to railway construction. Even now, indeed, orders for steel rails are from time to time given. But, however this may be, the check to the iron and steel exports serves to show that the revival is not dependent upon the prosperity of a single country and its purchases of a single commodity. Although the shipments of iron and steel were last month but little more than those of September 1879, the total exports showed an increase, as we have seen, of 15 per cent. This is the really satisfactory feature in the returns —that the expansion of our trade is not in a few branches only, but is general. Nearly every country is a better customer than it was, and often for several classes of goods. The most notable exception is Germany, whose purchases have fallen off under the action of her new protective tariff. On the other hand, the raw-material-producing countries are all better customers. This is the case not only with the United States, but with India, Australia, Brazil and South America generally, Turkey, and Egypt. The peculiarity of the late depression, as we have often remarked, was that it originated in the temporary exhaustion of the purchasing power of the raw-material-producing countries. They have now recovered that power, and we are feeling the effect of it. We need hardly observe that the universality of the increase in our exports encourages the belief that the revival will be more than temporary. The increase is found in chemicals, coal, cotton goods, hardware, iron, machinery, linen, jute, and woollen manufactures. It is thus general, not only as regards the countries which have become better customers, but also as regards the trades in which they have bought more largely. It is, however, in cotton goods that the increase is most marked. Both in quantity and in value it is about 19 per cent. It is found in the shipments to all the raw-material-producing countries, but

it is most marked in those to India. In fact, India took last month about 29 million pounds of cotton goods more than in the September of last year. The magnitude of the cotton exports to India during the past twelve months shows the far-reaching effects of drought in India. While the famine lasted, the people were unable to afford themselves new clothes; but now that prosperity has begun to return, they are replenishing their wardrobes. It must be remarked, however, that prices have been very low. If low prices continue, the trade will probably continue to be large, but any considerable rise in prices will be likely to restrict it. On the whole, then, we come to the conclusion that the prospects of trade are encouraging. Business continues to improve in all departments, and there are signs that it may improve still more rapidly by and by. One favourable symptom is that the wild speculative spirit awakened twelve months ago no longer endangers the permanence of the revival. In its place there is prudent circumspection. The improvement is thus so gradual that prices remain low enough to tempt buyers, and profits are so moderate that even serious labour disputes do not disorganize industry.

PROMISING YOUNG MEN.

PERHAPS the least vulgar type of lion-hunting is the looking out for the germs of future greatness. A man of established reputation in literature or art is an object patent to everybody's view, and to pay him honour is merely to do what others are doing. The young man who is just beginning to attract attention is a less conspicuous object. To spy him out quickly implies a certain amount of individual discrimination, as well as access to the inner circle of competent judges who are likely to set the future fashion of appreciation. One does not wonder, then, that the young man of promise figures as an object of special interest in refined society. This interest is sustained, too, by a number of amiable impulses. The imagination finds more to busy itself with in a newly-budding talent than in one in full flower. In all things promise is more attractive than realization, and the anticipation of the future development of a mind, seemingly bearing the impress of genius, offers a fine range of imaginative pleasure. Kindly motives come into play, too, in this consideration of nascent greatness; a good-natured person has the feeling of furthering a beneficent purpose in bringing forward one whose claims to attention are not as yet widely known. Thus it happens that women of generous impulses and active sympathies frequently make a *protégé* of a promising aspirant to fame. The French Salon in its best days offered an excellent opportunity for this exhibition at once of a superior feminine insight into merit and of a chivalrous advocacy of unrecognized claims. In our duller contemporary London drawing-room, too, a good deal of this same interest in rising talent is observable, even if it be less sagacious and less purely intellectual. There are some houses where one generally expects to have pointed out a new luminary in science or literature just rising above the horizon of public recognition.

The situation of such a promising young man seems at first sight a purely enviable one. To receive marks of lively interest and respect at an age when the thirst for recognition is at its keenest, to set a number of young women dreaming of one's future glorious achievements, and a number of less fortunate young men bewailing their fate, may well intoxicate a mind that is not wholly given up to ardent ambition. This first taste of the sweets of popularity is among the few sensations of a lifetime that are never forgotten. Indeed we may say that, to realize one's own brilliant success in this way prospectively, and through the eager hopes of a few warm admirers, is the most delicious mode of enjoying success. Yet no form of human bliss is quite free from taint of imperfection, and even the youthful aspirant who has succeeded in awakening this romantic interest in his future finds that there are drawbacks to his delight. It not infrequently happens that this newly awakened admiration is very unintelligent. Where there is very little actual performance to build upon, people easily get erroneous ideas of a man's special capabilities and aims. A newly created hero has to be magnanimous, and to submit with good grace to a great deal of foolish misapprehension. In most cases he must be content to be recognized as tending to greatness, without expecting people to understand wherein exactly his greatness is likely to manifest itself. The situation will sometimes be a trying one. If, for example, one of the newly-formed circle of admirers puts the hero of the moment through a long and searching examination under an exaggerated idea of his attainments and powers, he will very likely feel bored, and be ready to anathematize the inconveniently importunate questioner for not having taken the trouble of ascertaining his real position and pretensions. All such carelessness will be apt to appear to the more sensitive kind of aspirant as a mark of insufficient interest, and the degree of vexation which this reflection will bring with it will be directly proportionate to the intensity of the first delight.

It is, however, in relation to the future that the position of a promising young man is most beset with difficulties. When society thus advances its meed of praise in return for a promissory note, it is apt to be somewhat exacting. The young writer or painter who has excited this lively interest in his future must make up his mind to be carefully watched. And the very people who were most unreflecting in taking his future reputation on trust will be apt to be equally unreasonable in their expectations. If we add to this that the first conceptions formed, as has been observed, are very often quite erroneous and greatly exaggerated, we see in what an awkward situation the promising young man is likely to be placed. Even if he does advance according to his own anticipations, and fulfil all the hopes that could reasonably be grounded on his first performances, he may excite a measure of disappointment. And then it sometimes happens that, through no fault of his own, his young talent does not go on developing as it ought to do. Nature provokingly orders that in the fuller life of manhood, as in early life, precocity should sometimes be followed by mediocrity. The pledge given by college reputation, and even by the first essays in public life, is sometimes illusory, just as the pledge given by exceptional infantile endowments. And when this happens the promising young man may be said to be hardly used. He is not only foredoomed to personal disappointment, but is made the unwilling instrument of others' disappointment. On the whole, however, it is probable that society is not unjust in demanding a fulfilment of the early promise which it has recognized and honoured. Allowing for an occasional arrest of intellectual development, and for the interruptions of progress by feeble health, we must admit that most of the disappointments that occur are traceable to a want of persistence in the promising aspirant. Many who are possessed of considerable natural powers are not indisposed to make a short, strenuous effort after greatness, though they much dislike long and sustained exertion. With such the first sip of flattering recognition acts as a narcotic; it brings a perfect content with the present, and paralyses the organs of action. The very sweetness of the prospective enjoyment of full success may easily render the mind which is not too deeply devoted to the ends of truth or beauty indifferent to a future realization of anticipations. The only guarantee against this early defection from lofty aims is the existence of strong and genuine devotion and high conscientiousness, and these qualities do not appear to be common.

While there are many who thus abandon effort in literature and art through the undermining influence of an agreeable lethargy, there are others who do so because their incipient success has brought them other and more material advantages. Distinction is an obvious passport into society, and promising young men, finding this out, are under a temptation to forego further celebrity in favour of the material rewards which social position brings with it. We have heard it said of more than one promising writer that he would have made his mark in literature had he not married a woman of society. In his case there is clearly no room for excuse or explanation. When a youthful aspirant in literature relaxes effort under the sedative influence of present partial success, a serviceable friend may proffer a plausible excuse, putting down the later inactivity to overwork and consequent debility. But when a man deliberately binds himself by social ties which are incompatible with a hearty carrying forward of his early plans, his want of sincerity and depth is patent to all. Such temporary aspirants must therefore be ready to brave the resentment which naturally follows the willing extermination of agreeable hopes. They generally manage to put a good face on the situation, which is apt to seem a little ludicrous to a thoughtful onlooker. The gains accruing to them from their change of life are sufficiently real and palpable to render them callous to the contempt with which their former admirers and well-wishers are apt to visit their infidelity.

Contemporary society offers a large number of instances of abortive literary achievement. The men whose career of public service is thus cut short manage to retain the footing which society accorded them in the days of their promise, and that is all. They constitute a somewhat gloomy element in the London drawing-room, a sort of faded fringe to the social texture. They stand as sad memorials of early illusion rudely dispelled. How many of them are themselves responsible for this non-fulfilment of past pledges, it is of course impossible to determine. One would like to take a charitable view, and to believe that a large proportion of the cases fall under the head of arrested intellectual growth and of impaired health. Yet truth compels us to say that the other causes enumerated above—namely, indolence and a preference for tangible possessions—appear to co-operate at least in a very large number of instances. Men with literary and artistic taste, and even men with a degree of scientific interest, share with ordinary mortals the dislike to protracted and severe labour. And the deeply-rooted love of ease easily disposes a man after a measure of toil to listen to the soft voices wafted from the drowsy air of the Castle of Indolence. He may not fully recognize the motive which holds him back; the love of ease will readily disguise itself under the form of a sense of impaired vigour. It is this motive, we suspect, which has most to do with the frequent cessation of hopeful endeavour in public life, and which makes it true of literary service, as of other kinds, that many are called but few are chosen.

It might perhaps be expected that, in view of so many disappointments, society would grow more chary in the recognition of early signs of distinguished ability. And there is no doubt that a certain measure of caution in this respect would be a very good thing. It is, of course, well enough to encourage first efforts by a

just recognition, but this is a very different thing from hastily making a hero of the beginner in science and art before he has fully won his spurs. A man who is sincerely devoted to the ends of truth does not need the stimulus of this prospective applause; he can wait for a later and fully earned praise. On the other hand, the prospect of this rapid social recognition serves to incite the half-hearted and the pretentious to a fleeting and deceptive effort. Yet we very much doubt whether people will ever grow wiser in this respect. The motives which lead them to take up a new comer who seems to give promise of intellectual distinction are too powerful to be readily curbed by considerations of prudence. A new figure in the world of letters is too interesting a phenomenon to be passed by; even if the eager admirers face the possibility of being deceived, they are scarcely likely to withhold their interest. The selection of a promising *protégé* may be made all the more exciting and pleasant by the presence of an element of uncertainty. It seems specially chivalrous to back up a young aspirant whose career is by no means assured. And so we may be pretty certain that good-natured people will, in spite of frequent disappointment, continue eagerly to accept and endorse literary and artistic promise whenever it makes its appearance.

COLLEGE EXPENSES.

TO-DAY is the first day of Michaelmas Term at Oxford. The station is crowded with the luggage, and the cabmen are rejoicing in the tips, of emancipated freshmen. The freshmen themselves go, with a subdued shyness or a lordly swagger (they seldom know any medium), to their rooms, order their own lunches, and supply their scouts with their earliest perquisites. Among so many young men it may be predicted with complete certainty that a few will get into debt. This very day they will begin to run up what Oxford has called "ticks" for more than two hundred years, for cigars, wine, clothes, horses, tennis, billiards, pastry, books, bindings, pictures. Nothing can save the fast foolish freshman, though perhaps the College might make it more difficult for tradesmen's touts to invade his rooms after breakfast, and tempt him with worthless engravings and fabulously bad water-colours. But the fast freshman must go his own way with more or less velocity. No general reforms can really cure his absurd extravagance. The extravagance that can be checked is that which some of the Colleges actually impose upon their undergraduate members.

In the current number of *Fraser's Magazine*, a writer who signs himself "An Oxford Tutor" has analysed the yearly charges of, let us say, Boniface College. The "battels" of that ancient and famous home of learning have long been matter of rueful mirth to the undergraduates. As the evil was beyond cure, the men have been fain to laugh at it. Till they came to receive publishers' accounts, in later years, many of them believed that Boniface bills were an original and unprecedented jest. This was not a perfectly accurate view, but a little attention will show what a true humourist the bursar must have been who first devised this system of accounts. Before going further, however, we must guard ourselves against being supposed to think Boniface a sinner above all other colleges. No college, on the other hand, has done more, or perhaps so much, to make men take their life at Oxford in earnest, and at few places are the undergraduates more fortunate in the society of tutors as sympathetic as they are learned, self-denying, and industrious. But they have all borne the yoke of Boniface bills in their youth, and perhaps have come to regard them as part of the divine system of things, and not alien from the scheme of the universe as devised by Hegel. Indeed the "notion" of that favourite philosopher is very manifest in the bills—the "notion" in this case being the determination to get as much money as possible out of the undergraduates. Perhaps we may say that this "notion" is implicitly present in the whole of University existence, and has "relations co-extensive with the University."

The expenses at college are, to a certain extent, within the control of the individual student. He may give breakfasts, luncheons, dinners, and other entertainments, of which the staple is supplied by the college kitchen and buttery, or he may give none. He may drink wine, or confine himself to beer; he may revel in "Portuguese" and "New College pudding," or may restrict himself to bread and cheese. But, be he hospitable or niggardly, luxurious or sparing, he must pay yearly to Boniface College in "General Accounts" the sum of 77*l.* 17*s.* 6*d.* No economy on his part can reduce that charge, at least if he lives in college. Let us examine the items of this not inconsiderable sum, with the aid of the "Oxford Tutor."

In the quarterly accounts the first charge is thus described:—"Common Room:—University dues, College dues"; and these amount annually to 1*l.* 8*s.* The meaning of the charge is a mystery; nor is it made clearer by the reappearance of "College Dues" to the amount of 4*l.* 12*s.* 6*d.* The sum is perhaps a perquisite of the College; or can the "dues" be owed by the College to some feudal superior, and merely collected by the College from its undergraduate members? The item seems to answer to "Allowances to the Trade" appearing in the bills of publishers after the allowances have been allowed for. The next item we propose to notice is "Bedmaker," whose wage reaches 4*l.* annually. Say there are one hundred and twenty men in college, this gives 480*l.* per annum for perhaps twelve bedmakers' services in the twenty-six weeks of term time. To this we must add some three or four pounds a year in "private donations" from each undergraduate. This will give each bedmaker some seventy or eighty pounds for the services of twenty-six weeks. With the addition of all the fragments of luncheons and wines, and a communal interest in trifles like marmalade and corkscrews, the bedmaker seems fairly well paid. But, like college dues, his little bill recurs again and again in the general account. Each undergraduate yearly pays 4*l.* to "General Expenses." We used to marvel what "General Expenses" could possibly be; but it seems they are short for "gas, water, salaries of servants other than bedmakers, *part of bedmakers' salaries!* waiting in hall, junior bursar's salary, &c." The joke is even better than it seems, for it is the bedmakers who wait in hall. Thus, in addition to tips and perquisites, the bedmakers are "remembered" three several times by the pious framer of the Boniface system of accounts. If, in addition to all this, he "daily commits a series of what in a private household would be called petty larcenies," the worthy bedmaker certainly gets on very well, and is a bright example of the working of the "notion" already referred to as co-extensive with the universe of university existence. The summit of a bedmaker's ambition is reached when (as in a case at Merton, vouched for by the writer in *Fraser*) a bedmaker has sold his master's corkscrew to every man on the staircase, including the original owner. The General Expenses already spoken of are apparently not framed solely in the interest of the bedmaker. The junior bursar, too, is remembered, though it is not obvious why the men should pay his salary any more than that of the senior bursar or the Dean of Hall. Can it be possible—the idea occurs irresistibly, merely as a hypothesis—can it be possible that the junior bursar is a bedmaker in disguise? "Water" swells the "General Expenses," though even in lodgings, where you pay for everything possible, water is supplied without extra charge. As to the "other servants," if they are porters and messengers, it would seem that they are paid twice—once by the "gate-bill" and for each message delivered, and once again out of the fund which they share with the bedmakers and the junior bursar. Of all the "General Expenses," only "gas and &c." seem necessary charges. The next item goes beyond the limits of legitimate comedy, and partakes of the character of screaming farce. What does the economical reader suppose is the annual amount paid to the College for dusting carpets and cleaning windows? Why 1*l.* 17*s.* 6*d.* a head, or, at the least, 150*l.* We cannot conceal the gnawing suspicion that the bedmakers dust the carpets, even if they do not clean the windows, which is perhaps too dangerous a service for these ingenious men. One hundred and fifty pounds a year for carpet cleaning! It is like some monstrous Gargantuan item among the charges of an Oxford election agent. The undergraduate, it appears, hires his furniture from the College. We presume that 40*l.* would represent the estimated average value of his tables and chairs and so forth. In some rooms it may be more; in others, 15*l.* would once have been a large purchase money. Now on this sum the undergraduate pays an annual 3*l.* as interest, and 3*l.* more for "depreciation" of furniture when he leaves his rooms. As to these arrangements the writer in *Fraser* remarks that he would like to be the farmer of the Boniface College furniture. But we imagine that the undergraduate is better off now than he was under the old system of "valuations," when he lay at the mercy of a valuator who might take a rosy view of the furniture when he entered, and a morbidly depressed view when he quitted his apartments. As to the charges for local government and poor-rate, the writer in *Fraser* finds that "a popular College in the High Street" must be rated 350*l.* for one or the other. By a popular College we may understand University, as no one can apply the term to the other College in the High. The undergraduate who made the calculations above referred to asked a banker how the College came to be so highly rated, and the banker replied in the words of a vulgar song. What with Mr. Matthews and his 3,000*l.* in a tin box, and what with singing bankers and versatile bedmakers, the "dear city of youth and dream" seems hopelessly corrupt. As to the Boniface General Accounts they are so unlike the spirit of the college, as displayed elsewhere, that we believe the system to have been inherited from the middle ages, and to be due to an inspired bedmaker. The "Tutor" has a good deal to say about the Boniface charges for tuition. The tutors are, perhaps, almost as highly paid as the bedmakers, but we do not see that their services are over-estimated. This is a point on which no one who knows the college would expect a complaint. The tuition at Boniface, to say the least, makes private coaches a needless luxury, and we should be surprised to hear that the undergraduates had any complaint to make on this score. The critic says, "A man may choose to take his degree in a school for which no provision has been made by the college in its scheme of lectures." Then let the man go to Keble, or wherever he finds provision made for his erratic desires. For all that we know he may want to take his degree in the school of Music, and it is not very likely that Boniface will keep, as we think Keble used to do, a piano in the hall.

Leaving the General Accounts, it is plain that there is room for much economy in the kitchen. The price of dinners is much higher at Magdalen and the House than at B. N. C. But the dinners at Magdalen and Christ Church used to be excellent, and at Brasenose they certainly were not deserving of praise. "It is difficult," says the modern Herodotus in the *Oxford Spectator*, "to speak highly enough of the House cook." Now it was not so much difficult as impossible, in ancient

days, to speak in terms sufficiently strong against certain other college cooks. Their dinners were not only execrable, but they were expensive. Dinner was served in "commons," that is, small portions. You ordered, let us say, "saddle of mutton." A raw instalment of tough, pale, elderly lamb was served up. You sent it away, and tried "rissoles." A slab abomination was brought to you, half cold. Shudderingly you commanded "roast chicken" to be provided, and you were regaled with the loin and leg of a huge patriarchal rooster, "the mighty bones of ancient cocks." Finally you got literally no dinner, except bread and butter, and you had to pay some three or four shillings for the various forms of garbage which you were compelled to reject. Possibly, in this case, where the maximum of expense was combined with the minimum of dinner, the college cook was no college servant at all, but a kitchen-farmer. "He is not paid a fixed salary by the College, but he pays himself by what he can make out of the confiding and comparatively helpless undergraduates. And here, we opine, it will be his interest to supply as little for the money as he conveniently can. This he has every encouragement and every facility for doing. He stands in the position of a tradesman with a monopoly and something more besides." For, to put it shortly, hotel dinners at Oxford are bad and expensive, and men are fined by the proctors for feasting in taverns. We cannot but think that the very boat of a college must suffer where the cook farms the kitchen, and the men are fed on stuff that can neither make muscles nor brains.

The Universities are intended to train men in the art of living, as well as in letters and science. Do the economics of the colleges set a very instructive example to lads with every temptation to extravagance?

THE ALPS IN AUTUMN.

ALP LUSGEN, on a bluff of which, overlooking the Aletsch glacier, stands the Bel Alp Hotel, has been favoured during the last fortnight with splendid weather; a deep blue sky by day, and by night "stars keen glancing from the Immensities." We write on October 3, at a height of 7,000 feet above the sea. During the day the temperature has been sometimes very high, during the night occasionally very low. Taken from a small library a day or two ago, and placed in the sun, a Fahrenheit thermometer ran up in seven minutes from 52° to 82°, and ended its expansion at 99°. Our July and August weather would not bear comparison with that of the end of September and the beginning of October. Two travellers clung loyally to the Bel Alp hotel throughout the whole of September; but the great body of tourists had vanished before the really fine weather came. The year has been rather below than above the average fineness; at all events, comparatively little climbing has been accomplished. The Matterhorn, which is seen from this place, has, during the greater part of the summer, been obviously unfit for the mountaineer. Snow on rocks, with the chance of its having been converted into an enamel of ice, is not tempting to the climber. There have been some grand thunderstorms. At an early date we paid a visit to the Eggischhorn. There, on one fine morning which seemed to promise a cloudless day, a small wisp of cloud might be detected curling round that singular tower of erosion which stands out against the sky on a far-off col at the opposite side of the Rhône valley. This tower is a good practical barometer, and when it is clear fair weather may be expected. The attention of the host was drawn to the small cloud, but he thought it meant nothing. That night, however, one of the grandest thunderstorms that we have ever witnessed, accompanied by fierce rain, flashed and rang among the mountains. Subsequently, at Alp Lusgen, we had one specially impressive, and indeed dangerous, storm. There was a rare solidity and brilliancy in the zig-zag bars of lightning. They approached us, coming twice so near that the interval between flash and peal was less than a second. Still there was a sensible interval, but not of silence. It was filled by a loud and grating burr, as if the rocks around us had been suddenly thrown into sonorous vibration. The burr was in each case quenched by a deafening peal, followed by its roll of echoes. The breaking forth of the electricity from the rocks, to join its opposite in the clouds, produced this singular commotion.

For three successive years we have had the opportunity of comparing the autumn atmosphere with that of early summer. They are distinctly different. The evening red of the autumn has more of purple in it than that of June or July. Cloud-banners with tattered edges stretch sometimes from horizon to zenith, and, when flooded with the sunset light, are singularly impressive. They seem to burn as vividly as the brightest strontian flame. Yesterday evening (October 2nd) we had an extremely beautiful form of illumination. Over the Mischabelhörner spread a vast cloud with detached masses floating around it, all suffused with the light of a sun which had already set. The illuminated cloud threw its light against the face of the Weisshorn, which, as regards the sun, was in darkness, causing the snow, which is of extraordinary purity on this side, to blush all over. The Alphubel and the adjacent snow-fields, the whole of the Dom, except its highest tip which was still touched by the direct sunlight, came in for the glow of the cloud overhead. The warming up of the snows by this secondary light was wonderful. The forms of the clouds, and their distribution in space, are different in autumn from what they are in early summer. The cloud-texture, if we may use the term, is softest in autumn, resembling then an atmospheric wool of the finest fibre. The clouds below us, which the inhabitants of Eggen and Platten would call fog, also assume singular arrangements. Sometimes the cloud-surface resembles that of a sea in a state of wild turbulence, showing ridges and peaks and crested billows, with deep, dark hollows between them. Sometimes the surface is as flat and white as a level snow-field; its most striking resemblance to water, clasping the promontories and running into nooks and bays, being then exhibited. By moonlight this cloud-ocean is magical in its beauty. The play of light and shade upon the adjacent glacier; the rolling of the clouds over the cols from the valley of the Rhône, and then in voluminous cascades down the pine-covered slopes; the bars of glory wherewith the sun, escaping through crevices in the mountains, smites the ice; the lifting by lateral illumination of the frozen billows, which, when uniformly shone upon, appear flat and uninteresting, are all sources of surprise and delight. Mr. Liebreich has taught us how much the impressiveness of a statue depends on the mode of lighting it. The shadows of the brows and other prominent parts of the face may be caused to enhance in a wonderful degree the force of the sculpture. Thus it is with the ridges and the *séracs* of the glacier when on one side they are brightly illuminated and on the other are in gloom.

Last year a heavy snowfall occurred on the 26th of September. This year we had our first fall in the middle of the month. The presence of snow vastly enhances the dignity of the smaller mountains. While strolling up one of them a few days ago our attention was arrested by the singular forms of the clouds which rose over the summits dividing Switzerland from Italy. Across the plains of Lombardy, where they produce no turbidity in the air, the humid winds drive onward to the Alps. Partly by the chill of the mountains, partly by its own expansion and that of the air with which it is mixed, and partly by radiation into space, the invisible aqueous vapour is chilled, falling into clouds which roll up the mountains, clear the summits, and, rising higher still, show their grandeur to us residents on the north of the ridge. At all seasons vast cumuli thus form and rise, but never during the early part of the year have we noticed clouds of the shape observed during a recent stroll up the Sparrenhorn. In some places they represented a kind of "negative" of the mountains. From one point in particular, on the summit of a ridge, a thin stem of cloud, dark because shaded, ascended. This stem gradually widened like the shank of a funnel, the divergence at a certain height suddenly augmenting so as to form a perfect likeness of the funnel itself. The cloud also resembled the drawings of waterspouts usually given in books on meteorology. Or, finally, its shape was like that of a cauliflower with long thin stalk and large head. There were two or three other similar clouds, with umbrageous tops. The top of this one, however, was not umbrageous, but smooth, and marked with horizontal flutings, indicating an intermittent and regularly recurrent action in the generation and shaping of the cloud. The whole thing looked rather like a product of mechanism than of the free and capricious air. Perfectly astounding cloud-forms may be artificially produced in an enclosed space by the gyrations of nebulous matter occasioned by variations of temperature. Gyration seemed also to have something to do with the formation of the Alpine cloud just referred to. We can imagine a current of humid air rushing up one of the southern valleys and, on clearing the ridge, assuming, through lack of perfect equilibrium of pressure all round, a vorticose motion in the free air; forming first a stalk of cloud and afterwards a funnel. The horizontal flutings, moreover, might be readily produced by rotation round a vertical axis. Late in the afternoon of the day on which we saw this cloud, eight similar gigantic funnels rose between the Monte Leone and the Weisshorn.

The nights, as already stated, have been sometimes keen and cutting. A cascade adjacent to our dwelling scatters its spray over rocks and grassy banks, and wets to a distance the pebbles surrounding its base. Most of us have seen photographs of Niagara in winter, when the trees and twigs of Luna Island, wetted by the spray, show their surprising enamel and dependent stalactites of ice. We had this effect substantially reproduced here a few days ago—grouped rosettes of ice upon the pebbles, glittering spears and matted fretwork among the grass, and a surprising efflorescence upon the rocks. From a thousand points of reflection, pure white light was sent in dazzling sparkles to the eye; while, where refraction and dispersion occurred, we had the exquisite play of prismatic colours. The Swiss hotel-keepers have reaped a comparatively rich harvest this year. They needed it; for they, like us in England—or rather through sympathy with us in England—suffered much from the depression of late years. Probably our neighbour at the Bel Alp Hotel will find the profits of this year double those of the last. The inflow comes in good time; for he has just built a substantial addition to his house, which will place forty or fifty new beds, and many good rooms, at his disposal.

The season is now clearly over, and its setting has been far more glorious than its dawn. The heather has been beautiful, while the bilberry bushes still clothe the slopes with the most brilliant colours. To-day the atmosphere threatens a change. Curious cloud-trailers sweep along some of the mountains; while others are swathed in a haze which, though deep, does not reach the grandeur of downright mountain gloom. In the vast cauldron below us the clouds are boiling, while through the whole the sun gleams at intervals with intense power. The heat is too sultry for the continuance of fine weather. Towards the end of June the

burghers drove their cattle to the higher Alps; in the middle of September, the grass being all consumed, they moved downwards. They then occupied for a time what they call the "Voralp," which is meadow land, the cows there browsing upon what had sprung up since the last passage of the scythe. Some of the burghers have already taken up their winter quarters in their chief village, Naters, in the valley of the Rhône, and all will do so soon. At twilight a profound loneliness reigns among the hills. The sound of water alone invades the silence which it enhances; while our little lake, with the adjacent rocks and banks mirrored by its motionless surface, is the type of purity and peace.

THE FAMINE COMMISSION ON THE PROGRESS OF INDIA.

THE Indian Famine Commissioners have supplemented their scheme of relief by an elaborate dissertation on those multiform processes of improvement which, for want of a better name, are summarized in Parliamentary Blue-Books as the "Moral and Material Progress" of the country. That such processes are at work in every part of the country, on a vast scale and with continually increasing activity, is a fact which the annual statistics have for years past adequately established; but the special duty of the Famine Commissioners was to examine into their bearing on the condition of the people, and especially of the agricultural classes, who are immediately affected by the vicissitudes of season which, it is now understood, must be accepted as part of the normal conditions of existence in India. The extent of the calamities which those vicissitudes involve has now been approximately gauged. So far as the experience of a century teaches, there are, taking the entire country, two bad years to every seven good ones; the average population affected in each instance is about twenty millions; and the result may accordingly be said to be equivalent to a famine over the whole country nearly twice in a century. Each of the great provinces, except Bengal, is visited with drought at intervals averaging eleven or twelve years, and with famines of exceptional magnitude at intervals of about fifty years. Bengal enjoys far longer periods of immunity, and, except in one or two localities, is wholly exempt from this visitation. Judging from the past, the largest population ever likely to be simultaneously famine-stricken is about thirty millions, and of these 4½ millions will need assistance during the months of greatest distress, and an average of 2½ millions for an entire year. It is easy to understand how great are the administrative difficulties involved in extemporizing so large a system of relief, in guarding against executive shortcomings, imposture, and fraud, and, at the same time, securing that the necessary aid should reach millions of frightened, disheartened, and often demoralized people, scattered over an area of 200,000 or even 300,000 square miles, with few great commercial centres, and only the rudiments of a railway system. It is no secret that on several occasions the horrors of famine have been aggravated by the inability of the officials, in high places and low, to grasp the full gravity of the occasion and to confront with the necessary judgment and calmness the innumerable difficulties of a great emergency. Under the old system, a civilian who stayed long enough in the country had a sort of vested right to the highest employment, and men of the slenderest capacity were wafted to posts where at any crisis their want of power and nerve was certain to involve a disaster. As to this the Commissioners speak with a decorous reserve not unnatural in officials. "The only certain way," they observe, "of avoiding the risk of administrative failure, with consequent discredit to the Government and probable calamity to the people in time of difficulty, is to adopt proved capacity as the sole qualification for official employment." Among other administrative reforms, the Commissioners recommend the abolition of the Madras Board of Revenue, an institution which has long been condemned as an obsolete and useless link in the official chain. They insist on the importance of breaking up the larger districts in Madras, eight of which have an area of 8,000 square miles, and in four cases a population exceeding two millions. Such a charge is of course infinitely too great for any single officer to supervise, and no other explanation need be sought of the disastrous administrative breakdown which the pressure of relief operations produced on more occasions than one during the famine of 1876-77.

Coming to the general question of improved administrative efficiency, the Commissioners suggest several important changes. They advise that the head officials of each district, executive and judicial, should be appointed by selection, instead of, as at present, by the rule of seniority. Officers who, after some years of trial, are ascertained to be "bad bargains," are to be invited to retire on pensions graduated to their length of service. Young magistrates are at as early a date as possible to be relieved of the drudgery of the courts and placed in independent charge of a particular area, so as to learn by personal experience the duties which they will subsequently be called upon to perform on a larger scale. The practice of "marching" through the district, and so personally learning the condition of the people and the especial wants of the country, is to be more rigorously enforced. Provision is to be made for introducing into the service a class of officers highly trained in scientific and practical agriculture, and thus promoting the agricultural development to which India assuredly has to look as a means of future enrichment from the 190 millions of acres now for the most part producing crops less than half of the yield attained by scientific cultivation. Lastly, we are happy to observe that careful consideration has been bestowed on the best means of improving the native service, and attracting to its ranks those members of the native gentry whose position and influence would be of especial value. The native official was altogether neglected in Lord Cornwallis's great measures of reform, and there is reason to think that there is still much room for improvement in this department of the service. The Tehsildar, or head revenue officer, is, next to the Collector, the most important representative of Government, and the pivot on which in each district the whole official wheel revolves. Nothing should be spared which would tend to raise the standard of integrity and ability in this important class of public servants.

Another very important branch of the Commissioners' inquiry is that which is concerned with the relations of the people to the Government as regards taxation, and their relations to the Government and one another as landlords and tenants. The Report deals exhaustively with the incidence of taxation, and will, it may be hoped, put an end to the many wild misrepresentations which have from time to time been made by sensational writers and speakers on Indian topics. Of the 65¼ millions which the Government of India annually receives, 24 millions in no sense represent taxation, being derived, partly from opium, partly from the earnings of public works, and the rest from the gross receipts of departments, such as the Post Office, which are on the whole an expense to the State. Of the remaining 41 millions, 22½ millions are derived from land-revenue, an impost which, as is well known, partakes far more largely of the nature of rent than of revenue, the Government enjoying everywhere an immemorial and unquestioned right to a portion of the profits of the soil. It is satisfactory to know that it in no case exceeds 7½ per cent. of the value of the gross produce, that in Madras it is little over 6 per cent., and in the Punjab 5·6 per cent.; while in Bengal and the Central Provinces it sinks to less than 4 per cent. The other items of taxation bring up the total incidence to 4*s.* per head of the population. Dividing it into classes, and apportioning each tax among the classes who pay it, it may be said generally that the landed class pay, including land revenue, 5*s.* 6*d.* per head; the labourers pay 7*d.* per head on salt, or, assuming a family of three persons, 1*s.* 9*d.*, equivalent to about four days' wages of a man and his wife; the labourers, moreover, contribute more largely than any class to the excise, as they are the principal drug consumers; artisans contribute 2*s.* apiece, or, say, the earnings of five working days; traders, 3*s.* 6*d.* All such calculations are of course extremely rough; but the figures given above appear to prove that over-taxation, at any rate, is not among the crimes of the British Administration. The native Powers usually took at least a half of the produce, and not unfrequently more; the British rulers have reduced the charge to an average of about 5 per cent., and there is now much show of reason in the contention that, were it necessary, the landowners might reasonably be called to contribute more largely than at present to the expenses of the State. The chief blot on Indian taxation is that it falls too heavily on the poor, and leaves many of the wealthy classes wholly untouched. A rich Brahmin, for instance, with a couple of millions in the funds, pays literally no taxation but an infinitesimal charge on the salt which his family consume.

As to land tenures, the Commissioners report that, as regards those portions of the country where the occupants hold directly of the State—that is, the Bombay and Madras Presidencies, and parts of Upper India—there is little room for improvement; the tenure is secure, the rental is fixed for long terms, tenant's improvements cannot be made the ground of enhancement, and the tenant can surrender the whole or any part of his holding at pleasure. Where, however, as in Bengal and the North-Western Provinces, a landlord class intervenes between the Government and the occupant of the soil, the position of things is far less satisfactory; great uncertainty as to the tenant's rights prevails, and it is feared that gross oppression is frequently practised. The attention of the Government has been long directed to the subject, and the recommendations of the Commissioners will no doubt be regarded as an important addition to the mass of material out of which some satisfactory legislation has to be fashioned. It is curious that, though there are certainly not less than six million peasants in Bengal with holdings little larger than the smallest Irish holdings, their troubles and grievances are borne with unbroken silence and in unquestioning submission to the law.

No class of improvements so immediately affects the ability of the population to resist famine as the great schemes of railways and irrigation which have so frequently been topics of controversy between opposite schools of Indian critics. The Famine Commissioners were of course bound to examine the whole subject with minute care, and it is in a high degree satisfactory to learn from so authoritative a quarter that the view frequently urged in these columns is fully borne out by the results, and that the undertakings known as "Productive Public Works" have not only earned an excellent return on the money invested, but have bestowed incalculable blessings on those parts of India in which they have been carried out. The Report gives a summarized history of the scheme from its first inception in 1864, when General Richard Strachey, its originator, suggested it to the Government. It ultimately took the form of a project to expend four millions of borrowed capital per annum, the growing interest on which would be recouped by the constantly increasing earnings of the works. This programme has been successfully realized, with

the result that India has at present 9,000 miles of railway, 8 millions of acres protected by canals, and that in the present year not only is the interest on the capital involved and the expense of maintenance defrayed, but a net profit of over 300,000*l.* has been realized for the State. Of the results to the people the Commissioners give several striking instances, in one of which the crops saved in a single season were worth two-thirds the entire cost of the canals, while in another case three-fourths of the capital were similarly recouped. The success of the experiment is now beyond dispute. Equally reassuring are the results of the railways. Though many of the projects are incomplete, a dividend of 4½ per cent. has been earned in the present year on the entire capital, and a constant increase in the goods and passenger traffic attests a growth of trade which will in a few years place India among the foremost commercial countries of the world. Viewed as an instrument of famine relief, the railways are simply invaluable. Goods can be carried for less than a halfpenny per ton per mile; in other words, a pound of corn can be taken 2,240 miles—from one end of India to another—for less than a halfpenny; and the enormous enhancement of price which is one great incident of famine may be regarded, wherever railway communication is established, as a thing of the past. Twenty thousand miles are, the Commissioners calculate, necessary to render the country safe, and of this nine thousand are complete. The remainder can be constructed at a cost of 60 millions, during the next twenty-five years, at an outlay of 2½ millions per annum, which is the rate hitherto prescribed. When this is accomplished famine, in the sense of an actual absence of food or of its prohibitive cost, will, it is hoped, cease to be one of the anxieties which beset the Indian administrator. What the future of this huge aggregate of humanity may be, it would be rash indeed to speculate; but it is not rash to believe that mechanical contrivances and scientific utilization of the resources of the soil will rescue the population of India, as the more civilized nations of Europe have already been rescued, from one appalling form of misery. General Strachey, to whom more than to any other one man the public works of India are owing, may be congratulated on having lived long enough to see the dreams of his youth transformed into solid realities. The present Report will, we believe, be recognized as not among the least of the long list of admirable services which he has rendered to the Government and the country.

POPULARITY.

When men are not engaged in making money they are generally endeavouring to acquire popularity. It has often been said that to die rich is the chief aim and object of a vast number of lives, but we suspect that even more lives are spent in seeking the prize of popularity. An essay on popularity in the abstract would fill a volume, and within our limits it would be impossible to do justice to such a subject; but we propose to notice a few of the characteristics of popularity and its opposite in some particular cases.

There are few greater mistakes than the supposition that rich or great men are certain to be popular. It is of course true that rich men of high position have usually great opportunities of becoming popular; but, on the other hand, the higher a man's position and the greater his wealth, the greater opportunities has he of becoming intensely unpopular. A poor man could not possibly attain the notorious unpopularity for which some men of high rank and great wealth are remarkable. We have often heard people, when abusing a peer, conclude by observing "And you know it takes a great deal to make a lord unpopular." Now, although we are not prepared to dissent altogether from this opinion, we maintain that a lord is consigned to the lowest depths of unpopularity on slighter pretexts than a commoner; and while we allow that it is easy for a commoner to become a little unpopular, we must add that it is easier for a peer to become excessively unpopular. Everybody must have observed the extreme and somewhat anomalous unpopularity of unpopular peers; and perhaps it is not too much to say that a hated nobleman is one of the most hated beings on the face of the earth. This may be perhaps a cringing world and a toadying world; but it expects a great deal from its best-favoured children, and resents without pity any neglect of what it considers the duties of their position. The marquess or duke who is of a quiet and sedentary disposition, whose greatest enjoyment is reading, and whose favourite recreation is the pursuit of rare insects, is scarcely likely to take much trouble about filling his houses for shooting-parties or balls. In London the society which gives him the greatest pleasure is that of scientific and literary men. It cannot, therefore, be a matter of wonder that "drums" are hardly to his taste. A morning at Woolwich Arsenal or a manufactory would be a pleasure to him, but Rotten Row would bore him immeasurably. He innocently imagines that, if he builds some new farms and drains many acres of land, he is spending enough money in his county, and he takes care to be liberal in his subscriptions to charitable objects. If his personal expenditure is lower than that of his predecessors, he saves a large sum of money for his successors, and lays out more upon his estates than any of his forerunners. Although he is shy and retiring, his influence materially assists several learned and charitable societies; and he writes a book which brings in a profit for which many a poorer writer would be extremely thankful; while his paintings have not the peculiar merit claimed by a valet for those of his master, that "any one could see that they were not done by one of them chaps that are paid for it." On the bench his opinion often varies from those of other magistrates, and when he thinks he is in the right he refuses to give way without a struggle. He finds out that some of his most neglected country neighbours have more in them than others who are better known, and he shows them attention accordingly. Being fond of flowers and the beauties of nature, he occasionally spends May and June in the country; and, disliking dreary weather and caring little for field sports, he is rarely at either of his country houses between November and April. Most people will agree with us that a nobleman of this type is extremely unpopular. Here is his portrait as painted by his neighbours and compeers. He neglects the duties of his position; it is a pity he does this, and a pity that he does not do the other; he is a prig; he is letting the county go to the devil; and he only associates with barristers, professional authors, priests, and parsons. Borethem Castle is a very different place from what it used to be; instead of being the pleasantest house in the county, it is now usually empty, and when occupied it is full of people whom none of the neighbours would care to meet. Instead of being friendly to "the right people," its owner has taken up some of the "oddest families" in the neighbourhood. He is a crack-brained magistrate, and makes himself a perfect nuisance on the bench. Instead of hunting or shooting, he pokes about the lanes with a butterfly-net and a japanned tin-box, like a schoolboy or a German student, and somebody has even seen him wearing a pair of blue spectacles. He never goes to church, and he believes in nothing; he is a Roman Catholic or a freethinker, and for all his quiet, inoffensive manner, he indulges in drinking or ritualism in private. His tastes are un-English, and he spends his whole day in playing the harmonium, instead of attending to his estates and entertaining guests; he sleeps by day, and reads throughout the night; he became entangled in a love affair at St. Petersburg, or Constantinople, or Gibraltar, which made him shun women ever after, and he has a legally married Hindu wife and a large family in India. His only pleasure is to work like a common blacksmith at Woolwich or Birmingham, and it has even been rumoured that he occasionally retires to a private lunatic asylum. He has done untold harm by building over-luxurious farms, and by raising the price of labour in his county; he is a mean screw, and he fools away immense sums of money with nothing to show for them. In fine, instead of having availed himself of the magnificent opportunities of his great position, he is the most unpopular man in his county, and his name is scarcely ever heard of in London. So much for the verdict of the world in general. The common feeling about the man is "Why cumbereth he the ground?" He will be remembered as the unpopular duke, and at his death the "society" papers will contain short paragraphs describing his eccentricities. Now we are not prepared to say that such a man would be popular in any position of life, but as an ordinary person he would in all probability be treated with indifference. As a nobleman, however, he is looked upon as a public enemy and a sort of social criminal. There may be scientific and literary sets among which he is esteemed and liked, and there may be many a poor cottage in which his name is ever mentioned with gratitude. He may have a considerable number of real friends, which are, and always have been, rare things; and he may be more loved than any other man in his county. But all this does not constitute popularity in the proper sense of the word. A popular man may not have a single real friend, and it is quite possible to be a universal favourite without being loved by any one. For the popularity of a man of high degree, good works, moral character, and a charitable disposition are far less important than an accurate pronunciation of the Shibboleths of his position.

While demonstrating the facility with which a great man—great in the sense of wealth and position—can acquire unpopularity, we willingly allow that he may easily obtain popularity if his inclinations dispose him towards the amusements which the world considers suitable to his position. We believe it may be safely said that the popularity of a rich man of high rank depends to a great extent upon the nature of his pleasures. We will suppose the case of a man who lives the approved life of a British magnate. He has a well-turned-out coach on which he appears constantly in the Park. He keeps an excellent man-cook, and his wines are of the finest vintages. His face is familiar at the best clubs and at the most select parties. His balls are among the most brilliant of the London season. He is the owner of a Derby favourite, and his yacht is one of the finest afloat. He keep the hounds in his county, or at any rate he pays the largest share of their expenses. He has fifteen hunters and many hacks, from smart horses suitable for the Park to shooting ponies. He rears several thousand tame pheasants annually, and he imports litters of foxes for his gorses from Wales and Scotland. His deer forest is one of the finest in the kingdom, and his salmon rivers and moors are unsurpassed. During the winter months his castle is frequently filled with people of title as well as his country neighbours and relatives. It is highly conducive to a man's popularity among little people to have his house often filled with what the latter term "swells." It gives some people great pleasure to jostle against lords in the hunting-field, and a chance word with a peer at the cover-side or at a check in a run will make them happy for a month. They can veraciously say for ever after that they have "met and spoken with" the Marquess

of Pimlico, and they will inform all their acquaintances in a casual manner that Lord Whitehall once made such and such an observation to them. The man who turns loose half-a-dozen of these charming beings into the hunting-field at intervals during the season is looked upon as a public benefactor; and there are many sportsmen to whom "the party from the castle" is a far greater object of interest than the hounds or the fox. As regards the charities of the subject of our sketch, they amount to about a tithe of those of the unpopular man whom we described above, and he lays out less than half the amount annually spent on estate improvements by the latter; but he keeps up his reputation for judicious liberality by some munificence to the favourite charities of the parsons most approved by good society both in London and in the country, and he establishes his fame as an agriculturist by a herd of expensive shorthorns at his home-farm. Such a man, provided he is tolerably good-natured and good-looking, is almost certain to be popular.

Great wealth and high position are nevertheless by no means essential for popularity. With the comparatively poor man, again, his amusements have an all-important bearing on his popularity. He should be fond of shooting and shoot well; he should like hunting and be able to ride well upon all sorts of hunters, whether agreeable mounts or the contrary; and, of all things, it is important that he should be fond of dancing and dance well. It is desirable that he should like good living, and be able to do full justice to good dinners and good wines; and he ought to be fond of gossip, and be a collector and judicious distributor of good stories and choice bits of scandal. Above all, he must say ill-natured things to each of his patrons about their special enemies, and encourage them in their favourite sins and eccentricities.

It may possibly be considered that our portraits of popular men are neither edifying nor attractive; but we are quite ready to admit that among the very salt of the earth popular men are occasionally to be met with. Large-heartedness and love of one's neighbour will make their way if consistently acted upon; but unfortunately irreproachable people are too apt to forget to love the sinner while they hate his sin. Many monks and nuns of great austerity have been famed for their popularity; and it is observable that ecclesiastics of unusual personal mortification sometimes are, and have been throughout history, specially popular among gay men of the world. On the Continent members of the ascetic religious orders are far more popular as confessors with fashionable people of the world than secular priests. Some men are naturally of such a sympathetic nature that they can scarcely help being popular; others become popular through force of circumstances, and a few school themselves to such kind feeling towards others that they win popularity. An essayist on this subject might with good reason treat the question of the value of popularity when gained; but on this point we prefer to be silent.

SCOTCH SALMON-FISHING.

ROD salmon-fishing in Scotland has ended for this season, and with results that can hardly be called satisfactory. There was fair promise of sport at the beginning, and anglers were proportionally jubilant. But they had counted on rains which never came, or came only in occasional showers. The fish were stopped on their way to the upper streams; those that remained in the pools whence their further advance was obstructed are said to have suffered severely from disease; while there was little or no use in casting over clear waters that had been shrinking in the continuous drought. And nothing perhaps is more thoroughly disappointing than a bad season for salmon-fishing. In shooting, unless in the case of a moor that has been swept by the grouse epidemic, there is always something to be done. By perseverance and hard walking you are pretty sure to pick up some birds; and in any case one has always the pleasures of hope. So it is in fox-hunting. Cover after cover may be drawn blank; the scent may be bad or the frost may be exasperating; but by the coverside you are ever looking for the fox to break away, and you know that a run of some kind must come to you sooner or later. This may be in some degree the case even with the salmon-fisher who lives quietly at home, and takes his sport on his own stretch of river. He can afford to possess his soul in patience while following his ordinary vocations and waiting for the turn of the weather. Morning after morning he jumps up from his couch to see the heavens still bound in brass or coming down in waterspouts, as the case may be. Nevertheless the day must arrive at last when the keeper will warn him that "the water is in fine condition for the fish," and then it must be his own fault if he does not improve his opportunities. But Highland chiefs or Lowland lairds with pretty reaches of rapid salmon stream are comparatively few. The great majority of salmon-fishers rent their piece of river for a season, or journey Northward on a flying visit to some friend. Either way, they are gone to Scotland with a purpose, and their thoughts and energies are concentrated on that purpose alone. Their hearts have been in the Highlands among the salmon and grilse for weeks past. They have been recalling the incidents of former successes or failures, and conjuring up the scenes of future triumphs. Their fly-books have been methodically overhauled and liberally replenished; with gaudy lures for the greater rivers or more sober flies for the smaller streams. Their creels and the points of their cleeks have been seen to. Their rods have been examined and packed away in the cases, and the cases have been carefully deposited in the luggage-van at Euston Station or King's Cross. The traveller who may be bound for Berwick, Perth, or Fochabers—for Tweed, Tay or Spey, or anywhere betwixt or beyond these rivers—dozes away after dining into pleasant dreams, looking forward to a joyous awakening. The Saturday reports in the weekly sporting journals, as well as the latest private despatches, gave somewhat rose-coloured accounts of the state of the rivers. There had been some scarcity of water, to be sure, but as the weather had been decidedly dry for the season, a sufficiency of rain might be confidently expected. As the traveller on his way to his fishing quarters paces the platform at the railway junction, or lounges at the door of the inn while they are putting horses to a vehicle for him, he questions acquaintances or bystanders as to the fishing prospects. He stills the throbbing of his heart as he puts the question, and waits for the answer with affected indifference. Nor does he hear anything that need greatly disquiet him. The rivers would be the better of rain, that is universally admitted; but Mr. So and So and such another gentleman's keeper killed heavy fish no longer ago than yesterday. Arrived at his quarters, he sends straightway for his own keeper or boatman. Sandy, or Donald, scratches his head, falls back upon his snuff mull, and hesitates in his speech, clearly divided between the desire to be agreeable and the doubt whether it is not better to make preparation for the worst. The river was in grand ply, to be sure, as late as Wednesday, or may be Tuesday. "Fish? oh, ay, there are no want of fish, if so be that ane only could get them—but—." In fact, it appears on cross-examination that the river has been falling steadily; that "there will not be that much to be done till we get the rain"; but that, in the meantime, "it may be worth while trying it the morn."

The fisherman does make the trial on the morrow, and fails miserably. It is no comfort to him to admire the reflection of rock and foliage on the rippling surface of the stream, to look down through the limpid waters to the river-weed streaming from the boulders embedded in the bright gravel. The best pools and surest casts may be deep enough to keep the secrets of their bottoms; but it is certain that, if salmon are there, there is no stirring them. The few clouds have cleared away before the ascending sun, and the heavens are painfully radiant. It becomes hard work casting with the heavy reel, as aching arms and shoulders begin to warn you; nor is it in human nature to continue to throw carefully when you have abandoned all reasonable hope of a rise. You welcome the suggestion of an interlude for a light refection, and recruit sinking nature from the flask and tobacco-pouch. But how different is the lounging siesta in the shade from what it might have been had the silver-scaled salmon been glistening in front of you. And when it is over you are demoralized instead of being invigorated; the afternoon goes listlessly by in half-hearted efforts, and you return homewards, feeling that it has been sadly misspent. So day succeeds to day, your hopes sinking with the river till they have subsided into sullen despair. It is more than idle to put up the rod, and you fall back upon all sorts of desperate resources for killing time, if you do not resolve on precipitate departure. And even the long-expected rain may only come to tantalize you. While it is falling, and for a little time after, the brown and foaming flood is of course altogether unfishable. Then for a while it is in excellent order, and you may be more or less lucky in your sport. But only too soon succeeds the change for the worse. Improved farming and scientific subsoil-draining have done irreparable injury to many of the salmon rivers. Where they still flow chiefly through Highland glens, through woods and heather and unreclaimed peat mosses, the water soaks away to the natural old-fashioned channels of hill torrents fed by the mountain rains. Accordingly, before the effects of the rainfall have disappeared, there is a fair chance of your seeing the beginnings of another. The salmon are shifting about in the subsiding stream, and are ready enough to rise to the lure. But in the river that runs through fertile "haughs" and rich agricultural land the case is very different. Each drain comes down in flood, collecting the rainfall between a couple of furrows, and in the course of four-and-twenty hours the ground has been dried like a squeezed sponge; while the sudden overflow has swept down the river to the sea, leaving the streams and pools nearly as shallow as before.

After so sad an experience as a blank sojourn in the North, you feel more than half inclined to forswear salmon-fishing; but that inclination is as transient as the mood of disgust. You have far too lively a remembrance of the pleasures of a sport which grows upon its votaries with advancing years, till in a good old age it has become a confirmed habit that makes a hard fight of it with gout and rheumatism. Outsiders would be disposed to pity the elderly gentleman, with stooping shoulders swathed in a plaid and shrunken limbs enveloped in homespun and lamb's-wool, who is bending his steps towards his boat on the Tweed, when there is more than a "sough" of winter in the air, and when sleet and hailstorms are driving on the blast. It strikes them that he would be infinitely better off comfortably ensconced in a snug armchair in the chimney corner, reading his Scrope or Colquhoun, and indulging in his salmon-fishing through the fancy. But, if he did not enjoy himself, do they imagine he would be here? For, after all, the force of habit is not everything. And, though he appears to be wantonly provoking a rheumatic attack, even from a sanitary point of view he may possibly be right. The bracing exposure and the healthful excitement may give a general fillip to the failing system. As for excitement, see him by and by, grappled

fast to an eighteen-pounder. The fish newly arrived from his ocean cruising-grounds, having shot the arches of Berwick Bridge but the day before, is sheathed in a coating of glistening sea lice. He is strong of body as a young hippopotamus, and as strong in his resolution to break away. It is fortunate that the tackle is sound, though light; otherwise even the veteran's skill might be foiled by the scientific strategy taught to the creature by infallible instinct. There is many an alarm as the line will hang loose now and then, after one of the impetuous rushes of the fish; for a moment he had been given up for as good as gone, when he actually had made a dash under the bottom of the boat. But when the struggle has ended, to the disadvantage of the gallant salmon, the captor looks younger by half-a-dozen years than he did before. Should that be the sole achievement of his trip, it was worth while making the journey from London on purpose. And if the fires of youth rekindle and live again in the ashes of old age, what must salmon-fishing be to the enthusiast in the prime of strength and skill? Then, as we imagine him, the salmon-fisher would for choice eschew a boat, magnificent as are the captures to be made in the Tweed. He is to be found setting up his rod on the banks of some Highland stream, where one may easily cast from side to side as it narrows between rocks and shelving shores. It runs fast under its woods in alternate rushes and twists. Here and there it tumbles down rocky ledges, and often at some sharp angle in its course there is no passage even for the roe deer along the shore. You must be ready to wade at a moment's notice, and not unfrequently to swim. It is then, with a lively fish upon the line, that one is initiated in the sensational mysteries of "salmon jumps." It needs strength and agility, as well as skill, merely to keep a footing on the shifting pebbles of the bottom, with the river flowing swiftly round you up to the waist, and one of the arms fully occupied in steadying yourself. Meantime, the other arm has been given over to the management of a formidable rod, with a salmon at the end of the line that is doing his utmost to "break you." Broken from time to time you no doubt will be, but it is strange how comparatively seldom that catastrophe will happen when a well-hooked fish is played by practised hands; while of course the sense of triumph is proportionate to the delightful difficulties you have managed to surmount by the combination of skill and strength, agility, promptitude, and presence of mind.

FAMILY BURIAL-PLACES.

A QUESTION has already arisen upon the working of the new Burials Act which no one who has given a thought to English habits or feelings will regard as merely incidental. The Act makes no provision for the case of burial of non-parishioners, and the status of a parishioner is only acquired, strictly speaking, by residence or by payment of rates. Such an omission can hardly be supposed to have been unintentional, and in fact it was, we believe, designed. It is understood that interference with, or extension of, what may be described as the civil right of burial was not considered to fall within the immediate scope of the Act. If this view be correct, the contention of the relatives of a deceased person in a case reported from Cumberland, that the Act covers the customary right of non-parishioners, and overrides the discretion of the incumbent upon the general question as to permission for their burial, must fall to the ground. If, as has always been admitted, the absolute right of giving or withholding such permission rests with the incumbent, it is evident that he may impose his own conditions for granting it. The question as to a Nonconformist service was therefore certain to arise sooner or later, and it was in every way desirable that the issue should be raised at once. The Vicar of Walton appears to have acted with both firmness and courtesy in meeting it. We do not now propose to enter any further into its discussion, our object in referring to the case being simply in view of the traditions of custom and feeling out of which it springs. The desire that the members of a family in its successive generations should share a common place of burial is historical and universal. "He was buried with his fathers" is an ancient memory of blessing and peace as much as "Thy carcase shall not come to the sepulchre of thy fathers" was a penal sentence and almost a curse. Only the chief who is strong enough or famous enough to rely on himself, and who makes a fresh departure as the founder of a family or a dynasty, forsakes the hereditary tombs and builds a sepulchre of his own into which his descendants shall be gathered to him. "The possession of a burying-place" is an accompaniment of the possession of the land, and the English custom has beyond doubt become rooted in the tenure of land under its various forms. More immediately, the family vault in England may be an outcome of the chantry or mortuary chapel. The bodies of the dead would naturally lie together where the priest endowed by the founder of the chapel would say his perpetual mass "pro animabus supradictis," as well as for the good estate of the living members of the family. From the "Domus ultima" which—not, indeed, in pre-Reformation times—indicated the lordly vault of sepulture till the well-known and bitter epigram shamed the words out of a southern Cathedral, the tradition found its way down to the (possibly uncoffined) dead of the country churchyard, and the parish sexton left a vacant space by the grave where the husbandman lay "buried in woollen," that wife, or son, or daughter might in due time be laid by his side. In every village, and in every family where it was possible to bear the dead for burial to the accustomed place, the practice prevailed; and in families of the middle class long and costly journeys were common in the days before railways, so that the hearse might bring the dead to repose in the family vault.

A custom so deeply rooted in English feeling and tradition necessarily obtained recognition in the series of Burial Acts hitherto so called, which have been measures of sanitary legislation. The prohibition of more than a single interment in each grave has been relaxed in favour of the "family grave," which may be dug to as great a depth as the nature of the soil will safely permit, and which may be filled within a specified distance from the surface, subject only to the condition that a layer of earth of regulated thickness must be left undisturbed on each coffin. This last provision requires some watchfulness to enforce, not on the mere ground of a sordid economy, but in consequence of the frequent desire of mourners to look on the last buried coffin when the grave is again opened. Such a desire, however strange it may seem to an uninterested observer, had existed in sufficient strength through the community to establish, and to maintain till the necessary provision of law put an end to it, the practice of burial in open crypts or in undivided subterranean chambers, in which at each burial all the other coffins (now enclosed in masonry) were exposed to view. To what extent this practice was carried will be remembered by those who have seen the public vaults—so called to distinguish them from private enclosures—underneath some churches in London and elsewhere. In these cases the feeling was met and counteracted by a yet stronger feeling which supported the intervention of law. But in the ordinary operation of the Acts which closed our crowded City graveyards, exceptions were specially made in favour of the widespread affection for places of family burial. When the burial-ground of a populous metropolitan parish had been closed, it was obviously impossible to allow the general interment of its dead in the churchyards still left open in adjoining parishes, and such burial was therefore forbidden within the London district, save only in cases where a relative was already buried in the open churchyard; and the exception was not confined to "family graves," but extended to ordinary burials. It will be seen that this exception did not confer the civil right of burial, but only allowed the incumbent's power of permission, otherwise cancelled, to remain open. At the same time it admitted the claim of an existing custom to some recognition by law. Whether in the "Burial Laws Amendment Act" of the past Session—which, under a similar name, is distinct in nature—any such recognition would have been desirable or possible it is not within the scope of the present article to inquire. We are now only concerned with the traditional sentiment, of which the force as well as the tenderness does not admit any question, but which in our present social condition has already become, and is increasingly becoming, the luxury of the few. Within the narrowing limits in which alone it can be maintained is it worth maintaining? It is probable that as regards the great majority of our London population, and of that of all our principal centres, the hereditary character of this feeling is already extinguished. No tradition attaches to Kensal Green or Highgate, and probably no tradition will ever take root there. The husband and wife may desire to be laid there together, and the parent with the lost child; but not, we think, the son with the father when a generation has passed by. The cemetery, notwithstanding the beautiful association of its name with Christian antiquity, is a necropolis in the actual thought of men; and it is an English feeling which that most English of Americans, Bishop Cleveland Coxe, long since expressed in very plain words:—"I never loved cities of living men, and towns of the dead I hate."

It is not so clearly apparent, but it is still very questionable, whether in smaller communities the tradition of a family burial-place can survive the substitution of the cemetery and the Burial Board for the churchyard. The separation of a mile or two within the limits of the same parish may matter little or nothing as regards the living home, but it distinctly breaks the bond of association in the home of the dead. It is perhaps not possible, as it certainly is not easy, to distinguish between the religious or ecclesiastical and the personal or local threads in the texture of such association; but we are inclined to think that this sense of breach or separation is not in any way attributable to influences which may be classed under the first of these heads. And even where the old place of burial remains exactly the same, the gradual delocalization of families must inevitably tend to break up the force of the traditional feeling. It happens not unfrequently in manufacturing districts or increasing towns that no member of a family which has for generations been buried in the parish churchyard continues to live in the place or neighbourhood. The tendency of modern trade is to drift in a second or third generation into professional or other lines of life, and the family which in the seventeenth and eighteenth centuries never moved beyond the limits of its local ring-fence is now scattered all over the world. In instances where the means of communication are comparatively easy, the traditions of a family gathering at an English funeral are rudely set aside when the place of meeting and point of departure must be the railway station, or at best a private room in the principal hotel. The old accompaniments of drawn blinds and closed shutters along the way, not unmeaning since they were kindly meant, are of course absent; and it is not unlikely that the head of the family, who had

been at the pains to secure a vested interest before the Order in Council had issued, may have found an officious sexton in the churchyard a few days earlier, to point out to him his own grave as a curiosity of the place, "because there isn't no one in it." Local memories in the present day are remarkably fleeting, for the manifest reason that public events furnish the subjects of thought and conversation which the traditions and associations of the neighbourhood formerly supplied. "In memoriam" is now little beyond a formula; the only reality is "Hic jacet." We have no intention of implying that this fading away and dying out of memories is a new phenomenon of our time. On the base of a shattered and crumbling shaft from which Puritan vandalism had destroyed every vestige of the fourteenth-century cross, the inscription is said to have remained as matter for later tradition—

> Qui meat huc [ploret] signumque salutis adoret,
> Utque sibi detur, veniam De Someri precetur—

when all other traces of the old lords of the manor had utterly passed away. But the process is, notwithstanding, more rapid than this gradual effacement and decay of earlier days. Probably De Someri was in some sense a reality of memory so long as any chantry priest remained to pass by the Churchyard Cross on his way to the altar within.

It may, we think, be anticipated that the family burial-place will pass away from English use; but its traditions will not the less survive, and there are signs sufficient to show that its survival will assume a very ancient form. It will be a place, not of burial, but of pilgrimage. The pilgrim, and notably the American pilgrim, is already a familiar, and we need not add a most welcome, visitor in remote country parishes, and the battered effigy to which time had left no features, and mischief not much of limbs, proves to be a veritable idol to its initiated worshipper. Whispers are heard besides, rising sometimes into murmurs, which suggest that to the pilgrim of a coming age the Church restorers and architects of the present century may appear as possessed with an iconoclastic fury, and Hanoverian marbles may become as precious a treasure as the domestic bricks of Queen Anne now are. There will, we may be assured, be no loss of reverence for the past, and no diminution of what is strictly meant by filial piety, although the custom which has held fast by family burying-places may become entirely obsolete, and although in this as in other respects the direction of the manner of interment may pass under the control of the law.

THE THEATRES.

THE amended version of Douglas Jerrold's play of *Black-Eyed Susan*, which has been successfully produced at the St. James's Theatre, and the two changes which Miss Ward has insisted upon introducing into Messrs. Merivale and Grove's admirable drama of *Forget Me Not*, serve together to raise one or two interesting questions concerning the relative rights of authors and managers. The latter proceeding, as might have been expected, has led to some lively controversy. The claim of an actor or a manager to alter the form of a play so as to suit his own notions of what is fitting or convenient has been stoutly contested by Mr. Merivale, and is likely to form the subject of a legal decision. In the meantime, however, both parties have laid their views before the public, nor has the claim put forward by Mr. Merivale lacked the support of other distinguished writers for the stage. Indeed, if it were not that Miss Ward and her managers seem to be so genuinely convinced of the righteousness of their cause, the point could scarcely be held to admit of argument. No stranger theory, surely, was ever put forward than that which Mr. Edgar Bruce has undertaken to defend. According to his contention, a manager's obligations to an author are altogether insignificant as compared with the duty that he owes to the public. Mr. Bruce appears to be scarcely able to speak with patience of Mr. Merivale's claim on behalf of authors that they should be allowed to be the arbiters of their own fortunes, and he rather assumes that the writers of *Forget Me Not* ought to be infinitely obliged to himself and Miss Ward for having had the courage to introduce a change which has been heartily approved by the "press and the public." But, as Mr. Gilbert aptly points out in a letter to the *Times*, "No man is bound to have his fortune made for him against his will." Whether the change that has been made affects the play for better or for worse is really quite beside the question. It is, of course, conceivable that Mr. Bruce and Miss Ward may know more about dramatic writing than Mr. Grove and Mr. Merivale; but this, if true, only goes to prove that they would have done better to have written a play for themselves than to waste their abilities in altering the work of others. And, as a matter of fact, this benevolent theory of Mr. Bruce's utterly fails to fit with the circumstances of the present case. Even admitting the right of a manager to hack and hew a literary composition to any deformed shape he pleases, so long as he can secure the approbation of "the press and the public," there is here absolutely no evidence of any need for improvement. The play which has been forcibly altered against the authors' will had enjoyed a long and successful career in its original shape. The approval of the "press and the public," by which Mr. Bruce sets so much store, was long ago accorded to the performance, and therefore Messrs. Merivale and Grove cannot be said to have been deserving objects of that benevolent process of reform which Mr. Bruce has insisted upon extending to them. But, even Mr. Bruce's benevolence is more plausible than Miss Ward's bold assertion of the indefeasible right of an actress to alter a drama in any way she may think fit. Having purchased the acting right of *Forget Me Not* for a term of years, Miss Ward assumes that the authors of the piece have no further concern with the use she may choose to make of her property. She likens her position to that of a tenant of a house who can make any alteration he pleases, so long as he undertakes at the expiration of his lease to restore the structure in the form in which he received it; and she blandly reminds Mr. Merivale that he and Mr. Grove will be at perfect liberty to reinstate the character she has expunged so soon as her period of occupation shall have expired. A more grotesque and misleading illustration of the scope and limitation of an author's rights was surely never attempted. If Miss Ward's views are correct, it would be justifiable, as it would certainly be easy, for an actor with only a year's interest in a play to ruin it altogether. The changes introduced would only need to be sufficiently ludicrous in order to give the public a final disgust for the author's work, and when by this means his reputation had been ruined, the liberty to revive the piece in its original form would seem but an empty consolation. The line of argument used by Miss Ward would indeed, if pushed to its logical conclusions, put an end to an author's right of control in every kind of literary property. A publisher endowed either with the benevolence of the manager or with the confidence of the actress would feel himself entirely justified in expunging one of the characters from a successful novel; and, if the novelist was so testy as to object to the change, it would be only necessary to remind him of his contingent rights in a future edition of his work to be issued by some other firm.

The justification of the course taken by Messrs. Hare and Kendal in regard to *Black-Eyed Susan* seems to us to rest upon widely different considerations. In this case the author is no longer alive, and cannot therefore be consulted upon the proposed changes in his work. He would, it may fairly be assumed, have been as sensible as the managers of the need of modifying his original conception in order to fit it to the altered requirements of the time; and to abandon the revival of a spirited play merely because the author is no longer at hand to make these necessary changes would, we think, indicate very little real respect for his memory. The managers of the St. James's Theatre have shown a truer appreciation of the worth of Jerrold's art in saving so much of the original piece as could be fairly presented to a modern audience, and in employing a writer of the taste and talent of Mr. Wills to reconstruct the remainder. For no one who has either seen or read the play as Jerrold left it can suppose for a moment that it could have been successfully revived in its unamended form. The closing scenes, which are still kept intact, are no doubt admirable of their kind, though even here the artifices of style sometimes painfully conflict with the pathos of the story and the simplicity of the characters. But in the earlier portions of the play these faults of literary taste present themselves in an exaggerated form, and are the more obtrusively apparent from the fact that the action of the piece is here feeble and incoherent. The affectation of nautical phraseology is carried to the point of absolute burlesque. When one of the performers is about to tell his story he promises that it shall be short—"short as a marlinspike." When William, just newly arrived from his ship, sees his wife approaching, he apostrophizes her in this highly natural and idiomatic strain:—"There's my Susan! Now pipe all hands for a royal salute. There she is—schooner-rigged. I'd swear to her canvas from a whole fleet. Now she makes more sail! outs with her studding booms! mounts her royals! moon-rakers and sky-scrapers; now she lies to!" And yet this unsophisticated sailor, whose dialect is thus rigidly limited by the circumstances of his calling, has only a moment before ventured an expression of a feeling that he is "driving before the gale of pleasure for the haven of joy." Indeed, the occasional lapses into sentiment are even more disastrous than the strange jargon which the author put into the mouths of the sailors. Susan, who is supposed to be the wife of a common seaman, thus replies to some base insinuation made by her old uncle:—"Sir, scorn has no word, contempt no voice, to speak my loathing of your insinuations. Take, sir, all that is here; satisfy your avarice—but dare not indulge your malice at the cost of one who has now nothing left her in her misery but the sweet consciousness of virtue."

It will be seen from these quotations that some kind of reconstruction was absolutely indispensable in order to fit the play for modern representation. This being so, the course adopted by Mr. Wills was perhaps, upon the whole, the wisest that could have been taken. He has made no attempt to tinker Douglas Jerrold's work by the introduction of new material. He has simply put aside entirely all the earlier portions of the play, and has devised for himself a new series of scenes to lead up to the final catastrophe. This is not merely more respectful to the elder writer's reputation, but it is infinitely more satisfactory to the audience. We have now a connected story wherein the fortunes of William and Susan are constantly kept in view, and we are spared a mass of irrelevant matter which to the more exacting taste of our time would be scarcely tolerable. It has been urged as an objection to the two new acts supplied by Mr. Wills that they are too completely dominated by a sentiment of melancholy, and that the pathetic

force of the final situation is thus injured by anticipation. But in reality the criticism applies with greater force to the drama as it was left by Jerrold than to the altered version of the modern writer. In the original play there is no counterpart to the happy picture of Susan's home that is now presented to us. There the scene opens with every circumstance of distress. The old dame with whom Susan lives is near to death, and all the furniture of the little cottage is about to be seized for rent. Her uncle is plotting her ruin, while a smuggler bearing the ill-omened name of Hatchet seeks, by a lying story of her husband's death, to force her into a marriage with himself. Mr. Wills has in reality sought to soften the rough outline of the picture. He has set his heroine in happier surroundings, and has led up with more delicate art to the climax of the story. It is true that he has introduced a pathetic incident into the first act which is not to be found at all in the earlier version, but this is only indirectly connected with the fortunes of the principal characters, and it forms in its present position one of the most effective passages of the play.

One of the things most remarkable in the representation of *William and Susan* is the careful completeness of the stage management. This is everywhere apparent; but it is especially noticeable in the conduct of the second act, where the sustained gaiety of the sailors and their wives and sweethearts is absolutely infectious. We have rarely seen a dance upon the stage acted with such a convincing impression of enjoyment to those concerned in it; and indeed the whole of this scene, including the sinister incident which brings it to a close, may be reckoned a triumph of skilful arrangement aptly carried out. In the second act, also, occurs some of the best acting of the evening. Mrs. Kendal is admirably suited in the character of Susan. The display of high animal spirits, combined with the occasional expression of strong and simple pathos, comes naturally within the range of her art, and nothing could have been more effective or less strained than the sudden transition from the jollity of the dance to the grief at the unexpected news of her husband's departure. There were two passages in her performance which especially revealed the excellence of her art. The first is where she is about to plead with the Admiral for William's discharge, and is unwillingly brought to silence by her husband's reproving admonitions; and the second is the actual leave-taking when William is summoned to the ship and is following his companions to the shore. While he is still in sight her face keeps some semblance of a smile to cheer him on his way, but when he is actually gone a shadow falls suddenly upon her face, the hand that has been waving to him hangs listlessly by her side, and she sinks into an attitude of dull despair. Mr. Kendal's representation of the sailor will surprise those playgoers who know him only in the heroes of genteel comedy. He is not perhaps ideally fitted for such a part as William, nor is it possible that he should be able to satisfy all the requirements of the character by the mere processes of art. Art cannot give what nature has refused, and if nature had endowed Mr. Kendal with the kind of robust personality which we instinctively demand in the heroes of nautical drama, he would never have achieved his earlier successes in a different line. But Mr. Kendal's performance shows at least that, as far as the artist in him is concerned, he perfectly understands what is required. From the beginning to the end he played with admirable spirit, and in the pathetic passages of the last act his performance was both manly and touching. Mr. Hare looked a most unmistakable admiral, and played his small part with ease and dignity; and the other characters were worthily presented by Mr. Wenman, Mr. Macintosh, and Miss Phillips.

THE CESAREWITCH.

To non-betting men handicaps are, as a rule, the least attractive of all races. Even the Cesarewitch and the Cambridgeshire, which are generally considered to be the two most important handicaps of the racing season, do not claim so much attention, in four years out of five, from those who merely amuse themselves by watching races without gambling upon them, as even second-rate weight-for-age races. At the same time, if a handicap is ever justifiable, it is in the autumn, when ample opportunities have been afforded of observing the public form of most of the horses in training. Supposing that every racehorse was one's own property, there might be some fun in trying to allot to each horse such a weight as should enable him to have a chance of being equal with all the others. A grand race under such conditions might be interesting, if only with a view to discover whether one's estimate of the powers of the various competitors happened to be correct. To those who amuse themselves by observing the running of racehorses in public, the published handicap for the Cesarewitch ought to be interesting, even with regard to many of the horses which may not run, as it furnishes an exact statement of the opinion of the official handicapper upon the relative merits of some of the best known horses in training. Like other mortals, this great authority may of course make mistakes; but his handicap presumably places every horse named in the list upon an equality. Any one with the least acquaintance with recent racing must have known before looking at the handicap that Isonomy would undoubtedly head the list; and there he was at the top of the first column, with 10 st. 2 lbs. set after his name. Now this seemed a prodigious burden, as 8 st. 5 lbs. was the highest weight which had hitherto been carried to victory during the forty Cesarewitches that had already been run. But we quite allow that the handicapper must have been much puzzled to know what to do with Isonomy, as no reasonable weight appeared to affect him; and, as a proof of the fact that racing men in general did not consider that the horse had been crushed out of the race, we may mention that he was at once made the first favourite, and was very soon backed at the short price of 7 to 1. His performance in the Manchester Cup seemed quite to warrant his position in the market, even under such a weight as 10 st. 2 lbs., and his running last year had been extraordinary. It was true that he had been beaten in the Cesarewitch last autumn; but he had given the winner, Chippendale, 7 lbs. and an easy beating in the Ascot Cup this summer. It seemed as if he were going to become a remarkably strong favourite until the First October Meeting at Newmarket, when a report was spread about that he was not likely to run, and then he went down at once to 20 to 1, and shortly afterwards his name appeared no more in the betting quotations. Thus ended what may be called the first act of the Cesarewitch of 1880.

It is needless to say that a large part of the interest of the race was destroyed by the downfall of Isonomy. With the great horse out of the way, the first three horses in the St. Leger became the leading favourites. It is very unusual for a Derby or St. Leger winner to take part in the Cesarewitch, and it is not common for the last-named race to be very seriously affected by the St. Leger; but for the first three horses in the St. Leger to become the three leading favourites for the Cesarewitch was quite an unprecedented event. At one time these three horses were each backed at exactly the same odds. Now this seemed to be the perfection of handicapping. The weights for the Cesarewitch were drawn up before the St. Leger, and yet the result of that race had been to make racing men believe that the allotment of the weights of the three leading horses would put them upon an exact equality. At almost the same odds, at the time of which we write, stood the winner of the Two Thousand, and at one time all the leading favourites were three-year-olds. The performances of Robert the Devil have been recapitulated so often that readers of racing articles must be almost weary of his name. The weight that he had to carry is a more pertinent question. Whatever weight may have originally been assigned to a horse for the Cesarewitch, he must carry 8 st. 6 lbs. if he wins the St. Leger. It so happened that in this particular instance, 8 st. 4 lbs. had been the weight put down for Robert the Devil, which seemed judicious enough, as his running in the Derby and Grand Prix entitled him to this, and if he won the St. Leger he would certainly deserve 2 lbs. more. The highest weight ever carried hitherto by a three-year-old Cesarewitch winner had been 8 st.; but then Julius, who won under that weight, had not been a winner of the St. Leger. Robert the Devil had proved himself to be a good stayer over a mile and three-quarters; but he had yet to make his reputation over so long a course as two miles and a quarter. The pace at which the Cesarewitch is run is usually very severe, and a horse must be a remarkably good stayer to win it under a heavy weight. Cipolata, who had been second in the St. Leger, three lengths behind Robert the Devil, was now to have a stone less to carry than her conqueror. The Midsummer Stakes at Newmarket had been explained away; but the fact remained that in that race she had beaten Robert the Devil by half a length on 3 lbs. worse terms than those on which they were now to meet. The Abbot had been a neck behind Cipolata in the St. Leger. Bad horse as he looked, he was undoubtedly a stayer, and he had made the great Isonomy himself put his very best leg first at Manchester. Unfortunately he went wrong within a week of the race, and eventually did not run. Petronel, the winner of the Two Thousand, had a pound less to carry than Cipolata. This mare had given him a good beating at Ascot, when he had tried to give her almost a stone, as also had The Abbot, when he had attempted to give him 5 lbs.; but at about even weights or better it seemed likely enough that Petronel might have a fair chance.

Chippendale, the winner of last year's Cesarewitch, seemed overweighted at 9 st. 4 lbs., but just before starting he advanced among the leading favourites. An almost unknown three-year-old, called Ulster, became a good favourite about a week before the race. He had only 6 st. 9 lbs. to carry, and he was said to be much fancied by his trainer. As Petronel was in the same stable, it was thought that no mistake ought to have been made about his capabilities. Another lightly weighted three-year-old was Stockmar, who had won a couple of races over long distances. He is not at all a nice-looking horse, but he can stay, and 6 st. 1 lb. was not a weight to complain of. A three-year-old of better class was Wallenstein, who had won the Newmarket Handicap over the severe last mile and a half of the Beacon course in April. He ran badly afterwards when heavily weighted, and his performances did not seem to make him out to be within 5 lbs. of Cipolata, at which weight he was now handicapped. The muscular Ridotto had been very quiet this year, but 8 st. 2 lbs. seemed too much for him. No handsomer horse was to run in the race than Exeter; but it was generally understood that his stable companion, Robert the Devil, to whom he was to give 5 lbs., could beat him at even weights.

As the day of the Cesarewitch drew near, the race became far less interesting than it had promised to be a few weeks ago. With Isonomy, Dresden China, The Abbot, and other famous horses out of the way, a good deal of the effervescence of the thing was over

before the horses went to the post. Twenty-one was under the average number of starters for the Cesarewitch, but it could scarcely be said that the field was deficient in quality. All the horses arrived at the post in good time, and they got off, to a very fair start, without much delay. Those who take any interest in racing will already have read accounts of the race in the daily papers, and the victory of Robert the Devil has been much talked about during the last three days. Many judges of racing said before the race that it would be in the Abingdon Dip, or rather on the ascent out of it, that Robert the Devil would collapse under his heavy weight; and, according to all racing precedents, this seemed highly probable. It so happened, however, that it was just in the Dip that he took the lead, and that he gained ground from his opponents on every yard of the ascent. He was four lengths in advance of Cipolata when he passed the post, and after the race he did not seem at all distressed. His victory was the most brilliant of any that had ever been attained in a Cesarewitch. It was a slow race, which was of course greatly in favour of a heavily-weighted horse like Robert the Devil; but he had the race so completely in hand from the bottom of the ascent that perhaps the pace may not have been pressed for the last few seconds. Early in the race the field seemed to be going fast, but it is very difficult to judge of the pace at which horses are going when they are seen from a distance.

As regards the bets on the Cesarewitch, it is generally believed that the professional betting men are losers, as the winner had been at a comparatively short price since the commencement of gambling on the race. Nevertheless the bookmakers can scarcely have had a bad race, as Isonomy was backed for large sums at about 8 to 1, and The Abbot stood at 10 to 1 for a long time, while Dresden China was supported for a few days at 15 to 1. As neither of these horses started, betting men who laid against them can scarcely have been heavy losers if they were able to lay against all the horses that went to the post. Since the race the question has often been asked whether Isonomy, if he had started, would have been able to beat Robert the Devil, and it has generally been answered in the negative. It would, however, be quite another question whether Isonomy could beat Robert the Devil over the same distance at weight for age, for in the handicap Robert the Devil was to have received 11 lbs. more than his allowance for age from Isonomy. Cipolata was second to Robert the Devil in both the St. Leger and the Cesarewitch, and in each case she was beaten by much the same distance. In the last-named race, however, she was meeting Robert the Devil on 9 lbs. better terms, and if she had been a genuine stayer, this ought to have enabled her to make a harder fight of it. How it was that The Star managed to run third, even under so light a weight as 6 st. 2 lbs., we cannot attempt to explain. Retreat, who was fourth, ran very well until the ascent from the Abingdon Dip, and his stable companion, the winner of last year, was close to him at the finish, beaten, but not disgraced, under 9 st. 4 lbs. A three-year-old called Schoolboy, who had hitherto been a wretched performer, ran very well as far as the Abingdon Bottom. The winner of the Two Thousand and his stable companion, Ulster, were seventh and eighth. They had not appeared very formidable at any period of the race, but they had run very fast as far as The Bushes.

In more ways than one, the Cesarewitch of 1880 was a very remarkable race, and it was no less satisfactory than remarkable. It is always a pleasure to disinterested admirers of thoroughbred horses to see a good horse win a handicap under a heavy weight, and it is gratifying to find previous public form confirmed. If anything could reconcile us to handicaps, it would be such a race as that of Tuesday last.

REVIEWS.

THE CAVE TEMPLES OF INDIA.*

THE Indian Government has shown a wise liberality in printing and publishing this splendid work; and Mr. Fergusson and Mr. Burgess will have no reason to regret the time and trouble which they have spent on its production. The division of labour was as follows. Mr. Fergusson, who began his investigations more than forty years ago, has written the preface, the introduction, and the first portion of the book, embracing what are termed the Eastern caves, or the groups near Gaya in the province of Behar, the caves of Cuttack, and some in the Madras Presidency on the river Kistna, as well as the celebrated structures at Mahavallipur on the sea-shore, thirty-five miles south of the town of Madras. To Mr. Burgess it has fallen to describe the cave temples of Western India and the Deccan, including of course those of world-wide celebrity at Ajunta, Ellora, Karlé, and Kanheri, and many others much less known. But Mr. Burgess's pages have been enriched by notes from the pen of Mr. Fergusson, who has personally inspected many of the places which he left to his colleague to describe. The volume is adorned with more than seventy woodcuts of pillars, walls, caves, and figures, human and divine; and it has an appendix of nearly one hundred plates. Some of these give the ground-plan, and others the most remarkable of the sculptures. But all are admirably executed, and afford ample facilities for those who wish to study these marvels in full detail.

In these days of rapid and unbroken intercourse with all parts of the world it may be well to recall the widely different conditions under which Mr. Fergusson commenced his arduous task. With the exception of the caves at Salsette, Elephanta, Mahavallipur in Madras, and a few others in the Bombay Presidency, the remains of Hindu supremacy lay far removed from the track of the traveller and the official. Mahommedan palaces and sepulchres, on the other hand, have always been easily accessible, and in the majority of cases are to be seen at our large stations. The tombs of Humayun, of Akbar, and of Jehangir can be taken in the morning or evening drive at the capitals respectively of Delhi, Agra, and Lahore. Futtehpore Sikri, with its beautiful architecture, is a pleasant day's excursion from Agra. Even before the annexation of Oudh, it was possible to reach Lucknow and its Imambara by carriage dawk in six hours from Cawnpore. When we wrested a noble inheritance from the hands of effete Emperors and tyrannical Nawabs, we naturally established our rule at or very near to their great cities, kept up gardens round the tombs of Vizirs and Ministers, converted the resting-place of one of Akbar's queens into a gigantic printing-office, and made picnics or let off fireworks in the enclosures of the Taj Mahal. Meanwhile the huge temples cut out of the solid rock by Hindu sovereigns whose very names seemed utterly forgotten were only now and then visited by some energetic Collector, Commissioner, or Resident during his tour in the cold season, who, after a few days' shooting in the neighbourhood, might be moved to communicate his impressions of these stupendous relics to the late James Prinsep or to the Secretary of the Asiatic Society. Then, when once official interest had been awakened to other matters than mere Revenue Settlements, the state of the village watch, or the sufficiency of the town police, it was not always easy to follow up archæological inquiries. Cuttack, for instance, was only to be reached by steamer at certain periods of the year, and at others this trip subjected the traveller to four or five nights' consecutive travelling in an odious palanquin. The province of Kattywar might well be termed remote. The caves at Ellora and Ajunta were on foreign soil, and though some fifty years ago the local magnates were hospitable and would aid scholars by providing relays of horses wherever a buggy could be driven, by collecting bearers to carry the palanquin through tiger-haunted jungles, and by lending tents and elephants, it required no small amount of scientific ardour to brave heat, discomfort, and rough fare merely to explore remains about which Mahommedans spoke contemptuously, and in which even educated Englishmen showed little interest. Railways now would in a few hours drop a sightseer within fifty miles of temples which in the time of Lord Auckland it took days and weeks to reach. Then photography had not been invented, and the process of sketching ruins in glaring sunlight and of copying defaced inscriptions was inexpressibly tedious. Mr. Fergusson, we happen to know, took his copies by the *camera lucida*, and for accuracy of proportion they are not surpassed by later photographs. It must be a source of legitimate satisfaction to a veteran like Mr. Fergusson that he has lived to fill in sketches made so far back as the year 1838; that he has found nothing radically to amend in early papers or theories which he expounded in 1843; and that he has found an able coadjutor like Mr. Burgess, accredited by the Government, and with whom, in all important conclusions, he is entirely in accord.

The result of this literary partnership is a volume which stereotypes these remarkable buildings, classifies them in distinct periods, makes some contribution to ethnology, and almost enables us to lift the veil in which early Hindu social history has hitherto been enshrouded. As a guide-book, too, though somewhat bulky, the book is complete. The caves are described with an amplitude of detail, with a clearness of plan, and with a precision of measurement which would leave little or nothing to any future Baedeker or Murray. The writers are familiar with all the leading characteristics and terms of Hindu mythology; with the trident of Shiva, with the attributes of Kali and Rudra, and with the Kinnaras, or musicians, who are at one time represented as having human heads and the legs of a bird, and at another with the heads of horses and the bodies of men. In a work so full of strange phrases and Oriental knowledge, it may seem ungracious to notice two or three slips or inaccuracies. Mr. Fergusson addresses a few words of kindly warning to Babu Rajendra Lall Mittra, while quoting from his works on Buddha Gaya and Orissa. But he blames the Babu for wasting his time in devising improbable myths to explain difficult sculptures, instead of using his influence as a Brahman to get at certain records written on palm-leaves. Now Rajendra Lall is not a Brahman any more than Mr. Crummles was a Prussian. He is one of the first three "houses" of the great Kayast caste. Ghose, Bose, and Mittra may sound oddly to us, as do many other Oriental terms, but they are known as the Kulin or high-born Kayasts of Bengal. In one place by a slip *gandarvas* is rendered by the term "harpies." In most other places the correct signification is given, of cherubs or heavenly choristers. By a mere forgetfulness at p. 126, the *Nara singha avatar* of Vishnu is translated as the "boar *avatar*." In all other places it is correctly rendered as the Lion Avatar. Varāho is the incarnation of the boar. The word "transmogrified" is

* *The Cave Temples of India.* By James Fergusson, D.C.L., F.R.S., V.P.R.A.S., and James Burgess, F.R.G.S., M.R.A.S., Archæological Surveyor and Reporter to Government, Western India. Printed and published by order of Her Majesty's Secretary of State. London: Allen & Co., Trübner & Co., E. Stanford. 1880.

scarcely one which we should look for in such a writer as Mr. Fergusson. It is fair to add that it occurs in a note, and not in the text.

From the notice of such trivial errors it is a far more pleasing task to turn to the conclusions and deductions which have been thought out without either presumptuous boast or fanciful speculation. All students of Eastern architecture will do well to bear in mind several terms which recur constantly and might be a source of perplexity. First, there is the word *stupa*, which is defined as a mound or funeral pile, a hemispherical shrine, or a "tumulus erected over any of the sacred relics of Buddha, or on spots consecrated as the scenes of his acts." The *stupa*, which in Pali becomes *thupo*, has in loose Anglo-Indian phraseology been corrupted into *Tope*. We thus hear constantly of the Bhilsa Topes, and the Sarnath and the Sanchi Topes. To make the confusion worse, Tope is also the common Anglo-Indian term for a clump of trees, and we often are told that the Commissioner or the Tent Club have pitched their tents under a "magnificent Mango Tope." In neither sense is the word ever used by natives, who associate "*Tope*" with something very different—that is, with cannon or artillery. The Dagaba, or Dagapo, is the altar, shrine, or receptacle in which the relics of Buddha are kept. Two or three derivations of the term are given, of which we rather prefer *Dhatugarbha*, or the "freight of minerals or precious things," to *Dhatu gopa*. H. H. Wilson, however, derived this term from "*Deha gopa*," or what "conceals the body." Another term in frequent use is the *Chaitya*, or temple cave, which was often attached to the Vihara or Buddhist monastery. The *Chaitya* may also mean the model of a *stupa* placed inside a temple, and would then be identical in meaning with *Dagoba*. More familiar is the Stambha, or *Lat*, or monolithic pillar, of which the most striking were erected by the famous Buddhist king Asoka, either independently of any temple or in connexion with buildings of less durable material that have long ago perished. To these four specimens of Buddhist architecture—namely, the Stupa or Tope, the chaitya-hall or temple, the Lat or pillar, and the Vihara, or monastery—Mr. Fergusson adds two others, ornamental rails and *pondhis* or cisterns. The former have in many instances disappeared. They were erected round sacred trees, pillars, and temples. A beautiful specimen of one at Sanchi is given at page 173. The cisterns were cut in the rock near the cells of the mendicants, and were fed by small channels, also rock-cut, obviously for the purpose of supplying the monks with one of the necessaries of life.

Primed with these definitions, the student of Buddhist and Brahmanical legends might draw from the writings of Mr. Fergusson and Mr. Burgess something like the following outline of a very dim and distant period of history. Scarcely anything can be known of Buddhism in India until the reign of the celebrated king Asoka, who flourished about 250 B.C., and left inscriptions in copper and other materials which have been happily deciphered by erudite English scholars. Possibly the Buddhists may have used natural caverns as temples, or have slightly improved them by art, before Asoka's reign; but the development of this style of architecture began then, and continued without intermission until the year 700 or 800 of our era. Roundly speaking, Buddhist doctrines prevailed in India and Buddhist works were executed for one thousand years. Of the tremendous schism and struggle which ended in the ascendency or the reassertion of the Brahmanical religion we have no details, and are not likely to get any from any source. Literature and history are silent; tradition is dim and vague; and architecture, even in the hands of Mr. Fergusson and Mr. Burgess, can only yield us bare results. The following is our own surmise of the process by which the sensual worship of a thousand deities prevailed over the contemplative creed which worshipped no divine object and placed man's highest happiness in final absorption or extinction. With all their priestly ambition and love of superiority, the Brahmans, in the Code of Manu, were directed to abstain from meddling with affairs of State. They had their duties and their honours, and their four periods in life—of the student, the householder, the dweller in the jungles, and the ascetic. Government and administration were left to the Kshatrya or king. Let us suppose, then, that in the sixth or seventh century of our era a race of sovereigns arose for whom the contemplative religion of Buddha had no charms, or who, under the influence of astute and worldly-wise Brahmans, could be induced to fight for the re-establishment of a religion that appealed to the eye and the feelings by a varied ritual and by costly sacrifices. In such a case Buddhism would be unequally matched against the arts of the priestly, and the prowess of the military, caste. But on any supposition the contest must have been distinguished by the violence and acerbity characteristic of social and religious rivalry in the East. Buddhism, vanquished and discredited, took refuge in lands beyond the sea, leaving behind it splendid monuments of its prime. Mr. Burgess calculates that seventy-five per cent. of the caves in Western India are Buddhistic; eighteen are Brahmanical; and about four per cent. due to the Jains. These Buddhists began, it would seem, with wood; then combined wood and stone; and latterly may have built with nothing but stone. They painted in frescoes, which the Brahmans never attempted; and, in spite of neglect, wanton injury, and a destructive climate, they have left us pictures of hunting scenes, battles, and legends and miracles attributed to Buddha. Indeed we have a quotation from the writings of Mr. Griffiths, whose scholarship is well known, which would lead us to fancy that he must have been looking on some newly-discovered legacy of an Italian painter, instead of on the colouring of a race not always associated with delicacy of conception and taste in execution. It is true that what Mr. Griffiths admired was merely the ornamentation of some panels, and not, apparently, figures of men and gods. But it is unusual praise to say that "for delicate colouring, variety in design, flow of line, and filling in of space, I think they are unequalled." For, to speak plainly, the copious illustrations of sculpture with which this volume is adorned will enable any person of ordinary intelligence to gauge the degree of excellence to which Hindu artists attained. Of the vastness and extent of some of these excavations; of their solidity, strength, and imposing character; of their rich, florid, and diversified ornamentation, especially as applied to pillars, capitals, interiors, gateways, and shrines, it is scarcely possible to speak in praise that can be called extravagant. But we must demur to comparing a Hindu god, a warrior armed for battle, a cherub or a harpy, and even Buddha himself sitting on his lotus, with the lower forms of Grecian or Roman art. Strange beings with exaggerated protuberances in more than one part of the frame, with coarse and sensual features, seated in positions to which none but an acrobat could attain without exquisite torture, or apparently swaying about with a sinuous, wavy outline utterly repugnant to artistic beauty or natural grace, will never command our admiration like a second-rate Roman Emperor, a Grecian Apollo, or a Venus by Gibson. Even the sober and contemplative Buddhist artist could scarcely rise superior to the sensuous Brahman who sacrificed to deities with four arms and strings of human heads suspended to their waists. That some of the sculptures may probably have had an Assyrian origin is a question raised by Mr. Fergusson, which we shall not discuss. But that foreign art has had its influence on these designers of cave temples there seems no reason to doubt. Some figures in one of the latest caves at Ajunta are clearly Persian or Iranian in dress and appearance; and Mr. Burgess is inclined to ascribe a Christian origin to a representation, in one of the caves at Aurungabad, of Buddha as the Lord who looks down in compassion on the human race, and has pledged himself to redeem them from ignorance and suffering, or, as a Christian preacher might say, from sorrow and sin.

The attention of the Government, without which no enterprise of this sort can succeed in India, has not been aroused one hour too soon. Some of the injuries already done to paintings, sculptures, and edifices are irreparable. Climate has had the effect which it always will have in India, but human indifference or vandalism has almost equalled the fierce sun or the incessant moisture. Here and there arms and legs have been smashed by some furious Mahommedan zealot; noisome bats *posuere cubilia* in the most exquisitely carved niches; and filthy *jogis* or ascetics have taken up their quarters in some spacious hall, and begrimed the interior with the smoke of their fires fed by charcoal or cow-dung. It is pleasing to record that the silt of one of the Jain caves at Ellora has been partially removed by the orders of the Nizam's Government, and that our own officials seem disposed to place their influence and local knowledge completely at the service of the authors and of Mr. W. W. Hunter, the Director-General of all Statistics.

There are several other topics on which we should have much liked to touch. The course pursued by the Brahmans when they dispossessed their rivals and imitated them in cutting caves from the rock; the system on which the temples were excavated and parallel alleys were cut, while portions of the solid mass were left for the groundwork of the pillars; the introduction of the figures of aborigines or low-caste men as distinguished from pure Aryans; the rarity of temples not cut in the rock, but erected by Buddhist workmen in the open air, like similar edifices in other lands; the age and characteristics of the Jain temples, especially at Mount Aboo and in Guzerat; the certain use to which architecture may be put, as different from sculpture, in elucidating chronology; the modest estimate formed by Mr. Fergusson of his labours in regard to the caves at Rajgir and Barabar, in the province of Behar; the clear and luminous descriptions of places so well known to the ordinary tourist as Elephanta and Salsette, and the equally full and ample account of the less familiar but more wonderful temple of Kailasa at Ellora, known popularly as the Ranga Mahal, or "painted chamber," really "one of the most interesting, as well as the most magnificent, of all the architectural objects" in India—in regard to all these subjects, the work supplies us with elaborate descriptions or scholarly and suggestive remarks. In one place Mr. Fergusson laments pathetically that no one has yet carried certain inquiries beyond the point where he left them. That in process of time additions may be made to the existing stock of our knowledge there is little doubt. But what is even now certain is that this volume must long be a text-book, not easily supplanted, on Buddhistic and Brahmanical architecture; that it adds to the reputation of its joint authors; and that it reflects credit on the Government which, under the pressure of famine and the search for a "scientific frontier," is not unmindful of the legacies left in India by Hindu kings and prophets long before the last sovereign, Pithura, reigned at Delhi, or the first Mahmud, the idol-breaker, had wielded his mace at the gates of Somnath.

SAINTSBURY'S PRIMER OF FRENCH LITERATURE.*

WE have more than once had to comment upon the dangers of the somewhat indiscriminate fashion now prevalent of diffusing information, or what passes for information, on all kinds

* *Clarendon Press Series.—Primer of French Literature.* By George Saintsbury. Oxford: Clarendon Press. London: Henry Frowde.

of subjects packed into small volumes. The method has perhaps its advantages, especially for people who want to get instruction as easily as possible upon subjects with which they have before been unacquainted. They must, however, run the risk of acquiring information on these subjects which is the reverse of valuable. We need not point to particular instances in which either subjects of wide interest or names of great poets have been shamefully ill-treated under this system; we may be content with wishing that all primers—or, as we believe it is æsthetic to pronounce, if not to write them, primmers—were as satisfactory as that which Mr. Saintsbury has written for the Clarendon Press Series on French Literature. The writer had an exceptionally difficult task to perform in providing a guide-book to so vast and varied a subject, within the limit of some hundred and forty pages; but he had previously shown his fitness for undertaking it by his article on the same subject in the new edition of the *Encyclopædia Britannica.* He has divided his work into ten chapters, beginning with French Literature before 1200 A.D., and coming down to living writers; and each of these chapters treats of an epoch in the consideration of which scarcely a fact or name of importance is omitted or neglected. With some of the writer's critical judgments we do not entirely agree; but it is not easy to see how, for its special purpose, that of "setting before the learner such a general view of the outline of French literary history as he may best be able to fill up for himself afterwards," the book could have been improved.

Mr. Saintsbury begins by pointing out that, while other countries—our own, for instance—can boast of a literary pedigree nominally longer than that of France, the literature of France holds a unique position as to its unbroken ease of access. The English student, that is to say, must go through a laborious process of study, as difficult as that of learning a new language, before he can appreciate the earliest English literature. Not so with the earliest literature of France, which can be read with comparatively moderate trouble, and without a special course of study, by any one who knows modern French. The *Chanson de Roland,* for instance, is not more difficult than Chaucer's works, written four hundred years later. The writer explains how the *Lingua Romana,* or Romance language, arose after the Roman conquest, and touches on some of the poems written in the new tongue, and thence goes on to speak of the *Chansons de Gestes,* the oldest and best of which, the *Chanson de Roland,* has already been referred to. A note on an abstract of a fine passage in this contains a good emendation. At the death of Roland "there was thunder and rain falling heavily, and always the earth shook and trembled from St. Michael's at Paris to Sens." The note suggests that the reading of the oldest MS. is, as seems likely to us, a mistake for St. Michel du Péril (*in periculo maris*), that is, Mont St. Michel. After the Chansons de Gestes came the Arthurian Romances, in which for the first time shopkeepers and citizens appeared as well as nobles and peasants; and with these came poems about classical subjects, of which the most important by far is the romance of *Alixandre,* "the twelve-syllabled verse of which was thought so excellent that such lines have ever since been called Alexandrines." The Trouveurs who composed these works—which were recited either by the composers or by the Jongleurs and Jongleresses—devoted themselves also to *romances, pastourelles,* and *fabliaux,* among the last-named of which is found the story of Molière's *Médecin malgré lui.* There were also in prose, besides the Arthurian Romances, sermons, and translations and paraphrases of the Bible; while to the twelfth century also belongs the beginning of playwriting in the form of Mysteries; and thus, as Mr. Saintsbury observes, we see "that early French literature was extraordinarily abundant in amount and various in form. Although its prose is a little backward, there is hardly any kind of poetry which the Trouvères had not tried, and in which they had not succeeded." To the thirteenth century belonged the special form of poem called the Roman d'Aventures, as did also the *chanson,* and it was this period which produced the two great works, the *Roman de Renart,* or, as it is generally miscalled, *du Renart,* and the *Roman de la Rose.* A perhaps less generally known fact is that in this period the first specimens, so far as can be ascertained, of comedy and of comic opera were produced by Adam de la Halle, who varied the long course of Mystery and Miracle plays by a piece called *Li Jus Adam,* in which various living personages figured upon the stage, and by what would now be called an operetta, founded on the popular *pastourelle* of *Robin et Marion.*

Mr. Saintsbury gives good reasons for considering the thirteenth century as the most flourishing period of old French literature, and he passes from it to the Decline of Mediæval Literature and the Renaissance, to each of which a chapter is devoted. At the end of the former chapter he dwells upon the farces which were prevalent at the end of the fifteenth and beginning of the sixteenth century. The most famous of these is "*Pathelin,* which is known to every student of French from the adaptation of it made in the seventeenth century. All the best of the fun is in the original version." This farce is occasionally performed at the Français, and we could wish that Mr. Saintsbury had told us something as to the form in which it is there given. No division of French literature, the writer goes on to say, except possibly the *fabliaux,* shows more clearly than these farces the bent of the national genius and the inexhaustible store of wit of a certain practical kind which the lower classes possessed. In the chapter on the Renaissance we have a good account of the Pléiade, and one, which is as good as it could be in so cramped a space, of Rabelais:—

> Rabelais was a monk who had left the cloister, who had given himself to the study of medicine, and who was deeply imbued in the learning, literary and scientific, of the time. The tendency to a peculiar kind of free-thinking, which has always been strongly developed in the French character, and which shows itself in a kind of sceptical ridicule of established beliefs and institutions rather than in an earnest and practical desire for reform, was eminently present in Rabelais. His great work, so far as it has any form at all, has that of a prose Roman d'Adventures, and probably borrowed some at least of its personages from popular works already in existence. The story, however, such as it is, is merely a vehicle for satirical comment of the most varied kind on all sorts of things, touching sometimes human nature in general, sometimes the particular circumstances of the day and the personalities of contemporaries. The license of language current at the time was very great, and Rabelais availed himself of it to the fullest extent, partly because it suited his humour, partly because it was dangerous to appear to take things too earnestly. Nor is it true that his book is a satire with a definite purpose, such as, for instance, Swift's *Gulliver.* It is rather the outcome of an extraordinarily active and powerful brain, well stored with learning, assisted by an inexhaustible fancy, and not devoid of a certain moral sense. There is, for instance, no doubt that Rabelais had an original and remarkable theory of education, and that he was violently opposed to the abuses of the Church of Rome. But he was neither a Protestant nor an infidel, though attempts have been made to claim him for both parties. A very different book is the *Institution* of Calvin. . . . The style of Calvin is, on the face of it, as much opposed to that of Rabelais as his substance. Yet the author of *Gargantua,* as if to show what in other circumstances he could have done, occasionally drops the fantastic mantle of exaggeration and burlesque in which he wraps himself, and then his language has an incomparable dignity and a sober grace superior to that of Calvin himself.

With one remark made later on *à propos* of Montaigne we are less disposed to agree altogether. Of him Mr. Saintsbury says that he is, with Rabelais, "perhaps the only French writer before our own day who deserves the name of a humourist." Now, without detracting for a moment from Montaigne's merit, this is, we think, unfair to some of the Trouveurs, among whom Rutebœuf may be specially mentioned. On this point we prefer Mr. Walter Besant's judgment, as given in his *French Humourists,* to that of Mr. Saintsbury. It would, however, be difficult to disagree with what Mr. Saintsbury has to say concerning Montaigne's style.

From this period we pass naturally to the beginning of the Classical time. Here, again, while the author does full justice within his limits to the greatest names of the period, and, as a general rule, to the lesser lights as well, he is, we think, a trifle wanting in appreciation of a man whose life was no less strange than are some of his writings, Cyrano de Bergerac, of whom some account was given not long ago in these columns. He, says Mr. Saintsbury, "composed a *Voyage au Soleil* and *Voyage à la Lune,* in which the influence of Rabelais is evident." This, if true enough as far as it goes, hardly conveys any idea of the original, and sometimes almost prophetic, invention of the fantastic writer. Later on Mr. Saintsbury is careful to point out an error which is too common with regard to the French classical drama—namely, that this was invented by Corneille and Racine, or borrowed by them from the heroic romances of the Scudéry type. To say nothing of Étienne Jodelle, the works of Garnier and Montchrestien offer a complete refutation of this notion. What the writer has to say of Corneille himself appears to us excellent, but is too concisely put to allow of quotation. The following chapter, on the age of Louis XIV., begins with Molière, and here on one point of considerable dramatic importance we must join issue with the writer. His general critical remarks on the style and method of Molière leave little or no room for criticism, and are expressed with his usual terseness and clearness. But in one of the illustrations which he uses he has fallen into what we cannot but think a mistake of judgment. "The only charge," he writes, "that can be brought against his (Molière's) plays is that, notwithstanding the range of their subjects and the truth of their handling, each one is apt to take too limited a view of the characters with which it deals." He goes on to explain his meaning by a comparison between some of the principal characters in Shakspeare and in Molière. Falstaff is very far from being a mere type of cowardice and gluttony, and "even Iago is rather warped by a devilish special purpose than wholly diabolical." This last is an opinion which is perhaps open to question; but what we are now concerned with is the following statement, that "Alceste (in the *Misanthrope*) is nothing more than embodied pride and impatience of that with which he does not sympathize." This opens the way to a controversy which, almost ever since the days of Molière, has been going on in France, and which is likely to go on as long as the works of Molière are read and acted. The weight of opinion seems now to incline to the theory that, so far from being a mere embodiment of any particular quality or qualities, Alceste is an exceedingly complex character, demanding almost as much variety and mobility of mood from an actor as does the part of Hamlet. The question, however, is one upon the adequate discussion of which we cannot at this moment enter; and we must be content, for the present at least, with remarking that there is a good deal to be said against Mr. Saintsbury's assumption. Among much that is good in this chapter we may call special attention to the writer's account of Lafontaine, whom in respect to some matters he compares happily enough to Goldsmith.

Passing over two chapters on the eighteenth century and on the period from the Revolution to the Restoration, with the observation that they are as full of matter and of keen appreciation as is the rest of the book, we come to the two concluding chapters, on the Romantic Movement and on Contemporary French Litera-

ture. The subjects with which the writer here deals are better known to the general reader than is the history of early French literature, and what little comment we have to make upon Mr. Saintsbury's treatment of them is chiefly of an admiring kind. His remarks upon M. Victor Hugo are excellent, and make a good answer, if any answer were wanted, to the attempts of certain poetasters to decry a writer whose greatness they cannot comprehend. No less to the purpose are his succeeding observations on Sainte-Beuve:—"As Victor Hugo was the poet of the new movement, so Sainte-Beuve was its critic; and, like the poet, the critic retained for the whole of his life the superiority which he obtained at the beginning of his career." The first work of importance which he composed was the series of *Tableaux de la Littérature Française au XVIème siècle*, which appeared in the *Globe*, and which "at once reinstated the older writers of France in the place which since Malherbe had been denied them, and directed the rising generation to the proper places to look for models of language and style." He had a comparative failure as a writer of purely original work, but, recovering from this, and devoting himself afresh to purely critical work, he became perhaps the most celebrated prose critic of any age, founding, indeed, an entirely new school of criticism, as Victor Hugo has founded an entirely new school of poetry. "In this, his later career, Sainte-Beuve was judged, partly from personal motives, to have ceased to be a Romantic; but this was simply because the true import of the literary revolution was mistaken. He worked his work, Hugo his, and the effect of the lives of the two men has been an entire revolution of literary principles and practice in every country in Europe, except where, as in England, native genius had anticipated the necessity of any such change."

In one matter only in these last chapters are we at all disposed to find fault with Mr. Saintsbury, and that is, for saying that George Sand's later studies of provincial life are more admirable than the "powerfully coloured, but too often extravagant and tedious novels written in her earlier days," and at the same time making no mention of *Consuelo*. Having said this, we have picked all the holes that we can pick in Mr. Saintsbury's work, and we may leave off as we began, by recommending it as a work which is both excellent in itself and admirably fitted for its special purpose.

STRICTLY TIED UP.*

THE author of *Strictly Tied Up* loves to look on the lively side of things, and his novel may be described as a comedy of life and character. All his personages are more or less conspicuous by some eccentricity, foible, or amiable weakness; his incidents and complications are generally humorous, and the drollery is brought to a climax in the *dénouement*. There father and son marry daughter and mother, the couples having chosen to mate themselves so as to cause a ludicrous entangling of relationships. There is no lack of action and movement; there is plentiful variety of scene; and in the changing society to which we are introduced the author shows abundant knowledge of the world. Now we are in the city, now in the country; we pay flying visits to London and Dublin; and, while both of the heroines have their homes in Yorkshire, one is transported to a country seat in the wilds of Ireland, where, on a visit to certain noble relatives, she is launched on the adventures that land her in matrimony. There is one point in the novel that will recommend it to most readers. Though the author goes back upon the family histories of his personages, discussing their pedigrees and antecedents perhaps at unnecessary length, yet, to borrow the language of commercial men, he brings the interest of the story down to date. We are transported to the Ireland where Land Leaguers are in malignant activity, and where landlords are liable to be shot from behind walls. As it happens, no tragedy of the kind occurs to stain the present pages. But Lord Foulisville, the Irish peer of the book, had more than the qualifications necessary to provoke his condemnation by the self-constituted avengers of the national wrongs. He was the descendant of a Saxon who had had the soil transferred to him on somewhat questionable terms from a "good ould Celtic stock," in the redistribution that followed the battle of the Boyne. He was an absentee for the greater part of the year, spending the "rints" in display and self-indulgence in London. And as he loved his luxuries, and kept up a good establishment, and was always over head and ears in debt, it may be presumed that he was hard upon his tenantry in self-defence. Nor was the Foulis's family bill of health by any means a clean one in Celtic eyes. Lord Foulisville's ancestors had ratted repeatedly, but had always aimed at a good understanding with "the Castle," and the peerage had been given as the price of the vote which had helped to barter away "the independence of Ireland." So that platform orators might have found ample material for denouncing the bloated Saxon aristocrat who battened on the flesh and the blood of his serfs of Ballybanaghermore. This history of the Foulis family is doubtless a faithful sketch of the rise and progress of many a modern Irish dignity. Nor is the changing of the names on the property—another substantial national grievance, by the way—less true to nature. The mansion of Ballybanaghermore had become Fontarabia; for it was in the days when many places in Ireland were rechristened after the sentimental fancies of romantic purchasers; and even the legendary islet of Iniscormac in a neighbouring loch had been altered, much for the worse, to Diana's Island.

To make matters specially unpleasant for the Earl, a person claiming to represent the ancient Lords of Ballybanaghermore, and undoubtedly bearing their proud name of McSwinny, lived in the immediate neighbourhood. This Mr. McSwinny is represented as a characteristic type of the yeoman, in rank something beneath a squireen, though we suspect him to be slightly overcoloured. He was a miller and money-lender, the representative of a line of millers and money-lenders, who, having made themselves masters of a wide tract of country, had laid their embarrassed dependents under heavy contributions. McSwinny, in nursing his hereditary wrongs, naturally detested the Earl of Foulisville, and would very gladly have shot him or seen him shot. But, as the author observes, with a subtle touch of humour, his dignity of station forbade him the indulgence. For McSwinny too was likewise a landowner, though in a small way; and for one landlord to assassinate another would have been to lower himself to the level of evicted tenant-farmers. It was not this descriptive touch we had in view in suggesting that McSwinny was somewhat overcoloured. We were thinking rather of a story told in illustration of his amicable relations with the peer which seems almost too good to be probable. The Foulisville house party had gone on a picnic to the romantic loch of which we have spoken. An accident happened to the only punt on the water, and two of the party had been cast away on the island. The only other available boat in the vicinity belonged to the churlish miller, McSwinny, and Lord Foulisville had stooped his pride to the point of sending an embassy to borrow it. It was probably in accordance with the Celtic character and the fitness of things that McSwinny should make the envoys of his enemy swallow a great deal of humble pie. It is even conceivable that he should have refused point blank, though the lives of a couple of innocent persons were in question, and neither agrarian nor political considerations were involved. But we can hardly imagine even an Irish usurer indulging, under the circumstances, in the grim joke of haggling leisurely over an exorbitant charge for the boat, and delaying the emissaries afterwards over a demand for the hire of the oars. The story is, however, so capitally told that many readers will no doubt think our objection hypercritical.

The Anglo-Irish aristocrats are not made much more attractive than their neighbour Mr. McSwinny. The Earl of Foulisville is a spendthrift, half reformed by stern necessity, who has fallen back, by way of consolation, on his favourite vices of *gourmandise* and hard drinking. He comforts himself in the wild solitudes of his Irish domain with the services of a French *chef* and the contents of a well-selected cellar. The Countess, a *parvenue* whom he had married for her looks, feels her banishment to the wastes even more deeply. She finds but indifferent solace in the society of a lady whom she has installed in the post of companion and confidante, and with whom she subsequently has good reason to quarrel. So it occurs to her to seek out a daughter by adoption, whom she may launch sooner or later on the fashionable world, and it is this idea of hers that brings us into contact with the real heroines of the tale. The Honourable Mrs. Foulis of Yaxley in Yorkshire is a clever and very engaging woman, albeit somewhat mercurial and bustling. She was an heiress who had been duped, when a girl of sixteen, into marrying the *roué* brother of Lord Foulisville. Luckily for her, she lost him by an accident within a very few months of her unfortunate marriage, and since then the world had gone well and smoothly with her. It is true that her daughter, the sole remembrance left her of the ill-assorted union, was by no means all she could have desired, being commonplace in looks and somewhat cross-grained in disposition. But the two got on together fairly well, and the widow, who is being rapidly enriched by the discovery of coal-mines on her property, finds almost a superabundance of the occupations in which she delights. Nor does her luck end there. For circumstances take her child off her hands, while she meets with a singularly agreeable life-partner to assist in the administration of her property. It is here that the main interest of the story comes in. Meriel Foulis has gone on her aunt's invitation to Fontarabia, and, accompanying her hosts to the picnic at Diana's Island, has far more excitement than she had bargained for; while the "pleasures" of the day are pregnant with her fate. The shipwreck that engulfed the family plate with the provision hampers comes as a godsend to a scheming elderly baronet who has set his affections on Meriel's fortune. He persuades the innocent young lady that he has saved her life; abuses their lonely *tête-à-tête* on the island to propose to her; and half cajoles, half terrifies her into accepting him. Subsequently he avails himself of the illness of her aunt to wheedle her into a clandestine marriage, and then, feeling that he is master of the situation so far as the heiress is concerned, he dictates a letter to his wife, in which she prescribes terms of reconciliation to her mother. Meanwhile the lively Mrs. Foulis has been cheering her loneliness by entertaining a visitor, and when the letter, which is half an ultimatum, arrives, her guest has obtained the right to advise her. No one is more competent to act as counsellor on the occasion, for he knows the real author of the communication intimately. In fact, Mrs. Foulis's visitor is no other than Mr. Eustace Brandreth, whose father has just eloped with Mrs. Foulis's youthful daughter; while Mr. Eustace has been persuading Mrs. Foulis to accept him as her

* *Strictly Tied Up.* A Novel. 3 vols. London: Hurst & Blackett. 1880.

lord and master. Her choice is a wise one. Eustace Brandreth is only one year her junior; he is the reverse of his disreputable father in every respect—among other things, in being an excellent man of business; and though, being penniless, he has married a rich woman, yet after all he has not shown himself so very interested, since she has only a life-interest in her property. At least he and she and Meriel, Lady Brandreth, and above all, the deep-scheming Sir Miles himself, believe that the reversion is vested absolutely in Meriel. It is not till after Mrs. Foulis has been fairly married for the second time that they are undeceived. Then it comes out that, by the provisions of the settlement, her second husband, should she marry again, is to have the life-rent of all her estates and personalty; while, in the event of there being a boy born of the union, he is to oust his elder sister, Miss Meriel. Of course the marriage of Mrs. Foulis is fruitful as well as happy. There is a son to inherit the "strictly tied up" acres and coal-mines; and the undutiful Meriel, and the veteran fortune-hunter who entrapped her, are punished where they had sinned, by being beggared and afterwards pensioned out of charity. It will be seen that there is humour as well as sufficient excitement in those volumes; not a few of the descriptions both of people and scenery are exceedingly graphic and piquant; while the *dénouement* is happily conceived and carried out with no little ingenuity.

THE ENGLISHMAN AND THE SCANDINAVIAN.*

MR. METCALFE'S volume would perhaps have been pleasanter in the reading if he had been less anxious to make it light and amusing. He takes credit to himself for this anxiety, and assures us that "instead of taking all things *au sérieux*, he has ever and anon, as Horace recommends, tried to temper the grave with the gay, to enliven the subject with illustrations new and old, to point the theme with novel applications, and thus to carry off agreeably what might otherwise have proved heavy reading." But unless these applications and illustrations are fairly to the point, they are apt to become tiresome; and if the work before us is serious, it is not easy to see what is gained by treating it as if it were not serious. Mr. Metcalfe seems to think that the attractions of the Edda are likely to be enhanced if he speaks of Heimdall as the "model of porters," who "far out-Rolands Roland, for his horn is heard all the world over. His teeth are of gold. For durability we should have preferred bone cased with enamel." Odin himself is treated after the same fashion, as being "the fountain-head of wisdom ever since he got that drink of Mimer's well and pawned his eye for it, and thought it a cheap bargain, which curious transaction to a man apt at discovering resemblances in remote ideas is suggestive of that over-addiction to the pursuit of learning which has forfeited the eyes of many and helped to make the fortune of the spectacle-makers." If we look to the old story, the connexion of ideas may seem to us very remote indeed; and when Mr. Metcalfe adds in a note that philosophers regard the tale as an allegory of sunset in the sea, some may be tempted to reply that the remark is much more smart than accurate, and that for the sake of supposed sprightliness of style the author has sent his reader on a wrong path. It may be clever, but it is not altogether close to the evidence, to represent the dwarfs who slay Kvasir as saying that he had been "suffocated by his own knowledge, because he could not meet with persons able to ease and disembogue his mind of the wisdom there accumulated by proposing to him such learned questions as were necessary to his relief." Then follows the moral and the application. "It is a pity that there was no Vulcanian midwife, or Civil Service Examiner, at hand to do for Kvasir what was done with Jupiter to his great comfort and speedy recovery when he was similarly afflicted. . . . . The fate of Kvasir ought to be a caution to our modern youths against the frightful results of overcramming." But a story can scarcely be allowed to have two morals; and the warning against cramming seems to be forced in, if the true cause of Kvasir's death be, as Mr. Metcalfe says it was, that "merit, then as now, excited envy, and two dwarves, a race always proverbial for spite, set upon him unawares and slew him." It would seem from this that if they had only let him alone, Kvasir might have continued to bear the weight of his learning as he had borne it in times past.

It is perhaps from the wish to be amusing that Mr. Metcalfe uses such words as "lengthy" and "reliable," and speaks of the sack of Rome by the Goths as warning the Romans in Britain to "contract their feelers," and of English ladies as "joining in the stampede of pilgrimage" to the Eternal City. So when Lullus had sent to Gutberet, abbot of Wearmouth, a piece of thick stuff to keep out the cold, the old man, we are told, "won't have it, not he." But it would be ungracious to cite other instances of these not very happy pleasantries. We will end our fault-finding with the remark that some printers' mistakes which have been allowed to remain might with advantage have been removed. No one perhaps supposes that St. Boniface was eighty-five years of age at the time of his martyrdom; and when we read in a note, p. 242, that "in the Veda night is author of dawn (*Hibbert Lectures*)," we can only guess from its matter that the reference is to the series of 1878. The truth is that the subject with which Mr. Metcalfe has undertaken to deal is both serious and important, and he has treated it on the whole with very sufficient seriousness and earnestness. Nothing is gained, he rightly urges, by representing things to ourselves as different from what they really are. The English language, as it was brought into this country by the Teutonic invaders of the fifth century, and perhaps by some who had long preceded them, had a literature which was not immediately brought to an end by the Norman conquest. The kindred tribes which made their abode in Norway and Iceland had also their literature. What are the characteristics and what are the respective values of the two? If we are so silly as to suffer what may be called patriotic feeling to have undue weight with us, it must be allowed that Mr. Metcalfe's conclusions will not be in a high degree gratifying. The one question is whether they rest on facts, and there is no doubt that facts justify his assertion that the Englishmen of Alfred the Great never had a vernacular historical school like the Scandinavian. He may well wish that Bede had written in his own tongue, and add that "then we might have known what the English of that day really was," instead of having but a faint echo of it in the inscription on the Ruthwell Cross, and in the few lines improvised by Bede before his death. Mr. Metcalfe does not hesitate to say that the literature of England was blighted and crushed by the influence of Latin Christianity. The unskilled people spoke their own language; those who had any education thought and wrote in another. The result was disastrous. "The mental habits of the people became saturated with the prevailing colour of their teachers' solemnity and dulness. The domestic infant was overlaid and crushed by an alien intruder. When Anglo-Saxons did write in their own tongue it smacked of Italy and book-learning." Everything was done to promote the composition of devotional and religious treatises, and to discourage the growth of "the true complement to this mental nourishment," in which "the Anglo-Saxons, like all peoples in the early stages of their existence, delighted—the national ballad, the foundation of all history." Nor was the sacrifice made to much purpose. Even those who professed a knowledge of Latin were for the most part utterly ignorant of it. Many priests were unable to utter the Church formulæ correctly, or to baptize a child without a blunder. "The Latin rage at last," Mr. Metcalfe remarks, "stood convicted as a delusion and a snare, and fell into discredit and decay, so much so that Alfred in his preface to the Pastoral expresses his astonishment that his countrymen had written Latin books and had not left translations of them." Nor could this deplorable state of things be ascribed to the Danish invasions, for the picture drawn by Alfred applies to a time before the churches were spoiled and burned, and while they were yet filled with books, from which, as Alfred rightly said, they reaped very little fruit, because they were not written in their native tongue. To this predominant influence of Latin Mr. Metcalfe traces the comparative inferiority of such English literature as could spring up under these conditions. Of the great historical document known as the Anglo-Saxon Chronicle, as a composition, he has no high opinion. All who are not carried away by the enthusiasm which regards it as the most valuable original work extant in any language must, he thinks, confess it to be disappointing. That it may be compared with any similar work of its age, if such exist, is not saying much. It is wholly devoid of proportion. The mortality of birds forms the single entry of one year, as the death of Theodore and the change from Roman to English bishops forms that of another:—

> Critics [he adds] have apologized for the lack of attractive details by explaining that it is merely a book of annals, not a history; but when once or twice the spell is broken and a real historic interest is given to the narrative—as, for instance, when Egbert's grandson Alfred, after many ups and downs, makes head against the Danes, and his exploits are recorded with abundant life and vigour—they point with rapture to the fact. This seems rather like running with the hare and hunting with the hounds. But generally, if we discard an unduly optimist tone in our judgment, must we not admit that there is a something wanting generally in the extant works of the Saxon pen, an absence of filling up the outlines, which makes those days somewhat vague in their import, bald and unsatisfying in their presentment? We should like to be more intimate with our Saxon forefathers; we do not quite know what manner of men they were. . . . What did that man look like, was he tall or short? . . . These points it seldom occurred to the Anglo-Saxon writer to mention. . . . Such a remark as that recorded by Snorri as made by the gigantic Harold Hardrada just before the battle of Stamford Bridge, about the personal appearance of Harold Godwinson, "He was a little man, but he sat firmly in his stirrups," does not find its parallel in the Saxon Chronicle from end to end.

For the purpose of giving us this personal knowledge of the English in the earlier ages of their abode in this island such poems as the great epic of Beowulf are not of much use. The scene is laid in the halls of the great, and not among the walks of every day life; nor is Mr. Metcalfe willing to admit its strictly English character. He lays stress on the general opinion which holds it to be of Swedish origin, and its finest passages suggest to him a comparison with the Icelandic Grettir-saga. The comparison is perfectly legitimate; but it warrants, and indeed enforces, a much wider conclusion than Mr. Metcalfe would probably care to defend. It is even possible that in the Saga there is one word which completely identifies Grettir with Beowulf:—

> The water-troll assails him with a weapon which people called a heptisax, a strange sort of weird dagger, and which therefore required a particular explanation. This is the very name of the *hafted-sword* (haeft-mece) with which Beowulf attacks Grendel's mother, and the word never occurs again, I believe, in any Icelandic author.

The saga and the epic poem have thus a common groundwork. Was the Beowulf story then carried from England to Scandinavia

* *The Englishman and the Scandinavian; or, a Comparison of Anglo-Saxon and Old Norse Literature.* By Frederick Metcalfe, M.A., Fellow of Lincoln College, Oxford. London: Trübner & Co. 1880.

and Iceland? and, if so, when was this done? The question does not necessarily follow from this agreement, whatever it may be; nor need we suppose a contrary course in the migration of the story, because we may "discern some of the germs of the Anglo-Saxon poem" in the Icelandic poems themselves. In Mr. Metcalfe's opinion, "Beowulf perishing, after he had slain the monster, by its venom looks like a reference to the Edda myth of Thor dying by the poison of Midgardsorm, when the monster was already slain." The incident may point in this direction; but it has an affinity not less close with the story of Herakles dying from the blood or venom of Nessus, whom he had slain, and Beowulf might therefore be traced as easily to a Greek as to an Icelandic source. In either case we should have to stop short of Mr. Metcalfe's inference or to go further. But, when we turn from old English to Scandinavian literature, the contrast is as striking as Mr. Metcalfe's strongest expressions would imply. We have in the former nothing like the vast variety and the astonishing vigour which characterize the whole saga literature of the Northmen. Nor can much weight be attached to the fact—if it be a fact—of the comparatively late growth of the latter. There are no Scandinavian MSS. earlier than the thirteenth century; but Mr. Metcalfe urges

> that some three hundred years after England had been in a great measure converted to Christianity and become acquainted with Roman letters and with Roman culture, ancient and modern, Scandinavia was still Pagan, with no Southern culture; and Runic ristings were all her artificial appliances for preserving historic facts. But, though not written down on material tablets, there was an unwritten literature existing among the Northern barbarians, begotten of their genius, full of life and warmth, stamped indelibly on their minds, which, as soon as ever they had the means of bringing it before the world, issued forth, like Minerva from the head of Jupiter, in a great measure in its present bodily shape.

Certainly we shall look in vain to the old literature of England for anything like the power of imagination and the mingled strength and tenderness which mark the stories of the Helgis and the Volsungs. The old Edda, in the name of which we are, it seems, to see a word denoting poetry, and not, as has been commonly supposed, the grandam who recited the stories, is indeed a storehouse of the richest treasures, although some have deplored that in its present state it contains not a thousandth part of what once existed. But enough has been preserved to show the mental powers of the people among whom they sprang up, and to throw a marvellous light on the course of thought among the Aryan nations generally. The story of Sigurd and Brynhild carries us naturally to that of the Nibelungenlied; and here Mr. Metcalfe has unfortunately not resisted the temptation furnished by the names of some of the actors in this poem to dwell on the way in which historical personages and historical events are introduced into mythical tales. Thus the three Burgundian kings of the Nibelung lay "are matter of history"; and "Attila, his brother Bleda (in the Nibelungen Blödelin), and Dietrich of the Nibelungen Lied, who was of the blood of the Amalungs, the royal race of the East Goths, are also historic personages." The theory, it must be admitted, dies hard. In his recent *Introduction to the Science of Language* Mr. Sayce has dealt it a crushing blow. Speaking of these transformations of the Icelandic Jörmunrek into the Gothic King Hermanric, of Atti into Attila, of Gunther into the Burgundian Gundicar, and of Brynhild into Brunehault, he remarks:—

> The coincidences between the myth and actual history seem too numerous and striking to be the mere result of accident. And yet such is the case. The Attila of history died in 453, two years before the birth of the historical Theodoric, and Jornandes who wrote at least twenty years before the death of the Austrasian Siegbert was already acquainted with the name and story of Swanhild, the child born after Sigurd's death. If more were needed, the Icelandic and Saxon versions of the legend would prove its mythic antiquity. The historical colouring thrown over it by the version of a literary age is but deceptive; the old Teutonic story of the waxing and waning of the summer sun was told and sung long before the time of Gundicar and Attila, long, in fact, before the beginning of the Christian era.

Mr. Sayce is, of course, well aware that others have said this and proved this before him; and it is to be regretted that an idea thus doubly and trebly slain should again be thrust forward, more especially when at the best no solid results could be obtained from it. A crop of mere names can never be converted into a harvest of facts; and there is enough of sound and most judicious criticism throughout Mr. Metcalfe's volume to show that such barren theories have in his eyes no real value. By comparing impartially and without prejudice the ancient English and Scandinavian literature he has done a service which calls for the grateful acknowledgments of historical students and of scholars generally; and we may safely say that none will rise from the perusal of his pages without feeling that they have been instructed as well as interested.

GOLDEN GLEAMS.*

MR. JOHN T. LLOYD, the editor of these *Golden Gleams*, is well skilled in the art of sinking. He begins by telling us that the popularity of Mr. Henry Ward Beecher in his own country is greater than that of any other living man. He is, he adds, nearly as well known in England as in the United States. He is, besides, the most wonderful pulpit genius of his age. So far the conception that Mr. Lloyd raises in our minds of this preacher is as high as it is new and surprising. Hitherto we had not been aware that he was a genius, still less that he was a pulpit genius, still less that he was a wonderful pulpit genius, and least of all that he was the most wonderful pulpit genius of the age. His editor has carried him up as high as even the highest of the old three-deckers, as they were called, of any City church, and in a moment he brings himself, us, and his hero all to the ground. "Mr. Beecher's sermons," he goes on to say in the very next sentence, "are read with interest and instruction wherever the English language is spoken, and many of them have been translated into other tongues." Is this all that can be said of the most wonderful pulpit genius of the age, that his sermons are read with interest and instruction? Those surely are the terms which are fittingly applied to an address of an Archbishop at a Temperance meeting, or to a paper read before the Social Science Congress. They have far too cold a sound for genius. It may be that the present age is dead to all enthusiasm; or, on the other hand, it may be that Mr. Lloyd scarcely knows what genius means. The selections that he gives are taken, he says, from the preacher's "latest utterances, and represent, therefore, his ripest, best-digested sentiments." The best-digested sentiments of a wonderful genius have a strange sound about them, though we are not at all sure that they would not make as telling a title as even "Golden Gleams." For ourselves, if we must study the geniuses of the modern pulpit, we should prefer examples from their writings that were not quite of the ripest. The more years that they live to preach the more skilful do they become in the art of making a little go a great way. Mr. Beecher is, we learn, "an extemporaneous speaker. He is an orator. His mind works spontaneously, quickly, and logically." If we might venture to add one term more, we should say that it works expansively. It deals with a thought just as a child deals with a little soap and water. It swells it out into very large proportions. No doubt the effect produced is pretty enough. There is no want of variety of colouring, and it is surprising to see how very much can be got out of so very little. But bubble-blowing, whether of the child or of the pulpit genius, at last becomes tiresome, and over three hundred and fifty specimens of such skill are far more than we care to have at one time.

To an Englishman the most interesting passages in these extracts are those in which Mr. Beecher writes about our country and his own. We feel that there we are on surer ground than when we attempt to follow his footsteps as he guides us in the path of morality and religion. "I know what the affections are. I have tried them," he says on one occasion. We distrust a man who proclaims that he has tried the affections, and that therefore he knows them. If our memory does not deceive us, it was on the affections that Sir Barnes Newcome lectured. He also had tried them. When, however, Mr. Beecher sticks to facts, then we can read him with interest. He tells us, for instance, what an intense hater of the British he became when he was a schoolboy. He was "fired with the combative patriotism which the school-books taught at that time." It was not, he adds, until ripe and middle life that he ceased to cherish a spirit of animosity towards England. We must do him the justice to admit that he seems to have got over his ill-will to a very creditable extent. He is proud, he tells his congregation, of having English blood in his veins, and he is not niggardly in his praises of us. "I do not suppose," he says, "there is on earth another nation in which the hand of liberality was ever so full and so open." At the same time, he rather takes away from the pleasant feeling produced by this praise when he adds that "more than all other nations, perhaps, England represents abroad the spirit of war," and that "her Government more than any other on the globe has frowned upon nations struggling for liberty." It is rather hard to find ourselves reckoned below Russians and Turks; but, if Mr. Beecher has tried the affections, he has not tried either of those two nations, and so possibly he knows nothing about them. The combative patriotism of the American school-books throws a curious light on the state of feeling which we so often notice with regret in citizens of the United States towards this country. Our experience in English school-books has not been small, and yet we cannot call to mind a single passage in a single book which would raise in one of our children any ill-will towards the United States. No doubt it was in their country that the war of Independence was fought out, and that the worst sufferings of war were caused. Yet they were the conquerors, and it is always reckoned easy for conquerors to forget and forgive. We are glad to believe that the modern American school-books teach a patriotism that is a little less combative.

Mr. Beecher is, however, scarcely so complimentary to his own countrymen as he is to us. We doubt whether Mr. Spurgeon, who, we take it, would be reckoned our most wonderful pulpit genius, would speak quite so ill of our men of business as Mr. Beecher does of theirs. "If," he says, "a man in regular business finds that ten dollars have been passed on him, what does he say to-morrow, when you ask him, 'Where is that ten dollars?' but this: 'I guess I let it slide.'" Men in business are still, as ever, the mark of the preacher's aim; but among the heavy faults commonly laid to their charge in this country is not the crime of passing forged notes. The account that Mr. Beecher gives of the judges in New York is even worse

* *Golden Gleams.* From Rev. Henry Ward Beecher's Words and Works; being a Choice Collection of over 350 Extracts from the Latest Writings, Sermons, and Lectures of the Celebrated American Preacher and Author. Newcastle-on-Tyne: The Tyne Publishing Company. 1880.

than that of the men in business whom they ought to judge. It is not all New York judges that he condemns, but the elective judges of the city. He considers the somewhat improbable application of one of these magistrates for membership in his church. "Do you suppose," he asks of his congregation, "I would say to him, 'Venerable sir, I greet you! At last you have turned from your evil way, and now you wish to walk upon the fair and smiling road to Zion.' No, I should say, 'Sir, where is that bribe of ten thousand dollars that you took last week? . . . . How stand you with those drinking, rowdy, wicked men by whose votes you came on to the bench?'" The account that he gives of the working of the Ballot is quite as bad. He describes the various tricks that are played with the voters and the boxes, from the beginning of the poll till the time comes for putting into practice "the infernal art of counting." Both sides, he says, are equally guilty. "Cheating is fought by counter-cheating. Inspectors are bought, and then bought over again. Judges are bribed to dishonesty, and then bribed back to honesty." If elections are carried on in this fashion, it is not surprising that, as he says, "to nominate a man for office in our land is to stigmatize him, and to elect him is to damn him." While Mr. Beecher is justly severe in his condemnation of the corrupt judges, we find him in one passage slurring over in a way that is very offensive the doings of a criminal. He tells of a man who "had unconsciously, by the exigencies of his life, been drawn into the circulation of counterfeit money." Why cannot a man in regular business, or a New York judge, or an inspector of the ballot-boxes be also unconsciously drawn into the particular crimes characteristic of their respective classes? Have their lives no exigencies?

When we pass from the few passages in these selections in which something may be learnt of the condition of the United States to the displays of oratory, we find little to reward us for our pains. Mr. Beecher is a man of many words but few thoughts. He is a rare master of adjectives, and can yoke them on to one poor noun just as an Esquimaux yokes a dozen pairs of dogs to one rickety sledge. He tells us, for instance, that men's minds are magnets. In the next line he rather jumbles up his metaphor by adding that the mind seeks that which shall feed its strongest faculties. He then describes the different kinds of filings that different classes of minds draw, and so he comes to a mind which "has an inward want of a conception that is all beaming, and genial, and sweet and tender." He delights, too, in using as big a word as he can lay hands on. Big words would seem to be the filings that his magnetic mind draws. He tells, for instance, how a father, in answer to an intelligent child who should ask him "What is a storm on the ocean?" oscillates a pail of water. He describes Christ as one who has control of the terraqueous globe on which the nations tread. This, we imagine, may be his expansion of "The earth is the Lord's." We are reminded how Johnson once picked up a Paraphrase of the Gospels, and found the words "Jesus wept" swelled out into "The Saviour of mankind melted into a flood of tears." "Puppy!" he said, in his indignation against the author, and sent his book flying to the other side of the room. Mr. Beecher rises very frequently into the high regions of the modern poet. "What," he asks, "are clouds to you?" He does not give time for an answer, but exclaims "To me they are babies' baskets." "Did you ever," he asks on another occasion, "did you ever go by a rose-bush in the morning, when the dew was on it, and it was saying its prayers?" If the reverend gentleman's chapel boasts of a clerk, the only proper response that he could make to such a question would be "Fudge." Now and then we come across a passage which has in it something of that kind of humour in which Mr. Spurgeon is strong. He tells in one place of people who say that they make it a rule to read the whole Bible once a year, "and I have no doubt that they skate over it once a year." He describes a man starting for business, and being reminded by his wife that "they had not had prayers. Back he goes, and takes his Bible and turns to the twelfth Psalm. He chooses that because it is short. Blessed be the Psalms, they are of all lengths and shapes to meet every emergency." In one passage he reminds us of a story told of Lord Eldon, though the preacher by no means improves on the Chancellor. He is writing about what the people call the "awful responsibility" of being a minister. "People sometimes say to me, 'I should think you would shudder when you stand up before your congregation?' I shudder? What should I shudder for? Do you shudder when you stand up before a garden of flowers?" Lord Eldon, when one day he was going to speak at a City feast, said that he felt very nervous, as he always did when he had to speak before an unfamiliar audience. "Do you not feel nervous," some one asked him, "in addressing the House of Lords?" "No more," he answered, "than if I were speaking to a row of cabbages." If Mr. Beecher knew the story and borrowed the thought, he may have found it needful to give it a little polish, so as to render it presentable to his polite congregation. No assembly could be offended at being compared to a garden of flowers; but a row of cabbages, even though golden gleams were allowed to fall on them, would have been scarcely a fitting term to address to the most select congregation in the States.

SMITH ON THE LAW OF NEGLIGENCE.*

MR. SMITH can scarcely be deemed fortunate in the time he selected for publishing this book. Not foreseeing the persistence of the present Government, and probably imagining that the Employers' Liability Bill would share the fate of other abandoned measures, he gave his work to the world whilst that enactment was still in an inchoate stage; the result being that much of the elaborate dissertation which he devotes to the subjects of master and servant, common employment, &c., will, as soon as the Act comes into force, become purely matter of history and utterly useless for practical purposes. That this part of Mr. Smith's book should have so short a career is the more to be regretted, inasmuch as it appears to contain an exceptionally lucid and careful exposition of the state of things which is to terminate on the 1st of January, 1881. Pending the transition, Mr. Smith has adopted what was perhaps the best course in the circumstances. He could not expunge this portion of his book, seeing that it is still law; so he has added a supplement containing the Employers' Liability Act, 1880, with Introduction and Notes, which can also be purchased separately by those who had become possessed of the book in its original form. This can, however, be but a temporary expedient, and we fear it will be necessary next January for Mr. Smith to issue a remodelled edition of his work, omitting what will then be obsolete. The duration of the Act is fixed at seven years—a period rather above than below the average efficient existence of an edition of a law book; and if at the expiration of this term the Act be not continued in force, Mr. Smith will have his original work to fall back upon, and will at least be able to utilize much of his old material. Still we fear he must be annoyed at what has occurred, and must consider himself, with some justice, as a victim of unexpected legislation. Apart, however, from any question of master and servant, the law of negligence presents many interesting features, including as it does a very large proportion of the causes of action arising otherwise than *ex contractu*; and with this law, as propounded by Mr. Smith, we now proceed to deal.

And, first, Mr. Smith defines "negligence in law" as being "a breach of duty, unintentional, and proximately producing injury to another possessing equal rights." He appends a sort of sub-definition, explanatory of each of the terms used in the above sentence, of which, however, only the last, that dealing with the clause "possessing equal rights," seems to call for special notice. Mr. Smith's justification for this clause is as follows:—He says that if a man has no right to do a thing, or if his right to do it is subordinate to the right of another, any injury caused by his doing it is actionable, apart from any question of and not under the head of negligence; and he thence deduces that the question of negligence can arise only where the rights of the parties are equal to start with. It is no doubt true that in almost all cases of negligence relative rights exist; but we much doubt whether the universality of the proposition can, in the face of recent decisions, be established; the rights, though relative, being frequently such as would scarcely be justly termed equal.

When Mr. Smith comes to treat of the various kinds of duty the breach of which may constitute negligence, he very properly discards the lax and vague distinctions of "slight negligence," "ordinary negligence," and "gross negligence," and divides his subject under the far more rational headings of (1) Neglect of duties requiring ordinary care; (2) Neglect of duties requiring skill or an extraordinary amount of care; (3) Neglect of duties requiring less than ordinary care. Following up the first of these heads, we find that under it Mr. Smith classes all those relations wherein, without any question of skill being particularly stipulated for, the benefit is pretty equally distributed between both parties, or where both parties are pursuing their ordinary vocations. Briefly put, this class includes all the conditions and circumstances in which experience has shown that accidents do not happen except through actual carelessness or clumsiness. In the course of his remarks Mr. Smith has to deal with many matters which incidentally arise, such, for instance, as the liabilities of masters for injuries caused to third persons by the negligence of their servants, with all the refinements which have been engrafted on this rule in the endeavour to distinguish when the servant is acting on his master's behalf and when upon his own. Another branch subject of which Mr. Smith treats in this part of his book is the evasion of liability by the employment of responsible sub-contractors, and with reference to this the author says, "Owners of real property are not liable for the negligence of 'contractors' any more than the owner of chattels, although for a long time it was held that they were." We cannot agree with Mr. Smith that the law is quite clear on the point even now, the late case of Tarry *v.* Ashton obviously recognizing a somewhat more extended liability on the part of landowners.

Mr. Smith's second head, "Neglect of duties requiring more than ordinary care," of course begins with the instances, well known from Lord Holt's famous judgment, of persons entrusted with goods exclusively for their own benefit; and, further, it includes all persons who for their own profit invite others on to their premises, follow occupations dangerous to others, engage in dangerous pursuits, or who, by the very nature of their profession or business,

* *A Treatise on the Law of Negligence.* With an Introduction and Notes, and a Supplement containing the Employers' Liability Act, 1880. By Horace Smith, B.A., of the Inner Temple, Esq., Barrister-at-Law, Editor of "Roscoe's Criminal Evidence," &c. London: Stevens & Sons. 1880.

undertake to provide a considerable amount of skill; and, lastly carriers of passengers. Carriers of goods are not included in the category, inasmuch as by the custom of the realm they are looked upon as insurers, and, in the absence of special stipulation, are liable for loss of or damage to goods entrusted to them, without any proof that such loss or damage was due to any negligence on their part. Mr. Smith admits that with regard to this branch of his classification "the language of the judges will not entirely bear out the doctrine that more than ordinary care has been demanded, the words 'ordinary' and 'reasonable' being used; but evidently" (as the author thinks) "in many cases, as meaning ordinary and reasonable under the circumstances—that is to say, more than ordinary and reasonable in ordinary circumstances." We are strongly inclined to adopt Mr. Smith's view. It would be absurd to contend that a higher degree of care and skill is not required from a surgeon who is called in to set a broken leg than from a carpenter who is sent for to mend a broken chair, or that an equal amount of precaution is sufficient for a railway company despatching an express train full of passengers, and for a man driving a farm-cart to market. Practically the care and skill must be regulated by the pretensions of the person employed or the exigencies of the situation, and this is what is always understood by juries when they are directed to decide whether the defendant has exercised reasonable care and skill. Mr. Smith goes systematically through the leading exemplars of each of the classes enumerated above, adding illustrations from many decided cases, his comments on which are invariably intelligent and valuable. He has adopted the plan of appending to the reference to each case some few words indicating its salient point, a plan which provides a useful "memoria technica" for the practising lawyer.

Contributory negligence, as disentitling an injured person to recover, is of course a most important element in any treatise on the law of negligence, and Mr. Smith devotes a considerable portion of space to this complicated subject. According to his original definition, negligence, to be a ground of action, must be the proximate cause of injury; the word "proximate" not being taken in the narrow sense as referring merely to the time when the injury occurred, but as indicating such a cause that its effect could not have been counteracted or avoided by the ordinary care of the person alleging it. Contributory negligence, then, is, according to Mr. Smith, "that sort of negligence which, being a cause of the injury, is of such a character that the defendant could not avoid the effects of it" (p. 150), and we see little to quarrel with in this definition. It satisfactorily meets those numerous railway cases in which by the negligence of a company a passenger is put to his election between danger and inconvenience, with regard to which Mr. Smith quotes, at p. 157, the admirable remarks of Lord Justice Bramwell in a recent case. We must take exception to one conclusion of law arrived at by Mr. Smith in the same page, that in case of an injury sustained by a man in trespassing on the land of another the fact of his being a trespasser does not necessarily preclude him from recovering damages. The point may not be quite clear, but the balance of authorities would certainly seem to be the other way.

We do not wish to be hypercritical, but there is one passage in Mr. Smith's work (p. 173), where he is speaking of Lord Campbell's Act, which appears to us to partake of the nature of an Irish bull. It has been held that the representatives of a person killed by negligence cannot recover the expenses of burial and mourning. Mr. Smith disputes the soundness of this decision, on the ground that "death is not absolutely instantaneous with the injury, and there must be a moment of time in which the deceased had a right of action, which (by the statute) survives to the representatives." Taking the argument by steps, we fail to see at what moment of time a man could have a right to sue for his own funeral expenses.

The last class of negligence mentioned by Mr. Smith, namely, "Neglect of duties requiring less than ordinary care," is a very small one, including only "gratuitous depositors," "gratuitous loans, in the case of the bailor," and "persons gratuitously dedicating a way to the public," the obvious foundation for the exemption from any higher liability being the accepted principle that you cannot expect much where you give nothing. In such cases all that the person conferring the benefit is bound to do is not wantonly to endanger the safety of the other party by concealment of dangers known only to himself.

Of course a good deal of Mr. Smith's book necessarily consists of old matter, inasmuch as several good treatises on negligence already exist, and the subject has been largely cut into by works on torts, carriers, &c.; but his arrangement is good, his quotations and references are apt, and he is certainly entitled to credit for the novel and logical classification of his subject to which we have referred.

A CHINESE GEOGRAPHICAL DICTIONARY.*

IN these days of book-making it is a pleasure to meet with a work which, as in the case of the volume before us, supplies, or even partly supplies, a want. There are many things in China which appear to be immutable, but the names of places are not among them. From time immemorial Chinese potentates have regarded it as their right, and almost as a part of the usual etiquette, to give new names to any places where their arms have been conspicuously victorious; and consequently at the change of each dynasty numbers of cities and towns have been re-christened at the bidding of the triumphant usurper of the throne. As upwards of thirty of these changes have taken place in the history of China, the difficulty of identifying a city existing two thousand years ago may be imagined. For instance, if we take the celebrated provincial metropolis and prefecture T'ai-yuen Fu, we find that under the Chow dynasty it was the State of T'ang; in the "spring and autumn" period it formed part of the State of Tsin; during the civil wars which followed it belonged to the State of Chaou; under the Ts'in dynasty it was known as Tsin-yang, and T'ai-yuen Kiun; under the T'ang as Pih-king, or northern capital; under the later T'ang as Si-king, or western capital; under the Sung dynasty as Ho-tung, and under the later dynasties it has been called by its present name. The student of Chinese history will therefore find this place mentioned under nine different names, and with nothing in the texts to help him to identify it. An attempt was made by M. Biot to smooth away this difficulty by the publication of his very excellent *Dictionnaire des Villes Chinoises* (1842), in which he traced some few of the changes which the principal cities had from time to time undergone, and added the latitudes and longitudes in all cases where these had been ascertained or could be approximately calculated. But the work was manifestly incomplete; the names of only the principal cities were found in its pages, and the historical portion left much to be desired. Rightly judging that the time had come when a more extended work, traced on the same lines, would be welcomed, Mr. Playfair undertook to revise M. Biot's work, and to supplement it "by a catalogue of the more important minor towns of the Empire."

The result is the work before us, which is in most respects a vast improvement on its prototype. It is fuller, containing 9,037 entries, and the historical information given is both more complete and accurate. The only advantage which M. Biot's Dictionnaire has over it on this point is that in that work in each instance the source from which the author has learnt the latitude and longitude is given; whereas Mr. Playfair leaves us in doubt whether he is speaking with the authority of the "British Admiralty charts," the calculations made at the Russian Observatory at Peking, "Dr. Williams's map of the Chinese Empire," "Johnston's General Gazetteer," or of calculations made "as carefully as possible from the Chinese Atlas." We could have wished also that Mr. Playfair had followed the example of M. Biot in using the old "mandarin" orthography of Central China for the transcription of Chinese proper names, instead of the Pekingese. The advantages in favour of the former are so numerous and important that the comparison which Mr. Playfair attempts to set up between the Langue d'Oil and Langue d'Oc of China, even if it were relevant, which it is not, need not be seriously considered. In the first place, the old "mandarin" pronunciation, that is to say, the "mandarin" of the fourteenth century before it was divided into the dialects of Peking, Nanking, and Ch'ing-tu, is that which is laid down in K'ang-hi's Dictionary, which is the officially recognized lexicon of the language. It is the one, therefore, with which every educated man is familiar, and may be said to be the literary pronunciation. It is also the pronunciation which is best known in Europe, being that which, until lately, has been employed to express Chinese proper names by every writer on Chinese matters. Further, it was not chosen by K'ang-hi for any arbitrary reason, but was adopted from the *Wu fang yuen yin*, or, "The Original Sounds of the five divisions of the Empire"—*i.e.* north, south, east, west, and centre, as representing the old "mandarin" pronunciation. It is the root from which the dialects of Peking, Nanking, and Ch'ing-tu have sprung, and from which all three, and especially that of Peking, have woefully degenerated. In all three, the very common old initial, *K*, has suffered decay; thus *k'i* becomes in Nanking *kwi*, in Ch'ing-tu *kri*, and in Peking it reaches the lowest possible degradation and appears as *ch'i*. In the capital also the initial *Ts* undergoes a like change before the vowel *i* (the English *e*), and the curious consequence follows that, in a great majority of cases, the initials *Ch*, *K*, and *Ts* are in no way distinguished by the Pekingese. One result of this is a large reduction in the number of distinct syllabic sounds; and this in the case of a monosyllabic language, such as Chinese now is, is attended with considerable inconvenience. Mr. Playfair's pages furnish abundant examples of the difficulty which thus arises. For instance, we have the town *Ts'ien-kiang* given as *Ch'ien-chiang*. In the first case the distinguishing initials help us to the meaning of the name; but without the native characters any explanation of Ch'ien-chiang would be the wildest guesswork. This is indicative of only one of the many defects of the Peking dialect, which, in a linguistic sense, is a poverty-stricken and degraded version of the old "mandarin." To a European student it has the additional disadvantage of being unknown, and dictionaries, therefore, in which it is used are apt to give rise, at all events at first, to much vexation of spirit. It will be some time before those wishing to consult Mr. Playfair's work will learn to look for *Peking* under *Pei-ching*, or for *Kin-kiang* under *Chin-chiang*, and so on. But even Mr. Playfair admits this difficulty, and attempts partly to remedy it by adding the orthography which is universally known in all cases where the name is one familiar to English readers.

With the contents of the book, as far as they go, we have no fault to find. The information under each heading is all that it professes to be, and is clearly and concisely given. It is of what the book lacks rather than what it contains that we are disposed

* *The Cities and Towns of China.* A Geographical Dictionary. By G. M. H. Playfair. Hong-Kong.

to complain. Mr. Playfair seems to imply in his preface that he was fearful of making his work larger than it is. But why should he have been? His book is intended for students, not for general readers, and to the student of history every piece of real information about a place or district is, or may be, of importance. On the other hand, it is tantalising to turn to "a geographical dictionary" for information about a place mentioned in history and not to find the name recorded, or to discover that the particular indication wanted is omitted. But such must often be the fate of those who consult the work before us. For instance, of the twelve district cities within the metropolitan prefecture of Si-ngan fu, or, as Mr. Playfair writes it, Hsi-an fu, during the Han dynasty, two, Nan-ling hien and Li-yang hien, are not mentioned. Yet they were neither of them unimportant places, and Li-yang hien was for a time the capital of Kaou-tsu, the founder of the dynasty. But perhaps the most curious omissions among localities of great historical interest are those of the two most celebrated of the four passes which are known as "the gates of the Empire," the Han-kuh kwan and the Tung kwan. Both these passes have been the scenes of fierce and repeated contests by which the fates of dynasties have been over and over again decided. When such places are passed over in silence less notorious districts are not likely to be more favoured, and it would not be difficult to make a considerable list of the towns and villages mentioned in the first few chapters of the history of the earlier Han dynasty which are not named in Mr. Playfair's pages.

These omissions are due, no doubt, to the sources from which Mr. Playfair gathered the materials for his work—namely, Biot's *Dictionnaire des Villes Chinoises*, the *Tsin-shin*, or "Chinese Red Book"; the *Ta Ts'ing yih t'ung yu t'u*, or the "Atlas of China under the present Dynasty"; and the *Lieh tai ti li chi*, or the "Political Geography of China during successive Dynasties" subsequent to the Han dynasty. These three native works are of the conventional kind, and represent the unscientific geography of Chinese writers. As yet no Imperial Geographical Society has inspired a passion for geographical research; and numerous places of great historical and ethnographical interest have been allowed to drop out of memory altogether, or, if their names are preserved, their positions are so roughly described that their identification is by no means easy. Chinese geographers deal mainly with places that exist, and trouble themselves very little about such as have ceased to be. In the same spirit, they are content for the most part to possess a knowledge only of the geography of the country beginning from the time of the Han dynasty (B.C. 206—A.D. 220), from which date the Empire became firmly established. Beyond this limit, for instance, the author of the *Lieh tai ti li chi* did not care to go; and the editors of the *Ta Ts'ing yih t'ung yu t'u* did not feel themselves bound to be very minute in their antiquarian researches. In proportion, therefore, to the neglect of those men Mr. Playfair's pages have suffered the loss of much information which is of interest and importance to students. Under the heading Ting-t'aou, for example, we have no mention of the fact that that place was anciently known as T'ao, and was for a time the abode of the "all-informed, intelligent, accomplished, and thoughtful" Emperor Yaou (B.C. 2356-2255), who took his sobriquet of T'aou-t'ang shi from it and the town of T'ang, where he had previously resided. The traces, also, of the aboriginal tribes which are to be discerned in the names of modern cities and districts are well worthy of study. Mr. Playfair tells us that the Fei-ch'ing hien of the present day was originally the Fei-tsze kingdom; but he leaves us to discover for ourselves that the Fei-tsze were an aboriginal people and an offshoot from the Tek tribes, the ancestors of the Tekke Turcomans. Of the language of these tribes we have occasional indications in the old names of places, as in the case of Lu-nu, the city which is now known as Ting-chow, in the province of Chihli. It derived its name, so say old historians, from the existence of a stagnant pool of black water, *Lu* meaning black, and *nu* stagnant water, in the Tek language. This *nu* recalls to us the Egyptian *nu*, "the water of chaos," and reappears in Menam, "the mother of waters," the name of the great river in Cochin China. The *Lu* we find as Lo, "black," among the Miaou-tsze tribes of South-Western China. In *Kiaou-chi*, the old name for Cochin China, we have preserved a record of a curious physical feature peculiar to the people of that country. Travellers tell us—and the name Kiaou-chi, "crossed toes," confirms the statement—that among the Cochin Chinese the great toe, as a rule, overlaps the next one to it. Hence the name. But, as is the case all over the world, the names of a great majority of the provinces and towns in China are suggested by their geographical position. For instance, the provinces *Shan-tung* "east of the mountains"; *Shan-si*, "west of the mountains"; *Honan*, "south of the (Yellow) river"; *Hu-nan*, "south of the lakes"; and such places, *Kiu-kiang*, "nine rivers"; *T'ientsin*, "the heavenly ford"; *San-shwuy*, "three waters"; all point to their geographical positions.

In fact, a very interesting book might be made of a Gazetteer of China in which the historical, ethnological, and geographical facts embodied in the names of places should be collected. We commend this suggestion to Mr. Playfair, who, by the arrangement of the materials he has gathered together in the work before us, has shown that he is well qualified for such a task. We are convinced that a work containing an amplification of the nine thousand and thirty-seven entries which he has given us, with the addition of twice as many more, though it might be of a size such as at present alarms him, would be welcomed by students of Chinese history.

JUST AS I AM.*

"MANY a man," says De Quincey, "traces his ruin to a murder of which perhaps he thought little enough at the time." The great moralist goes on to follow the gradual fall from righteousness which, beginning with an unconsidered murder, ends in Sabbath-breaking and positive discourtesy of manner. In Miss Braddon's new novel we are permitted to see how the influences of high birth and a sound education can arrest a career of vice in its very beginning, and keep a baronet who has been a murderer in the way he should go. Sir Everard Courtenay had assassinated Walter Blake, not indeed without provocation, but with every circumstance of premeditated guilt; yet the offence had no evil effect on his urbane and deeply religious character, or on his private fortunes. Ordinary murderers generally suffer a good deal from remorse, are not infrequently detected, and are occasionally hanged. But the Baronet, for at least twenty years after committing his dastardly crime, appears to have lived a quiet but happy life, secure in the affection of an only daughter, and occasionally "whipping romantic trout streams" in Wales. It is true that he was found out in the end, and when he began to be found out he began to be uncomfortable. Still, when he confessed to the amiable curate who wished to marry his daughter, and even when he admitted that he had allowed another man to be condemned to penal servitude for his crime, the curate only felt "deeply sorry" for the Baronet. And, after marrying his daughter happily, and becoming an interesting invalid, the Baronet retired for the last few months of his existence to La Trappe. He had previously (in spite of De Quincey's theory) been a very regular churchgoer at home. On retreating from the world he sought refuge in the arms of the Catholic Church; and he died, after a prosperous and respectable existence, in the odour of sanctity. Every one who was aware of his crime said, "Poor dear Sir Everard, he has suffered much," or words to that effect.

We doubt whether silly novels do all the moral harm that critics sometimes ascribe to them. Any young person who reads Miss Braddon's new tale will learn that a bride, a lady of the sweetest nature, may carry on a clandestine love affair with an interesting widower just when she is on the very point of becoming a mother. This was the almost imperceptible blot on the character of poor young Lady Courtenay. The widower, too, being the soul of honour in other respects, may make love to his friend's bride, and, when confronted by her angry husband, may refuse to give him any but legal satisfaction. In expectation of such a refusal, the injured husband, Sir Everard, may "pluck a stake out of a hedge—a heavy, murderous-looking stake, with a sharply-pointed end"—and therewith may deliberately batter in his false friend's skull. And, in spite of all this infamous treachery and deliberate villany, all three characters may be highly respectable persons, deserving rather of pity and sympathy than of human censure. These facts the reader may learn from *Just as I am*, and yet we doubt whether his or her moral tone will be greatly lowered by the lesson. Nature has planted in most of us a kind of instinct which recoils with honest hatred and horror from the vices and crimes of these polite sinners. We know perfectly well that if Sir Everard had felt a grain of real remorse he would have done what he could to expiate his crime by giving himself up to justice. And the infamy of the conduct of his friend and his bride are so manifest that the reader must be weak-minded indeed who bestows on them a maudlin pity. Human nature is not so silly as to be seduced into either murder or adultery by the leniency with which Miss Braddon treats these peccadilloes in the persons of her new novel.

What interest there is in *Just as I am* is inevitably spoiled by an analysis of the story. Yet without this analysis it is impossible to display the nature of the characters to whom we are introduced, and of their very disagreeable relations to each other. The tale begins with the appearance of one Humphrey Vargas, a tramp who has reached the end of his luck. Vargas, and Vargas's dog—an outworn, starving, shambling, and deeply attached couple of wanderers—are very well described; and there is a good deal of unstrained pathos in the old fellow's love of his lurcher. Just on the twentieth anniversary of the birth of the heroine, Dulcie, daughter of Sir Everard Courtenay, Vargas gives himself up to that justice of the peace as the murderer of one Walter Blake, who had been slain on that very day, twenty years before. Now the son of Walter Blake, Mr. Morton Blake, is Dulcie Courtenay's affianced lover, and is in the house when Vargas gives himself up. Morton Blake is described as an intellectual and ambitious young Radical; but in all the earlier part of the tale he appears only as an incarnate spirit of revenge on his father's murderer. He is annoyed with Sir Everard for disbelieving Vargas's confession, and circumstances gradually lead him to suspect the Baronet himself. Walter Blake had been found dead and robbed in a ditch on the path by which he was riding home from hunting. At the moment of his death his son Morton had been ten or seven years old (the author gives both ages, Vol. I. pp. 29, 93), and the lad had never forgotten the horrors of the event. At Vargas's trial, however, his counsel had hinted that Walter Blake had once been the suitor of the lady who became Sir Everard's wife. He had also proved that the blow by which Walter Blake was killed must have been inflicted, not with a rounded cudgel, as Vargas said, but with a

* *Just as I am.* By the Author of "Lady Audley's Secret." 3 vols. London: Maxwell & Co. 1880.

sharp-edged stake. These things stimulated Morton Blake's suspicion, and his aunt, his father's sister, who knew that her brother had behaved treacherously to Sir Everard, confirmed his doubts by her reserve. He at last ventured to ask Sir Everard whether the friendship with his father had been unbroken. This was too much for Sir Everard: he gradually made Dulcie break off her engagement, and much unhappiness and brain fever were the result.

Meanwhile Morton had not been alone in his inquiries. The daughter of Vargas, anxious to clear her father's character, had discovered a groom who had been in Sir Everard's service, and had picked up a spur of his on the scene of the murder. The reader begins to think that Sir Everard is going at last to be punished for his offence, but Morton's heart is softened, and he actually listens to the confession of the Baronet: "I meant to kill him, foully or fairly." Immediately after the murder Lady Courtenay gave birth to her daughter Dulcie, and died. There is something particularly horrible in the idea of a love affair between the daughter of the murderer's wife and the son of the murdered man with whom the wife had been intriguing. Attempts are made, indeed, to suggest that the affair between Walter Blake and Lady Courtenay had stopped short of actual guilt. But Walter Blake's remark that Sir Everard "might as well try for a divorce" looks the other way. The author has succeeded in devising a situation which has suggestions that might tempt M. Zola to covet his neighbour's copyright. The confession of Vargas, it should be said, had been made from a variety of motives, and chiefly because "such a life as his was not worth living." It was true, however, that Vargas had robbed the dead body of Walter Blake. By way of showing the author's leniency, it is enough to mention the curate's remark on this affair of Vargas. The curate, *vice* Morton Blake cashiered, is engaged to Dulcie, and has heard Sir Everard's confession:—

> "My dearest, he has confided in me—he has told me all."
> "All?"
> "Yes, he has told me the dark secret of his life—and I am deeply sorry for him."
> "Sorry for him?—yes, one cannot help being sorry for him. What must I feel, who have loved him and been loved by him all these years? But will God have compassion upon him, as we have? Can his sin find pardon?"
> "It can, it will. If he is sincerely penitent, as I believe he is, God will assuredly pardon."
> "But to let that innocent man suffer—was not that a terrible sin?"
> "It was a sin, but I do not believe your father would have let his life be sacrificed had there been no commutation of his sentence. Remember, the penalty Vargas actually paid was only the just punishment of his actual guilt."
> "How good you are! What a load you have taken off my mind!" said Dulcie. "Yes, I know he is penitent. Twenty years of sorrow! That is a long atonement, is it not?"
> "God will accept that atonement, love.'

This was the view of the representative of the Church. Yet it seems odd that imprisonment till death should not be too much for a tramp who has robbed a dead man, while "twenty years of sorrow" is penalty enough for a baronet who has committed a murder. Since Mr. George Macdonald tried to interest us in a scoundrelly undergraduate "of beautiful nature" who had murdered a girl and lived on opium, we have not met with such maudlin morality. Yet even in Mr. Macdonald's novel the beautiful-natured young murderer was warned by the parson that he must give himself up to justice if he wished his repentance to have any value. In Miss Braddon's story the parson and the murderer's daughter pass straight from discussing the paternal sin to love-making, and Dulcie says:—

> "I love you dearly, though I hate myself for being so horribly fickle. Are you not afraid of marrying such a weathercock?"
> "I fear nothing but my own unworthiness, Dulcie. You have made me unutterably happy."
> "Please don't despise me," she murmured softly; "but I'm afraid I love you better than ever I loved Morton."

So the murderer gave away his daughter, and a bishop united the happy pair, and they planned a visit to "papa" next winter, and a comic Irishman interrupted the wedding-breakfast.

We do not know what the confirmed novel reader may think of this plot and of these persons, but to ourselves they appear extremely distasteful. There is something in murder, even under provocation, that we cannot look on as a trifling and venial error. This complaisance of the parson's is carried too far for mere Christian tolerance. The other characters and the by-play of the novel do little to reconcile us to *Just as I am.* Two or three sets of vulgar people, rejoicing respectively in pretentious vulgarity, in slipshod middle-class vulgarity, and in the vulgarity of factory hands, are described with good-humoured truth. The author is only too good-humoured—that is precisely the fault which we find in her theory of murder. Another character is a pretty but rather luckless Lady Frances Grange, who falls in love, uninvited, first with Morton Blake, and then with the old murderer himself. But she is not inconsolable, and is left "hobnobbing over Beville's sandwich case and sherry flask" with "a certain wealthy lordling." The wretched Morton is once more fallen in love with by another spontaneous admirer, Miss Lizzie Hardman, who leads him to the altar. In fact, Miss Braddon's young ladies are in as "coming on" a humour as the heroines of the old French metrical romances. The Baronet plainly tells Lady Frances that, if he had been a good man, he should have asked her to be his wife, and she replies, "I can trust you and be happy with you whatever you are." But the Baronet, having his eye on La Trappe, declines this hint. "His life is now of the severest kind," and he rises, poor fellow, "at two every morning."

If Sir Everard Courtenay's name had been 'Arry Jones, and if he had knocked in his friend Bill Smith's head with a stake, and then let another man bear the punishment, we doubt whether the author would have been so tenderly interested in his fortunes. Even though he was an amateur of book-binding, we admit that he only rouses disgust and indignation as we think of him. Generally novelists are pretty hard on their wicked baronets, and Miss Braddon may have wished to show that, though a baronet in a novel must be a murderer, he need not be a coarse noisy one, like lost Sir Massingberd. But she has failed, we think, to create a character with whom even her public will sympathize. The name of her novel, borrowed, we fancy, from a hymn, has given much concern to serious circles. This concern can hardly be diminished by the moral lessons which seem to be implied in *Just as I am.*

GERMAN LITERATURE.

NOT many sovereigns have deserved better of their people and the world than the Emperor Akbar (1), one of several proofs worth bearing in mind during the present break-up of the Eastern world that Turkish blood and Arabian religion are not necessarily incompatible with the highest desert on the part of a ruler. The cause of the chronic misgovernment of Eastern countries seems rather to consist in the impossibility of controlling a bad sovereign than the inability to produce a good one. Although Count von Noer's history of Akbar has not proceeded very far, it has gone far enough to show how largely his accession to the throne depended upon the mere fortune of war, and consequently to what degree the happiness of his empire was staked, not merely upon the good sense, but also upon the good luck, of a single person. One thing even Akbar could not do—he could not ensure his subjects a successor like himself; and it is thus very possible that, from the force of contrast, his virtues have gained him a higher place among sovereigns than he would have merited if his lot had been cast in Europe. Be this as it may, Count von Noer has selected an admirable subject, for which he appears to have every qualification except that of animation or dignity of style. To these he cannot lay claim; but, if his sober narrative is not lively or alluring, neither is it dull, and it at all events displays that kind of ease which springs from a complete mastery over the original sources of information, so far, at least, as these are accessible in translations. Fortunately these are the most important, including Ahmed Bachschi's history, as translated in the valuable collection of Elliot and Dowson; the Akbar Nameh and Ayeen Akbar of Akbar's Vizier and panegyrist, Abul Fazl; and the Muntachabut Tawarich of his detractor Badaon. Mainly from these sources Count von Noer has prepared a lucid narrative which bids fair to fill up a perceptible blank in European historical literature. The first part is principally occupied with the political troubles of Akbar's earlier years down to 1567; the far more interesting history of his internal administration being reserved for subsequent volumes. A useful preliminary sketch of the country and people of India is prefixed.

General Bogdanovitsch's account of the Russian Guards' share in the operations before Plevna (2), especially the capture of the redoubt of Gorni-Dubniak, is more spirited and less technical than is usually the case with strictly military histories. The author's estimate of the military qualities of his troops is very high, but no doubt well merited. At the same time it seems pretty clear that, had the Turks been led by European officers, although Plevna might still have been taken, the garrison would not have been taken along with it.

The history of the German Bund (3) as constituted in 1816, is far from a brilliant one in itself, and assuredly shines with no factitious lustre in the pages of Herr Fischer. Although a bitter adversary of the defunct institution, Herr Fischer nevertheless pays it the involuntary compliment of considering it not so utterly bad that some one may not conceivably wish for its restoration, the rather as the new institutions, he admits, have failed to give universal satisfaction. He thinks, however, that they are capable of development until all the national aspirations are fully attained, and that meanwhile his countrymen will be the better reconciled to them by being reminded of the utter impotence of the old Bund except as a barrier against Liberal thought and an incubus on the national life generally. With so decided a *parti pris*, Herr Fischer is not likely to take rank as an impartial or a standard historian; but his estimate of the Bund is probably not very wide of the truth, and his sketch of its constitution and of the legislation achieved under its auspices is useful and interesting. There is more room for party spirit in his account of the diplomatic action of the Bund and its relations to the internal affairs of its own members; but, on the whole, there

is no great reason for dissenting from his view of the institution, which, under the guise of promoting, was established to prevent the unity of Germany.

The relations of the Hanse Towns to the Scandinavian kingdoms (4) in the fourteenth century afford an interesting but obscure subject of research. When not actually at war the parties were generally occupied by financial and commercial disputes, which Dr. Denicke has done his best to render intelligible.

A series of "Historical Studies," edited by W. Arndt and others (5), promises to throw considerable light on the more obscure portions of Germany history. The first number is devoted to an account of the work of Wido, Bishop of Ferrara, an adherent of the Antipope Clement III., against Hildebrand's claims to the Papacy. It is remarkable that Hildebrand's case is so fairly put by his antagonist as to have led some to suppose Wido to have been in fact his concealed partisan. The second number contains the history of Günther von Schwarzburg, the unsuccessful competitor of Charles IV. for the Imperial crown.

A new statistical annual, edited by Dr. J. Minoprio (6), promises to develop into a publication of importance. The economical department is that which the compiler has had more especially in view; and the financial, industrial, and commercial statistics are in most instances apparently very full. The German Empire has naturally received particular attention. Many items are given which one would not have expected to find, such as the names of banks in Italy and the number of booksellers in Switzerland. Other matters, not strictly economical but still bearing on the subject, and which might easily have been ascertained, are omitted, such as the strength and cost of the regular military establishment in all countries. The accuracy of some minor details seems questionable. It is mysterious to us how the compiler should have been able to determine that the population of the Chinese province of Fo-kien is neither more nor less than twenty-two millions seven hundred and ninety-nine thousand five hundred and fifty-six; and we are quite at a loss how to reconcile his statement that the Honduras Government devotes half its revenue to the redemption of its debt with the current Stock Exchange price of that insecurity.

Agrippa (7), according to Pliny, placed a colossal map for public inspection in Rome, embodying the most accurate geographical knowledge of his time. From an examination of the principal mediæval maps preserved to us, Dr. Philippi is led to conclude that they imply a common original extant before the end of the fourth century, and he further thinks that this may have been the map of Agrippa.

Dr. Karl Benrath, whose Life of Bernardino Ochino is one of the most important of recent contributions to the history of the Reformation, has performed another most acceptable service by the republication of the anonymous "Sum of Holy Scripture" (8), a work widely circulated in its own day, and full of freshness and interest even now. It appears to have been most widely influential in England, where at least five editions were published, and in Italy, where it excited the most deadly animosity of the ecclesiastical authorities. The original text, however, was neither English nor Italian, and after a careful inquiry Professor Benrath decides that it was in all probability Dutch; partly on account of the reference to convents of Sisters of Charity, which at that time existed only in the Netherlands. This conclusion is further corroborated by the authority of Anthony à Wood. The authorship is quite uncertain. Dr. Benrath hesitatingly conjectures that the book may be from the pen of a minister named Bommelius, who, more than thirty years afterwards, mentions that he had composed a work with a very similar title. It appears, however, that Bommelius had only been admitted to priest's orders in 1522, and the treatise certainly seems to denote greater maturity of mind than could well be expected from a person presumably so young. The tone of the little treatise is in every sense of the term evangelical; the diction is clear, spirited, and in every way adapted for popular perusal even at this day, uncompromising and occasionally vehement, but free from railing and rancour. The kernel of it is the assertion of the doctrine of justification by faith alone, with respect to which the author's position is entirely Lutheran. Transubstantiation is hardly alluded to, and the writer's attitude is in many respects more conservative than it would probably have been at a later period of the controversy. Monastic vows, for instance, are not wholly discountenanced, although their abuses are severely condemned, and the suggestion is made that they should be forbidden to persons under the age of thirty.

Dr. von Schulte's history of the literature of ecclesiastical law in Germany and Austria (9), although but an extract from a larger work, is still a book of considerable compass and importance, and a good deal more than a mere bibliography. Short biographical notices of the various authors are given when their lives present any particulars of interest, and they are sometimes accompanied with criticisms on their labours. One especially useful feature of the book is the full treatment accorded to the living jurists of Germany.

The late Professor Beck's lectures on the pastoral theology of the New Testament (10) show fervour conjoined with good sense, and a remarkable talent for enlivening and diversifying the subject.

Dr. Hugo Weiss's bibliography of David (11) is to some extent an apologetic performance; but the writer has judiciously not allowed discussion to prevail over narrative. If in some respects more of an advocate than an historian, and if disposed to pass much too lightly over his hero's questionable actions when anything like a supernatural sanction can be pleaded for them, his view is nevertheless nearer the truth than that of the writers whom he principally controverts, and his narrative is enriched by constant references to the results of modern research in history and philology.

It is hardly probable that the claims of Smyrna to be the birthplace of Homer ever obtained an impartial hearing at Colophon; and it may be suspected that the scarcely less celebrated controversy respecting the authorship of the "Imitatio" owes much of its obstinacy to national feeling and the prepossessions of religious communities. It is most natural that Dr. Cölestin Wolfsgrüber (12), as a Benedictine, should vindicate the claim of Giovanni Gersen, who was undoubtedly a Benedictine too, if he ever was anything. One serious impediment in Gersen's way has always been the difficulty of proving his existence. We are unable to discover that Dr. Wolfsgrüber has made any addition to the testimony already extant. The personality of Gersen, his dignity as Abbot of Vercelli, and his authorship of the "Imitation" still rest, as they always have rested, upon the assertions of anonymous copyists two centuries after the date at which he is supposed to have flourished. Admitting, however, his existence early in the thirteenth century, his utter disappearance from observation for so long a period is only less destructive of his case than absolute proof that he never lived. During the thirteenth and fourteenth centuries not a single authenticated manuscript of the "Imitatio" can be produced. Towards the middle of the fifteenth century manuscripts become exceedingly numerous. What conclusion is possible, but that the book was composed about that time? And, if so, the more satisfactorily Giovanni Gersen is proved to have flourished two centuries earlier, the more irresistible is the inference that the "Imitatio" is not his work. While making the most he can of the slender evidence available on his own side of the question, Dr. Wolfsgrüber renders no justice to the strong points of his opponents' case. He takes no notice of Dr. Hirsche's remarkable discovery that the manuscript of 1441 is punctuated by Thomas à Kempis's own hand in a manner which, in the opinion of many, decisively proves the identity of the copyist and the author. He gives with apparent fairness a list of the Germanisms supposed to be recognized in the Latinity of the "Imitatio," but omits all reference to the far more striking Belgicisms pointed out by Malou, which demonstrate, if anything can, that the writer was not merely a Teuton, but a Netherlander. Any palæographic evidence on his own side appears good enough for him, and he does not seem to suspect the condemnation tacitly involved in a reliance upon palæographic verdicts now two centuries old, which, so far as can be discovered, no palæographer of reputation has confirmed since.

It is to be regretted that the late Professor Cybulski's meritorious lectures on the Polish poetry of the nineteenth century (13) were not prepared for the press by himself. In this case we should probably have had a compact manual instead of a number of diffuse orations, perfectly in their place as addressed to a class of Polish students, but much too copious for the patience of a public that is but too prone to ignore Polish literature altogether. A considerable part of the work, for example, is occupied with a criticism of the Messianic hallucinations of the great Polish poet Mickiewicz, legitimate and seasonable at the time, but interesting to no one at this day. Cybulski's remarks on Panslavism have a more permanent value, and indicate clearly why patriotic Poles refuse their sympathy to this specious disguise of Pan-Russianism. The more strictly literary criticism appears to be in general sound and good. It cannot be a matter of surprise that the author's high estimate of the poets he characterizes is rarely borne out by the obviously inadequate translations. With every drawback, these pages still afford sufficient evidence of the indestructible vitality of Polish literature and of the national feeling which underlies it. Cybulski himself was a native of the Duchy of Posen, who, having emigrated to join the insurrection of 1831 in Russian Poland, paid for his patriotism by three years' imprisonment in Russia after its defeat, and six months' further confinement in a Prussian fortress after his return. Having thus acquitted his military obligations to his country, he devoted the rest of his

life to the comparative philology of the Slavonic languages, and the diffusion of a knowledge of Polish literature among Prussians and Prussian Poles, ultimately obtaining a chair in the University of Breslau, where he died in 1867.

Homer's Golden Chain (14) was an alchemical book which Goethe mentions having studied together with Fräulein von Klettenberg. Herr Kopp, the historian of early chemistry, investigates the probable signification of the title, and informs us that the work was published in 1723, and republished as late as 1781 under the designation of *The Ring of Plato.* The author was probably an Austrian physician named Kirchberger.

Herr Jean Bernard's selections from the mediæval poetry of Germany (15) are judiciously made, and, being mostly brief, are well adapted to be remembered by the scholar, and to accustom the student to the archaic vocabulary and grammar with which he must grapple. The quaint type, however, although from one point of view well matched with the crabbed text, is so trying to the eyes as to create a serious and needless impediment to the student.

The "Saint" of C. F. Meyer's romance (16) is Thomas à Becket. The author has sufficient talent and historical knowledge to depict the period with accuracy; but he has not sufficient imagination to vivify his picture, and his well-written story is in general somewhat tame.

The most generally interesting contribution to the recent numbers of the *Russian Review* (17) is an analysis of the correspondence of Catharine II. with Baron Grimm, recently published by the Academy of History at St. Petersburg. When it is stated that this correspondence lasted twenty-three years, and that Catharine's share of it, which is the only portion published, fills 700 pages octavo, some idea will be formed of its extent and interest. It appears to represent the great Empress in general upon her most favourable side, as a kind and considerate friend, a munificent patron, and endowed with a remarkable cheerfulness and equanimity of temperament. In this respect, as well as in her literary amateurship, she presents a striking analogy to her great contemporary Warren Hastings, but her taste and performances in literature were much superior to his. Her references to the French Revolution, even in its earliest stages, show that her acquaintance with philosophers had failed to give her the slightest idea of constitutionalism, and that she only comprehended government as an enlightened despotism. From this point of view she speaks of her efforts to improve the condition of her own people with a legitimate pride, though it is clear that she greatly overrated their success. Her references to her contemporaries are frequently by no means flattering, but her dislike is devoid of rancour, except perhaps in the case of Gustavus III. of Sweden. Another very interesting paper is that by Professor Schulze in support of Stephani's theory of the late and barbarous origin of the objects discovered at Mycenæ by Dr. Schliemann. Many ingenious arguments are adduced, but there is no attempt to meet the great difficulty of the entire absence of the coins and other objects of unquestionably recent date which a plundering horde under the later Roman Empire could not have failed to leave behind it.

The most important contribution to the *Rundschau* (18) is one on a Russian subject. Under the title of "The Precursors of Nihilism," an anonymous writer, who will easily be recognized as a former contributor to this periodical, gives an account of the conspiracy of Potraschewski in 1848, mainly founded on the official report, the greater part of which is cited. The plot was socialistic, and may be regarded as a symptom of a revolutionary ferment among the half-educated classes of the Empire, although it was as yet far from having assumed the portentous features of Nihilism. Theodore Storm is one of the best German writers of novelettes, and his "Senator's Sons," a story of old German times in an old German seaport, promises to rank among his best efforts. Heyse's translations of Manzoni's sacred odes and hymns are admirable in point of form, although the poems themselves are more remarkable for style than substance. Some juvenile letters of the philologist Hase, a German long domiciled in Paris, graphically describe his journey thither in the days of the Consulate. The French people were then at the height of good humour with their recent victories and the improvement in their social condition effected by the Revolution, and still considered themselves sound Republicans, but Hase remarked that the appellation "citizen" was everywhere dying out.

An unintentional inaccuracy occurred in the review of the "Dictionary of Christian Antiquities" which appeared in our last number. The author of the essay on Money is not, as we said, "Mr. Keary, of the British Museum, assisted by Mr. Babington," but Mr. F. W. Madden, assisted by Mr. Keary and Dr. Babington.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, *including postage to any part of the United States, is* £1 10s. 4d., *or* $7 58 *gold, and may be forwarded direct to the Publisher,* Mr. DAVID JONES, *at the Office,* 38 *Southampton Street, Strand, or to* Mr. B. F. STEVENS, *American Agency,* 4 *Trafalgar Square, London. THE GOVERNMENT AND THE ANARCHISTS.

MR. PARNELL announces that, in consequence of the intended prosecution, he will no longer deprecate murder or violence. If it had been true that he had at any time attempted to check the crimes for which he is morally responsible, his present declaration would be an admission that he was henceforth a willing accomplice of assassins. He has, in fact, never expressed the faintest objection to the proceedings of his disciples except in the form of occasional denials of the necessity of murder. Any adherent of the Land League who differed from Mr. PARNELL as to the need of killing a landlord might quote his authority in support of the principle that all measures required for the expropriation of landowners are intrinsically justifiable. A speaker who followed Mr. PARNELL said without remonstrance on the part of his leader, that if tenants were to shoot landlords like partridges in September, he for one would never object. To give practical point to his doctrines, the orator proceeded to denounce a particular land agent by name; and the audience, as might be expected, cried out that he must be shot. Perhaps the most offensive incident of a meeting remarkable for its violence was the production of a letter from the Roman Catholic Bishop of the diocese, confirming the allegation that the tenant-farmers suffer intolerable grievances, and ending with a sanctimonious warning against any deviation from the paths of justice and morality. An exhortation to shoot landlords like partridges may be more wicked than a formal protest against a deviation from morality in the form of murder; but it is perhaps less contemptible. The Church which on the Continent affects to be the great bulwark against anarchy, has, either through complicity or through cowardice, scandalously failed in the duty of resisting the lawlessness of its devotees in Ireland.

As the conspiracy becomes daily more formidable, stronger doubts are entertained as to the wisdom of the Government policy. In the most favourable event of a verdict for the Crown, the chief ringleaders will be sentenced to various terms of imprisonment; and some of them perhaps will not be sorry to find themselves in a safe retreat at the moment when they might otherwise be expected to head the insurrection which they have done their best to prepare. Their places will be instantly filled by ambitious substitutes, glad of the opportunity of acquiring notoriety in their turn. The extravagant language of their principals will be, if possible, exceeded, in the well-founded confidence that the elaborate machinery of a State prosecution will not be employed repeatedly or against obscure offenders. In the meantime the outrages which embody the purpose of incendiary speeches will increase in frequency and atrocity, and the combination against payment of rent may probably spread through the whole of Ireland. The assumption that an honest verdict will to a certain extent vindicate the supremacy of law is, by general acknowledgment, more than doubtful. The jurors will, even if they are upright and loyal, need courage to defy the intimidation to which they will be exposed. Modern Liberal legislation has succeeded in deteriorating the jury panels, which consequently inspire little confidence, even when no political issue is raised. A Dublin jury will probably not acquit the defendants in the teeth of sufficient evidence; but a single dissentient, through sympathy or through fear, may secure impunity to the accused. After a first failure, ultimate success would become more improbable, and a second trial would produce intolerable delay. While no good subject would willingly impede the action of the Government, Mr. FORSTER may be surprised to find that the prosecution is but faintly approved either by his supporters or his opponents. One section of the party perhaps still sympathizes with the objects, though not with the methods, of the agitators; but the objection to an appeal to the criminal law in which Conservatives and moderate Liberals concur is that the remedy is too weak for the disease. The arrest and intended prosecution of HEALY, who is called Mr. PARNELL's secretary, results from an information laid by a tenant-farmer whom he had publicly threatened with outrage. The same agitator denounced to an excited meeting by name Mr. HUTCHINS, whom the voluntary auxiliaries of the Land League had already attempted to murder. It will be interesting to learn whether conviction for a crime which cannot be adequately punished is possible in the present state of Ireland.

As the preparations for the trial for conspiracy will take some time, it is to be hoped that the Government will not obstinately bind itself to abstain from the simultaneous employment of more stringent measures of precaution or defence. Two provisions of former Coercion Acts are urgently required. The Habeas Corpus Act ought to be suspended, and the disaffected population should be as far as possible disarmed. It is at least impossible to understand any objection which could be raised to the prohibition of the sale of arms. The most pedantic and puzzle-headed of constitutional puritans could scarcely persuade himself that the acquisition of instruments of murder is a sacred and indefeasible right. A Government which has not courage to prevent the sale of rifles and bayonets that are to be used against itself and against the peaceable part of the community must be almost too imbecile for contempt. A correspondent of the *Times* has published a curious illustration of the extent to which factious selfishness may deter a Government from the performance of the plainest duty. In 1846, when murder and violence were almost as rampant as at the present day, Lord JOHN RUSSELL, who had just succeeded to office by a discreditable coalition with Lord GEORGE BENTINCK against Sir ROBERT PEEL's Coercion Bill, would have allowed anarchy to continue unchecked, if Lord CLARENDON had not threatened to resign his office of Lord-Lieutenant unless he were armed with the necessary powers. In the present year the new Government deliberately refused to renew the Peace Preservation Act; but the consistency of Ministers is on the whole less important than life and property. There seems to be no reason why a prosecution for breach of the ordinary law should interfere with an application to Parliament for exceptional powers. Even if the two modes of proceeding were deemed incompatible, it is a more urgent duty to deal directly with anarchy and sedition than to punish past offences. It may be an interesting experiment to try whether the law which is openly and systematically defied is really powerless; but the business of statesmen is not to solve speculative problems, but to protect the community. Even if the Ministers were incapable of thinking of any interests except those of themselves and their party, they

would be well advised in trying to resume the abandoned task of governing Ireland. Their countrymen prefer the safety of society to the sanctity of constitutional cant.

Notwithstanding the common form in which official speakers recite their abhorrence of extraordinary legislation, only the enemies of order and justice and the sympathizers with the Land League doubt the expediency of silencing the demagogues, and of locking actual up or intending murderers, if it is impossible to convict them. If landlords are placed by modern Jacobins outside the pale of the law, poor tenants who may have offended against the agrarian code have some claim to compassion. Like ancient Oriental conquerors, Mr. PARNELL'S virtuous clients punish women and children for the offences of culprits who have ventured to pay their rent. The perpetrators of outrages are not unfrequently known, and the more deliberate murders are generally committed by hired assassins from a distance. In former years of disturbance it has been found that the imprisonment of a few persons reasonably suspected has almost put an end to crimes of violence in a district. It is of course possible that in some cases supposed criminals may be unjustly accused; but there is not the smallest risk of intentional injustice, or even of frequent mistakes. If an innocent person by some infrequent error were to suffer a short imprisonment, his sufferings would be more tolerable than the tortures inflicted by the disciples of the Land League on contumacious tenant-farmers. In the Cabinet Councils which are about to begin, the state of Ireland will be the most pressing subject of consideration. The Ministers, as Lord CLONCURRY observes in his letter, will incur a grave responsibility if they decline to provide themselves with the powers which are by universal consent urgently and immediately required. It is scarcely possible that they should in present circumstances revive Mr. FORSTER'S ill-judged threat of a Disturbance Bill to be used as a set off against a Peace Preservation Act; yet Mr. CHAMBERLAIN'S language at Birmingham is not a little alarming. The recent agitation and the atrocities by which it has been accompanied are not, even by the demagogues themselves, attributed to oppressive evictions. It is on behalf of the tenant who remains undisturbed in his holding that the Land League claims perpetual possession and exemption from liability to payment of rent. There is no longer any pretext of agricultural distress to be used in excuse of irregular and unconstitutional projects of legislation. The impartiality which places on an equal footing the wrongdoer and the victim will not now be plausible or popular. It would seem that the rupture between the Government and Mr. PARNELL is complete, as he has resorted to the coarse practice of O'CONNELL by giving Mr. FORSTER a foolish nickname. Perhaps the trodden worm will turn, though it declined to resent worse injuries inflicted on other sufferers.

AFGHANISTAN.

THE report of a new rising in Cabul and of the murder of the AMEER has not as yet been confirmed. On the other hand, the Government is not in a position to formally contradict this report. All that appears to be known is that on the 16th—a fortnight ago—things were quiet at Cabul. Communication with Cabul is so completely suspended that the Indian authorities know nothing of what may take place there until, at any rate, many days have passed. All that can be said is that the report comes from a quarter which has shown itself on other occasions to be exceptionally well informed; and, as experience has shown, intelligence is spread through the native population in India in some mysterious manner, and with a rapidity which outstrips the imperfect means of European communication. Still, it must be said that, if the events took place at the date at which they must have taken place for the intelligence to have reached Lahore through any secret channel, enough time has now passed to make it strange that none of those who would have been endangered by an insurrection should have made their way to the shelter of the British lines. The balance of probability is therefore, perhaps, against the report being true; and we may hope to hear that ABDURRAHMAN is at this hour as firmly established at Cabul as he ever was. But every one who heard the report in England at once felt that there was nothing impossible or intrinsically improbable in the report. An insurrection and the murder of the reigning prince are incidents in the history of Cabul so familiar and frequent that there was nothing extraordinary in their befalling the last new man who has set himself up there. And if the report was assumed to be true, it was natural to ask whether we had been wise in giving up so quickly our hold on Cabul, withdrawing all support from the AMEER of our choice, and leaving him to take his own chance. A little reflection will show that, even if the AMEER had been overpowered and murdered, his fate would have been no argument against the wisdom of the policy adopted. If we had chosen, we might, by a sufficient expenditure of life and money, have annexed, not only Cabul, but all the dominion formerly belonging to SHERE ALI. We decided against annexation; and if Afghanistan was not to be annexed, it must be left to itself. A chief had to be found who offered a fair promise of being able to hold his own as a native independent prince. When we found such a man as ABDURRAHMAN we had to take care that he should be at once invested openly with the character which he was ready to assume, and which we wished he should assume. An independent Ameer under the guard of English guns is a contradiction in terms; and every day we remained at Cabul would have strengthened the impression that ABDURRAHMAN was not an Afghan chief, but one of those wretched pocket-princes of the English who are sure to perish the moment they are left to themselves. To have guarded ABDURRAHMAN for some months more and then left him would have been to have given him not a better but a worse chance. It was only by being regarded as really independent that he had any prospect of not being overpowered and murdered; and if, after all, fortune has gone against him, we shall at least have the satisfaction of having placed him in the only position which could give him the possibility of a better fate.

General PRIMROSE has at last told the story of the sortie from Candahar of the 16th of September. Why the sortie was made, what it was supposed that it could do, and what good it had done, were all puzzles awaiting the solution which no one but the General in command could give. General PRIMROSE now tells us the general result. The sortie was a brilliant success. He also tells us how that brilliant success was obtained. It was won by sending British troops beyond supporting distance into a village which they could not hold, by despatching cavalry to cover which had to be hastily withdrawn, and by leaving the British dead some days on the field of fight without any one daring to bring them in for burial. In what, then, did the brilliant success consist? Simply and solely in one thing. The British troops learnt not to be afraid of the Ghazis. From an Afghan point of view it might have been thought that the result of the encounter was to teach the Ghazis not to be afraid of the English. But then this had been already accomplished at Maiwand. It was the courage of those fighting under the British flag that now required a fillip. So low had their spirits sunk, that they could be strengthened and nerved by being sent in and out of a village to be picked off through loopholes, by finding the assistant cavalry suddenly withdrawn, and by looking for some days on the unburied bodies of their fallen comrades. These were things that, under other circumstances, might have been supposed likely to depress rather than elate; but the heads of our soldiers had only room for one proud triumphant thought. They had actually dared to stand up to the terrible Ghazi. It had been positively and definitely ascertained that when the British soldier and the Ghazi met the British soldier need not, and would not, shrink. This was the priceless result of the sortie, and so long as it was gained everything else was immaterial. General PRIMROSE describes himself as having supposed that other ends would be served by the sortie. He wanted to ascertain where the main strength of AYOOB'S artillery was placed. In point of fact, he learnt nothing as to the position of the enemy's artillery. Then, again, the investment of Candahar was almost completed, and General PRIMROSE wished to break the ring. The sortie produced no kind of impression on the investing force, and it was not until eight days afterwards that AYOOB shifted his position, and left the road by which General PHAYRE was to advance comparatively open. It was the approach of General ROBERTS and the oncoming of General PHAYRE that caused AYOOB to move, and the sortie had not affected him in any way. One thing, and one thing only, had

been gained, and that was the restoration of British courage to the fighting point.

It must not be assumed that General PRIMROSE was wrong. It is sometimes necessary to make a fight, otherwise useless, for the mere purpose of giving tone to an army. It is obvious that, after the disaster of Maiwand, the British army at Candahar, beginning with the General himself, was in a state of utter panic. The British troops had unquestionably been beaten by the Ghazis, and driven headlong from a battlefield of their own choosing. General PRIMROSE immediately telegraphed that the army of his colleague had been annihilated, shut himself up in the citadel of Candahar, and patiently waited to see what would come next. He felt and acted like the General of conquered troops which can only be taught by degrees to do something against the conqueror. He felt and behaved, in fact, just as French generals behaved after the crushing victories of the Germans. Even if the general issue of the war could not be altered, the French commanders thought that it was worth while to throw away some lives in order to teach Frenchmen that they could dare to fight their awful conquerors. A panic-stricken general, commanding panic-stricken troops, may be acting according to his best lights if he orders such a sortie as that of the 16th of September, and may be perfectly natural and honest in speaking of it as a success. But it was a kind of success that after it was won must have given and must still give great satisfaction to the Afghans. How they were defeated by General ROBERTS they know perfectly well, and we know in detail, now that the despatches in which General ROBERTS describes the engagement have been published. The Afghans were defeated in a pitched battle by a large body of picked, hardened troops, led by a General of the highest fame and the most brilliant capacity, when every military precaution was taken, and everything that forethought and science could order was carried out to the letter. Against such a leader and such an army Afghans cannot hope to make a stand. But, on the whole, they are, as it is said, satisfied with AYOOB'S campaign. They think more of Maiwand than of the victory of General ROBERTS, and possibly they may think more of the siege of Candahar than even of Maiwand. To have got an English General to describe a sortie as a brilliant success because it taught his soldiers to face Afghan troops is perhaps the greatest triumph Orientals have won over Europeans. It may be technically right that, in furnishing information to his superiors, General PRIMROSE should have given vent to the artless promptings of his modest mind; but the simple story of British panic is not only painful to read, but causes many misgivings as to the effect it may produce when it is read throughout the East, and passed from mouth to mouth by boasting Afghans.

GREECE AND EUROPE.

THE change of Ministry in Greece immediately after the opening of the Assembly has not been fully explained. If the constitutional practice of representative government is strictly followed at Athens, Mr. TRICOUPIS must have been responsible for the warlike language of the KING. If, on the other hand, the Royal Speech was altered from the draft of the Minister, the Cabinet had no choice but to resign. The transaction is the more remarkable because it is believed that there is at present no difference of opinion between Mr. TRICOUPIS and Mr. KOUMOUNDOUROS. Both probably share the national feeling, and all Greek politicians who are candidates for office must at present use the popular language. Those among them who may claim the character of statesmen probably reserve to themselves, when they threaten immediate war, the choice of time and opportunity. It is no imputation on the courage of themselves or their countrymen to assume that there is for the moment no serious purpose of attempting to execute the decrees of the Berlin Conference. But for the anomalous relations of the States of South-Eastern Europe, the KING'S announcement of warlike designs would have been not only impolitic, but dangerous. If Turkey had been really independent, the challenge might have been properly answered by an immediate declaration of war, to be followed by a more effectual naval demonstration than that of the allied squadron in the Adriatic. In the present state of affairs the KING and his advisers knew that the announcement of a warlike policy would be attended with immunity from all troublesome consequences, unless menaces were embodied in acts. The Porte has too many embarrassments on hand to begin unnecessarily a war in which victory would not lead to any valuable acquisition. The Turkish fleet might damage the Greek ports; but the most favourable result of a war would be the retention of Thessaly and Epirus, which need not be defended till they are threatened with immediate attack.

The advocates of the Greek cause, from the KING and his Ministers to the Greek residents who write letters to London newspapers, can scarcely be blamed for the inaccurate version of recent diplomatic proceedings in which they all concur. The European Governments, and especially England, are told that they have promised Greece a certain extension of territory, and that, if they fail to fulfil their undertaking, they will be morally responsible for the risks and losses which their deserted client may incur in executing their decision. The most plausible pretext for the complaint is the Conference of Berlin, which was assembled to discharge the anomalous function of an arbitrator acting on a one-sided submission. The Porte had ratified, by acquiescence, the vague recommendations of the Congress of 1878, having afterwards engaged in desultory and probably insincere negotiations for the settlement of the new frontier. If the litigation were conducted according to the principles of jurisprudence, the Government of the SULTAN would be held to the admission that some territorial readjustment is necessary and just. It was not, indeed, to be expected that Turkish diplomatists should acknowledge the superiority of Greek civilization to their own, or the discontent of the population which was to be relieved from alien rule. It was enough for the purpose to allow that, at the end of a great and disastrous war, it had for sufficient reasons become expedient to make concessions to a State which had taken no part in the contest. The Greek kingdom and its allies or protectors had established an indisputable right to the surrender by Turkey of the whole or part of Thessaly and Epirus. Indeed, within the last month, the Porte has in an elaborate Note offered to concede a part of the territory in dispute, though it still refuses to withdraw from Janina and other important points. The claim of the Greek Government to the larger cession is founded exclusively on the decision of the Congress of Berlin, to which the SULTAN was no party. The unanimous demand of the Great Powers is entitled to political and moral weight; but, if the independence of minor States is to be respected, it has no validity in international law. A war undertaken for the enforcement of the Berlin award would be neither more nor less justifiable than many other contests for objects which seem to the belligerents desirable and expedient. The French war with Austria in 1859 was approved by many English politicians because it promoted the liberation of Italy from foreign rule. Another party censured the disturbance of established order for purposes selected at the discretion of the aggressor. All the world sympathized with CAVOUR and VICTOR EMMANUEL; and Lord PALMERSTON and Lord JOHN RUSSELL, with their followers, extended their approval to NAPOLEON III.; but it would have been almost impossible to find an intelligent Englishman who would have consented to the active participation of his own country in the war. An invasion of Turkey for the purpose of extending the dominions of the Greek kingdom would be in many respects analogous to the supposed policy of an alliance with France in 1859 against Austria. It may be doubted whether the popularity of Mr. GLADSTONE would survive such an enterprise; and it certainly would excite no enthusiasm if it took the form of a sequestration of the Customs revenues of Smyrna.

Mr. THEODORE RALLI and other hasty patriots have imprudently attempted to impose on the English nation and Government a responsibility which rests on a fiction. The KING himself countenances the statement that during the Russian war Greece was induced to abstain from seizure of the coveted territory by assurances on the part of the English Minister at Athens that a pacific policy would be rewarded at the peace by the enforced cession of the districts. Even the most zealous supporters of the Greek cause shrink from the further statement that Janina, Metzovo, and Prevesa were specifically mentioned as part of the territory which was to be acquired. The misstatement, which is perhaps repeated

in good faith, has been long since exposed. It is true that the English Government of the time dissuaded the Greeks from making an attack on Turkey in its extreme need which could have no moral or legal justification. The good counsel which was given may perhaps not have been suggested by exclusive regard to Greek interests; but it was enforced by the conclusive argument that in such a struggle the Greeks would be exposed to imminent danger. The Turks, as against the Russians, were masters of the sea, and their fleet was not at any time during the war fully employed. An invasion of Thessaly would have been immediately followed by the bombardment of the Greek ports without possibility of retaliation. It is also doubtful whether an invasion of Turkish territory by Greek [illegible]ies would have been successful. In Epirus, if not in Thessaly, indigenous resistance might probably have proved too much for the invaders. Much excuse is to be made for zeal in a national cause, especially when, as in the present instance, the instinct of patriotism coincides with a just estimate of the general welfare; but Greek advocates will not be well advised in claiming as a right the aid which they may probably not solicit in vain as a favour.

It is not necessary to accept literally the statement of the new PRIME MINISTER to the Chamber, that the Greek Government intends to rely on itself, and not to depend exclusively on the policy of the Great Powers. It would be impossible to obtain either the support of the country or the necessary Parliamentary sanction for the maintenance and increase of the army, except by professed readiness for war. The reasons against a hasty rupture with Turkey seem at a distance to be conclusive; but in political calculations it is never safe to rely on apparent expediency or even on probability. It is, after all, possible that the Greek army may, without ostensible allies, be ordered to cross the frontier. There would perhaps be no serious difficulty in occupying the districts which the Turks have from the first professed their readiness to cede. It is not likely that great military preparations have been made in Thessaly or in the southern part of Epirus; and the Greek commander might perhaps be directed not to attack immediately the strong positions in which he might encounter both the Albanians and the Turkish regular troops. If war is declared, the decisive measure will probably indicate an understanding which is not otherwise known to exist between the Greeks and the other enemies of Turkey; yet the policy of an alliance with Bulgaria, or with Sclavonic insurgents in East Roumelia and Macedonia, would be highly questionable. There is some force in the suggestion that, to a great extent, the interests of the Greek nation, if not of the existing kingdom, may be reconciled with those of Turkey. There is no room for Greek influence or intellectual predominance in the wholly or partially emancipated provinces.

ITALY.

THE POPE'S speech removes any doubt as to what may be termed the permanent official view of the holders of the See of St. Peter as to the relations of the Papacy to the Kingdom of Italy. They are the views which not only LEO XIII., but every possible Pope, must necessarily hold. In real life everything depends on the mode in which the official holder of these views thinks right, or is guided by his own character or the circumstances of the time, to apply them. They may be equally held by a Pope who is an open adversary of Italy, or by one who asks the world to look on the agonies he is passively enduring, or by one who makes the best of bad things and acts in a spirit of conciliation and compromise. But if a Pope speaks of his position at all, he must at least speak of it in language as decisive as that used by LEO XIII. He has lost the temporal power enjoyed for centuries by his predecessors. He cannot affect not to deplore the loss, he cannot speak as if a wrong had not been done him, he cannot abandon his claim to have his own again. The special point, however, to which LEO XIII. now draws attention is the insufficiency of the substitute for the Temporal Power which has now been given him. He is asked by his adversaries to own that he has got all that he can reasonably want, and he entirely declines to admit that he has got anything of the kind. He is told that he is treated with every honour befitting his dignity. He replies that priests are insulted in Rome, and that a day of rejoicing has just been held to commemorate the awful hour when the sacrilegious troops of VICTOR EMMANUEL broke by force into his city and made themselves masters of Rome. He is told that his spiritual authority is unquestioned; and he replies that congregations formed to support him are broken up, that his bulls need an *exequatur* before they can run in Italy, and that the State claims to control his nominations to bishoprics. He is told that if he looks on Italian Rome he can see nothing to offend him openly; and he replies that Rome has under his very eyes been desecrated by such foul dens of heresy as Protestant churches being allowed to rise in its streets. A Pope would not be a Pope who did not mourn when rude men show their dislike of priests, who did not regard the forcible occupation of Rome as a wicked act, who did not take the side of the Church in the old quarrel about bulls and bishoprics, and who did not regard the erection of an heretical temple as an eyesore and an offence. But, although the present POPE is as decisive in speaking of these things as every Pope must be, the tone he adopts differs greatly from that habitually employed by his predecessor. There is nothing like spiritual thundering in his speech. There are no denunciations of the KING and people of Italy. He utters a quiet gentlemanly protest against the supposition that he has nothing to pardon and nothing to regret, and leaves the world outside the Vatican to go on much in its own way.

That portion of the world which comes nearest to him in his retreat will in a few days have such excitement and interest offered to it as is provided by the assembling of the Italian Parliament. It is not probable that when the Parliament meets it will have much time or thought to give to the POPE or his troubles. It will be occupied with asking the Government to explain and defend its policy at home and abroad. Nothing has happened in the recess which in any country but Italy would be thought likely to shake such confidence as is felt in the Ministry. Not even the best-informed Italians pretend to have any means of foretelling when a Ministry is going to fall, and the present Ministry may come any day to an end. But there seems to be nothing that has been done by it, or that has happened to it lately, to cause it immediate uneasiness. GARIBALDI has been at Genoa, but then he has gone away again. He has tendered the resignation of his seat as a deputy, but then he has withdrawn his resignation. The Government had the good sense to take his visit with extreme quietness. It paid him every respect, and allowed admiring crowds to cheer him, to follow him, and to sit all night outside an hotel where not a glimpse of him was to be seen. Not hurriedly, but in due course of time, the KING pardoned GARIBALDI'S son-in-law, whose short, but not uncomfortable, stay in prison would have been still shorter had not the eccentric idol of Italy thought proper to land at Genoa in the character of an avenging angel. The Government so managed matters that exactly the right amount of respect was paid at once to GARIBALDI and to the law. The breeze, if a faint flutter of hot wind deserves to be called a breeze, that sprang up between France and Italy about the acquisition of a railway in Tunis by an Italian Company, seems to have died away; and in the famous naval demonstration Italy took the part that became her. She did exactly as much and exactly as little as her neighbours, letting it be guessed, however, that, if she had to be guided by any Power, she would turn in preference to England. The troubles that await the Italian Ministry are domestic rather than foreign. It, like the English Liberal Ministries of old days, is haunted by the promise of a Reform Bill which it is equally unable to neglect and to frame. But, as usual, it is finance that again promises to be the crucial question of Italian politics; and this time, it is supposed, the question will assume a very large and important form. Italy is bound to the other members of the Latin Union to redeem, within a time which is fast running away, the small silver coins which have been driven out of the country by the forced paper currency. It is indispensable to the restoration of a sound state of Italian finance that the volume of this most objectionable currency should be diminished. But it can only be seriously diminished by a large outlay of money, which with Italy means a large loan. The credit of Italy is now good, and there has recently been a considerable rise in the price of the Italian funds. But in order to borrow largely, without affecting unfavourably the

national credit, it will be necessary to offer such a reasonable scheme of general finance that the Parliament and the nation will be satisfied that the proposed operation will be not only beneficial to the country, but well within its means. To draft such a scheme, to complete its details, and above all to get the Parliament to accept it, is a task so difficult that the MINISTER of FINANCE will cover himself and his colleagues with glory if he accomplishes it.

The death of Baron RICASOLI has swept another name off the roll of veteran Italian statesmen. In his later years Baron RICASOLI lived in retirement, but few men did more for Italy in his day. As dictator of Tuscany after the settlement of Villafranca, he carried, by the ascendency due to his high character and his unwavering firmness, the annexation of the Grand Duchy to Piedmont. When CAVOUR died, it was RICASOLI who was thought most fit to succeed him. When LA MARMORA went to take the command of the Italian army in the war of 1866, it was RICASOLI who was charged with the difficult duty of presiding over the Ministry which remained to watch how Venetia by arts or arms was to be won for Italy. It was by the zealous concert of the best men of all classes that the independence of Italy was won, and RICASOLI was one of the best specimens of Italian patriots who belonged to the ancient territorial aristocracy. Honourable to a scruple, calm, reserved, and almost stern, he won the lasting respect of his countrymen, of whose character he represented a side familiar of course to Italians, but unsuspected by those foreign critics who appear to evolve their conception of Italians out of the study of organ-grinders. The memory of another Italian statesman, who belonged in many respects to the same school as RICASOLI, has lately been revived by the unveiling of a monument erected at Barletta in honour of MASSIMO D'AZEGLIO. The best days of MASSIMO D'AZEGLIO were over before those of RICASOLI began. He had fought with CHARLES ALBERT in the war of 1848, and was the first Prime Minister of VICTOR EMMANUEL. It was he who first invited CAVOUR to a seat in the Cabinet, and he had the sense to see and the modesty to own that, with the little man at his side, he was one of those who reign but do not govern. When, years afterwards, CAVOUR sent the Piedmontese troops to the Crimea, MASSIMO D'AZEGLIO gave a hearty support to what seemed a very hazardous undertaking. If he did not contribute greatly to the establishment of Italian unity, he contributed very largely to make the kingdom of Piedmont fit to become the corner-stone of Italian unity; and Italian unity could never have been established had not Italy had, besides CAVOUR and patriotism, a King who deserved to reign over a great nation, and a band of statesmen round the King who had learnt experience, faced difficulties, and maintained sound and just principles in a small but free State. Other men like-minded, but necessarily with a different past, were found ready to work with the statesmen of Piedmont as one portion of Italy after another came into the fold; and Italy in a large measure became the Italy of VICTOR EMMANUEL because such men as RICASOLI were ready to take up the work of such men as MASSIMO D'AZEGLIO.

SPEECHES OF THE WEEK.

WITH the first snows have come the first political speeches of the winter. It is unusual, especially at a time which cannot be said to have been a quiet or uneventful time, for so little talking to be done as has been done as yet in this autumn. But the lateness of the Session; the absolute need of some rest which must have been felt by the most resolutely talkative of legislators; and a not unnatural feeling on the part of the Opposition that a superfluity of comment would weaken their case against the Government may probably account for the lull. It has, as we have said, been broken this week in good earnest. Sir STAFFORD NORTHCOTE has indeed spoken only on non-political topics. But, independently of the smaller fry, Lord SALISBURY for the Opposition, Mr. CHAMBERLAIN for the Government, and Mr. COWEN for the independent Liberals, have delivered themselves, the first two on both of the pressing questions of the hour, the third on Ireland only. Mr. COWEN's speech contained the mixture of shrewdness and "viewiness," of practical good sense and vague theoretical Radicalism, which is usual in his speeches. No one perhaps has gone more to the root of the matter than Mr. COWEN in his remark that it would strike most Englishmen as unfair that a tenant should be at liberty to get the highest price he could for his goodwill if a landlord was to be restricted in the rent he might ask. This is the sort of thing that everybody can understand, and that it would puzzle the adroitest Land Leaguer to answer in any manner likely to satisfy an impartial person. Yet at the same time Mr. COWEN is reported (though it must be confessed that the reports of his speech differ strangely) to have lauded the hopeless Land League plan of State purchase and gradual redemption by the tenants—a plan the absurdity of which Mr. P. J. SMYTH made manifest, though indeed the demonstration was not needed by any one who had the slightest knowledge of Irish history or of Irish character.

The speeches of the late Foreign Secretary and of the PRESIDENT of the BOARD of TRADE were naturally of more practical interest. In particular Mr. CHAMBERLAIN may be said to have slipped, purposely or unawares, into a declaration of some importance when he said that "the "Government were bound to find some means of giving "to the Irish tenants some right or interest in the soil "which they tilled, which should not be in the power of "absentee landlords." We do not know that anything quite so explicit has yet been said by any member of the Government, and Mr. CHAMBERLAIN may be congratulated on the happy manner in which he has emulated his chief's peculiar knack of saying the unwisest things. For, if the tenants of absentee landlords are to have preferential advantages over the tenants of resident landlords, there is a clear inducement to drive the resident landlord out of the country. There are plenty of ears in Ireland quite open to hear and digest this teaching. Beyond a glowing description of the extraordinarily good time coming in regard to commercial matters, and an oratorical insinuation that Lord SANDON was a thief, Mr. CHAMBERLAIN's other utterances were chiefly personal. It is interesting, no doubt, to know that the magic wand of the present Government, besides pacifying Ireland and finally settling the map of Eastern Europe, is going to quiet once for all the demands of Mr. PLIMSOLL, to set the relations of the Railway Companies and the public on an ideal basis, to perfect the Patent Laws, the Bankruptcy Laws, and a few other trifling "arrears of the late "Government," as Mr. CHAMBERLAIN put it, in a phrase which is a triumph of probably unintentional humour. But his hearers, no doubt, took still greater interest in the personal explanations of their member. Mr. CHAMBERLAIN gave Birmingham a lively history of his *nolo episcopari*, and of the considerations of public duty which made him submit to the painful process of being put above his dear friend Sir CHARLES DILKE. "It was a painful thing, a very "painful thing," as another person of eminence once remarked. But Mr. CHAMBERLAIN's sense of duty steeled him to bear it; and it is a singular instance of the goodness of the upper powers that men almost always have a sense of duty vouchsafed to them which steels them to bear similar inflictions. These revelations were no doubt intensely interesting to Birmingham, just as, had the matter been the other way, parallel revelations would no doubt have been intensely interesting to Chelsea. But the world at large may possibly, such is the irreverence of that world, contemplate them with less respect than amusement, mingled perhaps with a little surprise that Mr. CHAMBERLAIN should so openly show his opinion of the mental calibre of his constituents.

It has often been suggested that the recent inventions of Professor BELL and his rivals, if they could be thoroughly perfected, would enable cynical persons to enjoy a singularly delightful pastime. A telephonic arrangement by which Mr. CHAMBERLAIN's words from Birmingham and Lord SALISBURY's from Taunton could have entered the right and left ears of a person able to employ both organs simultaneously, would certainly have provided this rarity. The PRESIDENT of the BOARD of TRADE, to do him justice, did not attempt to discuss either Albanian or Irish questions at any length. As to the former he said that he had nothing to say, because the transparent openness of his Government rendered it perfectly unnecessary to say anything. Anybody who had heard or read their speeches last spring was, according to Mr. CHAMBERLAIN, in just as good a position to know all about what they had been doing or were going to do as Mr. GLADSTONE's most trusted confidants. It is odd that Lord SALISBURY, who generally passes, even with his enemies, for a

man of some penetration, seems to be entirely unable to read these delightfully open riddles. Lord SALISBURY, it is to be observed, did not fall into the error into which it is in some quarters assumed that every hostile critic of the policy of the present Government must fall—the error of arguing against the Treaty of Berlin. He admits the strict legal obligation under which the SULTAN lies to cede Dulcigno, and only questions the wisdom of the violent, or apparently violent, enforcement of the cession, now that it is obvious that the persons aggrieved by it are not so much the SULTAN and his Ministers as the Albanians whose allegiance is transferred. But, if Lord SALISBURY had to tread with some wariness the labyrinth of the Berlin Treaty, the same cannot be said of his comments on the actual methods of persuasion resorted to by the Government, and on the still graver question of the probable extension of those methods to objects of much more importance than the transference of a hamlet on the sea-coast from very valiant and uncivilized persons who do not cut off the lips and noses of their prisoners to very valiant and uncivilized persons who do. In the absolute secresy in which the Government have wrapped up their intentions—perhaps, after all, Mr. CHAMBERLAIN is not far wrong, for the speeches of last winter and spring are nearly as effective hiding-places as the proverbial bottle of hay for the proverbial needle—no one knows what is to be done in Thessaly any more than what is being done in Albania. No one can pretend—or rather, as that is in these days a rash assertion, let us say that no one can succeed in showing—that the Berlin Treaty binds the SULTAN to give one foot of land to Greece, or that the Powers are entitled by that treaty to enforce the giving, even with guns half of which at least are warranted not to go off. Yet the interest and importance which Lord SALISBURY attaches to the knowledge of what is to be done in this thorny matter can hardly be thought exaggerated, now that the sons of the Greeks are writing brave words about Christian armies and such like things. It is true that it is rather a habit of the sons of the Greeks to write and speak brave words; perhaps they hope to establish their parentage by the trait.

As the winter advances we must look forward, no doubt, to a great increase of such eloquence. We wish we could look forward to a diminution in the gravity of the events which are likely to call it forth. It is unfortunate, but unavoidable, that the discussion must more than ever take the form of recrimination. "You are "carrying on secret transactions," says the one party. "So did you when you were in office," says the other. Of course the retort is hopelessly weak in the circumstances; but this is of less importance than the unprofitable nature of such a discussion at any time. There are as yet no signs that the singular *carte blanche* which a majority of the constituencies gave to Mr. GLADSTONE to manage the Eastern question at his will has been seriously retracted, and until there are such signs a certain unreality must unnecessarily attach to hostile criticism of the way in which he chooses to fill up the blank. Logically, every word that Lord SALISBURY said the other night is irresistible. But Mr. GLADSTONE and logic are two things which never, except perhaps for a brief period at Oxford under the auspices of Dean ALDRICH, have had much to say to one another. The Irish matter is more likely to give scope to the critics. There are not wanting signs that some of the stanchest supporters of the Government are shocked at the prevailing anarchy, and at the apparent resolve of the Government to deal with it, not by the only means which have hitherto proved effectual, but the slow and generally futile method of prosecuting individual agitators. Mr. WATKIN WILLIAMS is not a person of much importance, but his remarks on the subject at Liverpool the other night may have something more than a personal significance.

BRIBERY.

ONE characteristic of the disclosures elicited by the Election Commissioners is the monotony of the processes of corruption. The same causes in similar circumstances produce the same results; and there can be no doubt that they operate in boroughs which have avoided exposure. Some of the worst constituencies have been saved from inquiry by the knowledge of both parties that gross corruption was practised by themselves as well as by their adversaries. There are probably not many candidates who, like the petitioner against the return for Sandwich, engage in a contest in the character of private detectives; nor, perhaps, are there many who have so pleasing a faith in the incorruptibility of electors as Mr. CROMPTON-ROBERTS. Another local peculiarity of Sandwich and Deal is that the candid and unprejudiced electors took bribes on both sides, giving nevertheless due weight to the more liberal offer. In other boroughs, as in Gloucester and Chester, the managers professed to have been tempted into dishonest practices by their knowledge or assumption that the other party was bribing and treating, and that it was hopeless to persevere in the contest except by adopting the same methods. At Macclesfield, a principal agent expressed to the simple-minded candidate a natural regret that he was not allowed to go in and win. The market was open, the competitor was buying freely, and there was still no doubt that the highest bidder would be preferred. There is reason to doubt whether, in any of the cases which have been investigated, the offenders have been tempted into wrong by the practices of their opponents. Bribery has in those places long been an established institution, and the managers have not had occasion to wait for novel precedents. Nothing is more remarkable than the modest price of votes in some of the boroughs. Intelligent electors have been contented for ten, fifteen, or twenty shillings to support, as the case may have been, the virtuous Mr. GLADSTONE or the daring Lord BEACONSFIELD.

The late increase or recrudescence of bribery may be largely attributed to the Reform Bill of 1867. It was perhaps not the worst quality of the voters who were then added to the constituent body that many of them had no political opinions. They found themselves in possession of a saleable commodity of no value to themselves except for the purpose of a bargain. At the election of 1868 defeated candidates in many places asserted that they could, if they had thought it right and safe, have bought a majority at the rate of half-a-crown a head. Others, who may have been less scrupulous or less timid, probably took advantage of the opportunity. The prevalence of direct corruption was regarded with comparatively little anxiety, when the new Parliament, after a year's hesitation on the part of the House of Lords, passed the Ballot Act, which was to make bribery impossible. The advocates of secret voting argued, with much plausibility, that no prudent man would pay large sums for an article of which he could not secure delivery. They also contended that bribed voters, not being persons of honour and delicacy, would probably spoil the market by habitually cheating their customers. It was impossible to test plausible and probable anticipations except by experience. All parties, with the exception of practical professors of the electioneering art, have been surprised to find that there is honour among corrupt voters, and that candidates or their agents rely with reason on the good faith of a crowd of cynical rascals. The same astonishment was expressed by BURKE, in a speech quoted by Mr. TREVELYAN on the New Shoreham election of 1770. "I am shocked," he said, "at the wisdom to be found in "those transactions. I am shocked at the virtue, at "the principles of honour and trust, on which these "men acted, principles deserving a better cause." The Ballot has done good in diminishing disorder and intimidation, though it has weakened or destroyed much wholesome influence. But the practice of bribery appears to have been wholly unaffected by the change. If a scandal which ought not to be tolerated is to be removed, some new device must be invented to counteract it. Mr. FORSTER was hasty in justifying his late attack on the House of Lords by the incredulity with which ten or eleven years ago it received his assurances of the beneficent efficacy of the Ballot. An alternative remedy may perhaps in the first instance provoke equal scepticism amongst legislators selected, as Mr. FORSTER says, by the accident of birth.

A writer in the *Times*, with the statesmanlike foresight by which that journal is distinguished, proposes the disfranchisement of all boroughs of the size of Gloucester and Chester by swamping them in electoral districts. A town of thirty or forty thousand inhabitants would, it seems, be entitled, in an equal division, only to two-thirds or three-fourths of a single member, and the magnitude of the new constituencies would reduce

or destroy the pecuniary value of a vote. The suggestion would not be frivolous on the part of a thoughtful democrat who deliberately desired to concentrate all power in the hands of popular agitators and orators. Enormous constituencies, though they are exposed to every other bad influence, are comparatively exempt from direct bribery. The corrupt class in the United States is not the mass of voters, but the professional managers who manipulate elections. The populace is paid by deference to its passions and its prejudices, while its confidential advisers secure to themselves more substantial rewards. It is possible that future extensions of the suffrage in the United Kingdom may, on the whole, tend to diminish bribery; but the first instalment of further Parliamentary reform will almost certainly aggravate the mischief. The recipients of bribes belong, with few exceptions, to the poorest class of voters, being either small householders enfranchised in 1867, or the residue of the ancient freemen. The present Government is pledged to confer the suffrage on the agricultural labourers, who are for the most part poorer and less instructed than the working class in boroughs. Unless they are stimulated and controlled by demagogues, the future rural constituencies will, as a rule, have no political opinions, and labourers will see no reason for refusing to sell their votes to the willing purchaser. The counties, which are believed to have been hitherto exempt from direct bribery, will, after the next election, probably furnish an ample field for the detective sagacity of a new batch of Commissioners. It is true that revolutionary passion or cupidity may at any time supersede the influence of money; but the purifying tendency of political tempests is no compensation for the ruin which they inflict. Some political critics have expressed the paradoxical opinion that corruption is not the worst peculiarity of American institutions.

It is not satisfactory that legislation and government should be in any degree controlled by the nominees of electors who have sold their votes. The venal constituents whose misdeeds have lately been exposed have no moral right to political power; but it is a strange conclusion that they would be entitled to greater respect and deference if they could be compelled to give gratuitous votes. Their acceptance of bribes is only an illustration, and not a cause, of their unfitness to choose fit representatives. The best service which they could render to their country would be to defeat the purpose of democratic Reform Bills by declining to vote. This is, in fact, the course which has in some cases been followed where bribes were not forthcoming. In the absence of pecuniary motives, the votes of corruptible electors are most likely to be given on the wrong side. The Birmingham organization, as compared with the Gloucester and Macclesfield system, recalls the memory of THURLOW's hesitation between two candidates for a high judicial post:—"I don't know which is worse, the in-"temperance of A. or the corruption of B.," but the CHANCELLOR further remarked, "Not but what there "is a—great—deal of corruption in A.'s intemperance, and "a—great—deal of intemperance in B.'s corruption." There is apparently a good deal of corruption in the party zeal of the Three Hundreds and Four Hundreds; and even deputations from Birmingham itself have not escaped suspicion. The secretaries or officers of the new fangled Clubs have already begun to take part in the business of bribery. At Chester the Liberal candidates thought it prudent to separate themselves from the local Liberal Association, that they might not be responsible for its probably questionable proceedings. They afterwards found to their cost that they had only eliminated one among many elements of corruption; but they had no reason to regret that preliminary precaution. It is but too probable that the late revelations will serve as a pretext for further extension and equalization of the suffrage. The Ballot Act is not likely to be repealed; nor indeed can it be justly denounced as the cause of abuses which it has merely failed to correct. The unfitness of a part of the present constituency to discharge its duties will not be removed by the admission of a still more incompetent class, or by the total destruction of the greatly diminished influence of property and education.

SPAIN BY A SPANIARD.

A WORK appeared some months ago which had the rare merit of being written by a Spaniard about Spain and at the same time of telling the truth about the country of the writer without reserve and without bitterness. The author was the Marquis of RISCAL, and a summary of his work was composed with much care and clearness by M. LOUIS LANDE, whose untimely death gives a value to all he left behind him. Señor DE RISCAL draws a picture of Spain which is evidently taken from the life, and he has pondered over the facts he has accumulated long enough to trace evils to their sources, and to see what remedies would be effectual if they could only be applied. To Spaniards such a work would be invaluable if they would study it until the lessons it teaches sank into their minds. But, if Spaniards would read and could profit by it, Spain would not be the country it is now; and the author has the good sense to let it be understood that he is aware that his appeal is made to ears that will not hear and to eyes that will not see. To foreigners it is a matter of some interest to know what Spain is really like; but for them a mere knowledge of Spain is not the chief gain they can derive from this work. Spain is only one of numerous countries which are at a particular point and a low point in the scale of modern civilization. When we have once clearly ascertained the precise standard reached by such a country, we can not only place others on a par with it or above it, but can apply a series of tests by which we can ascertain the real meaning of the superiority in civilization which we attribute to one nation over another. Englishmen may be permitted to say that, if these tests are applied, England, in spite of some shortcomings, seems to have been more successful than any other European country; yet Englishmen cannot but remind themselves how comparatively recent is the time in their history when things were very different, and when many of the evils depicted by Señor DE RISCAL had their counterpart here.

The first thing which any one living in any State needs is personal security. In Spain there is not much actual murder, but there is a rampant brigandage which only stops short of murder provided it can rob without it. Even in Madrid itself, in one of the finest and most frequented streets, a member of the Senate was, only two years ago, kept prisoner in his own bedroom and threatened with death until he paid the ransom demanded of him. Bands of robbers, as is only too well known, haunt the mountain districts even in the neighbourhood of the capital. The brigands are said to have friends in very high places; they exercise a terror which prevents quiet people from daring to give evidence against them; they walk out of prison if they are put into it; and when they hold land they pay to the Government just the amount of taxes that they think convenient. Justice again is slow in most countries, but in Spain it scarcely moves at all. Every process is secret, and everything is carried on in writing. The pile of papers heaped up in reference to the murder of General PRIM ten years ago mounts up and up; but it is not even yet thought high enough, and a trial seems as far off as ever. The Government is as unable as any one else to ensure a speedy conviction, and if it really wants to get rid of notorious criminals, it shoots them on the pretext that they are trying to escape. In minor matters there is the same inevitable delay; and in 1879 the official Gazette announced that a witness was wanted in reference to a railway accident that occurred in 1864. Every Administration, too, invents new rules and wants things to be done in its own style; and, whenever proceedings have been pushed forwards a stage, compliance with some new regulation is exacted, and the matter is, and always remains, just where it was. As a last resource, forgery is called in, on the chance that it may expedite the course of business when nothing else will. Next to robbery with violence, forgery appears to be the favourite failing of the nation. Even brigands forge, so that they may show themselves as good and as civilized as their neighbours. Not long ago in one of the principal ports of the Mediterranean a cargo of goods was got through the Custom-house duty-free by means of a whole set of documents forged in the Custom-house itself. And so notorious and so general is the practice, that when it appeared that forgeries of coupons of the State debt had been made actually in the office where the debt is supposed to be

controlled, the MINISTER of FINANCE mildly replied to questioners in the Chamber, that in a country where coin, banknotes, and every kind of private document were habitually imitated, no one could wonder that the same ingenuity should be employed in forging State coupons.

On some of the better-known failings of the country it is not necessary to dwell. Spanish finance is always in a mess. Accounts are never finally made up—that, for example, of the African war being still open. No Budget is ever meant to tell a story that will bear examination, and the increase of the floating debt and the partial spoliation of the creditor are sources from which relief is boldly and habitually drawn. The Minister of Finance knows that he is not responsible to any one. He belongs to the Ministry, and the Ministry which has determined how every election shall go, and has given seats to the Opposition as well as to its supporters, does not consider itself accountable to the Chamber of its own creation. It is indeed the key to everything else in Spain that a Ministry makes itself, and when it is made, it makes everything else. It makes the Chamber; it replaces every official from the top to the bottom. But in a remote way the public affects a Ministry, for it terminates its existence. The Ministry of the day is fiercely attacked by every one who has lost, or who hopes for, employment. At length there is a rumble of indignation before which the Ministry bows, to be replaced by another which does exactly the same thing. As a rule, the country is profoundly indifferent, for it has the indifference of habitual stagnation. There is scarcely any commerce in Spain except what is in the hands of foreigners. Bills of exchange are almost unknown. There are railways, but no roads to them; adjoining districts are so entirely cut off from each other that the population of one may be starving while that of the other is obliged to sell its wheat for a song; and while a large part of the good soil of the country is untilled, any one who is ambitious enough to improve his property finds his gain gone by the Government pouncing on him for new taxes. What little the people can save they put into lotteries, and although there are Spanish enterprises which are quoted on the Bourse, no prices are given, as no one thinks it worth while to deal in them. Fortunes are, indeed, occasionally made in Spain, when, as has happened at a great pinch, the Government borrows at the rate of a hundred per cent.

This is a dark picture, and, if it is accepted as true, it must strike every reader at once that Spain as thus described is exactly like the Spanish colonies of America, is very like Turkey, but a little above it, and very like Greece and Roumania, but a little below them. It is perhaps true that the picture is somewhat too dark. Every detail may be accurate, but the general air given may be too sombre. Bad as Spanish finance may be, and poor as the country may be, Spain pays something to her creditors, and is said to be on the eve of proposing an arrangement which will benefit them while it reduces the yearly charge she has to meet, and which it is asserted can be carried out by the Government tapping the money that is hoarded by very humble people. Nothing, however, can shake the main positions of Señor DE RISCAL. He wants, as all serious thinkers want, to go to the root of the evils he describes. If it is asked what is to be done, he replies that some things are so obvious that to state them is to show that they must be done unless the country is content to stay for ever where it is. The administration of the law must be recast. There must be a decently paid irremovable magistracy. There must be a gendarmerie the members of which are not changed with every new Administration. Proceedings must be open, not secret, and oral, not in writing. The Civil Code must be completed, and there must be enough judges, properly trained and properly paid, to dispense civil business. Secondly, the army of officials, living and plundering on a precarious tenure of their posts, must be cut down, and the remnant, with the exception of a few of the very highest rank, must be secured permanently in their offices. Lastly, all ordinary placemen and Government contractors should be excluded from the Chamber; the electors should return their own members, and should return none but honourable and well-known men; while the Chamber should make the Ministry, and not the Ministry the Chamber. No doubt all these things are good, and much to be desired for Spain; but in England we know with what efforts, after how long a time, and in some respects how imperfectly, we have obtained them. How are Spaniards to begin not to be Spaniards? Señor DE RISCAL suggests that it would be an admirable stimulant of healthy opinion if a paper of a high class, rigidly impartial, full of information, and enforcing the highest principles, could be started, made to pay, and circulated through the country. He is, however, alive to the initial difficulty that, as things are now, such a paper, if started, would be at once suppressed. But he also suggests, and it is the only suggestion that is practicable, that those who wish to do great things for Spain should begin by doing little things. An honest Spaniard need not sit with his hands folded, or only raised to lift his cigarette, because he cannot remodel the law, the electorate, and the bureaucracy of his country. He must begin with something, and if he wishes to begin, all experience shows that the very best thing he can do is to bestir himself in the region of finance. Financial reform has two great attractions. It almost alone of reforms awakens no religious bitterness, and it finds well-wishers in every taxpayer who does not live on the taxes. An Opposition leader who could forego the pleasure of thundering against the general iniquity of his opponents might do his adversaries more harm and himself and his country much more good by making himself master not only of the details, but of the general scheme, of the Budget. And those who keep out of the arena of active politics, and yet wish to enlighten and stimulate their countrymen, cannot do anything more profitable than to examine and explain the incidence of taxation, and the general pecuniary needs and resources of the nation.

BRITISH FARMING.

THE publication of the Agricultural Returns throws light upon the condition and prospects of British agriculture at the close, as we may hope, of one of the most trying crises through which it has ever passed. A long succession of bad wheat harvests, culminating in 1879 in the worst of the century, and aggravated in that year by unsatisfactory crops of all kinds and by destructive sheep disease, would, under any conditions, have told severely upon our farmers. But at former periods they would have been able in a large measure to throw their losses upon the community at large by raising the prices of their corn and cattle. Now they have been unable to do this, because at the moment when European seasons were at their worst those of America were excellent; and as it also happened that at that time an exceptionally large proportion of the American population was engaged in agriculture, American competition forced down prices, even in departments which had previously been believed secure against competition.

Every one has heard of the consequent agricultural distress, resulting in England in a general reduction of rents, in the throwing-up of farms, and a difficulty of finding new tenants; and, in some districts of Ireland, in actual famine. What has been the effect upon cultivation of this unprecedented combination of disasters? Bad seasons, however prolonged and however severe, must, in the natural course of things, come to an end some time. Were it, therefore, only bad seasons that the farmers had to contend against, we should expect them to struggle on doggedly, and to be supported in doing so by the landlords and their other creditors. But American competition may be expected to continue, not perhaps in all its recent severity, but still keenly enough to have a depressing effect on those who are exposed to it. On the whole, however, the disheartening effects of these accumulated and prolonged difficulties have not been as great as might have been anticipated. At first sight, indeed, it seems as if there had been actual progress, in spite of all the adverse circumstances we have mentioned. And so, no doubt, there has been in certain respects, and in certain portions of the country. In Great Britain, for example, the cultivated area has increased to the extent of 1,694,000 acres as compared with 1870; or, as Mr. GIFFEN puts it in his Introduction to the Returns, an acreage larger than the whole surface of Devonshire has been added to the area under cultivation in the last ten years. Even compared with 1879, there is an increase this year of 126,000 acres. This last fact is very striking at a first view. It is a recognized principle of political economy, or rather of common sense, that new capital does not continue to be invested year after year in a trade unless that trade is profitable; and here we have

the fact that during the past ten years, in spite of exceptionally bad seasons and foreign competition, reclaiming, draining, fencing, clearing, and tilling have rescued, as it were, a great county from barrenness and made it useful to man. It would seem to follow that the talk about distress, if not without foundation, is grossly exaggerated. But it must be borne in mind that these Agricultural Returns are of very recent date in Great Britain; that at first they were extremely defective; and that they have gradually been made more correct, though they are still far from being what they might be if the Statistical Department of the Board of Trade possessed fuller legal powers. In other words, much of the increase we have noted is merely nominal, being due to improved returns alone. Further, nobody pretends that farming has everywhere and in all cases been unprofitable. And it is also to be borne in mind that bare fallow—that is, land ploughed up, but not under crop—is included in the area officially described as cultivated, and therefore fields thrown upon the hands of landlords and left untilled go to swell the acreage under cultivation. It is enough to state this fact to show how fallacious is the mere increase of what is called the cultivated area. Practically, holdings which are untenanted, and are neither stocked nor tilled by the landlord, constitute land gone out of cultivation. Now the returns show a large increase of bare fallow, or uncropped arable land, and the increase is largest in Essex, Hampshire, Wiltshire, Lincolnshire, Berkshire, Oxfordshire, Gloucestershire, and Devonshire—that is, in the most fertile counties of England.

Coming now to somewhat more minute detail, we are surprised to find an increase this year, as compared with last, in the acreage under wheat. It will be recollected, however, that from first to last the harvest year 1879 was exceptionally bad. This year, on the contrary, the seedtime was very favourable. While London was afflicted by months of almost constant fog, the country was rejoicing in bright, dry weather, most favourable to the preparation of the ground for the seed. Accordingly, several of the returning officers state that an additional acreage was sown. But from other parts of the country the officers report a decrease, because of the number of vacant farms. On the balance, however, there is an increase of 19,000 acres. Looking back to the earliest of the returns, we observe fluctuations from year to year, due to special and temporary causes; but the general tendency is decidedly towards decrease. Thus, for the ten years to which we have extended our review, the area under wheat has fallen from 3,500,543 to 2,909,000 acres, a decrease of more than 591,000 acres, or almost 24 per cent. It is, however, to be observed that in 1874 the wheat acreage was actually greater than in 1870, and that it was not till 1876 that the decline became serious; and even then there was recovery in the two following years. In short, previously to 1879, the wheat acreage only once fell below three million acres. It remains to be seen, therefore, whether better times will not witness a resumption of wheat-growing on a considerable scale. Meanwhile, the past two years have brought about a great falling-off. In Scotland, in particular, the decrease has been steady and marked. While, as we have seen, there has been a small increase this year in the wheat acreage, there is a very large falling-off in the breadth of land under barley as compared with last year, amounting to 200,000 acres. The extremely inferior quality of the barley crop of 1879, and the difficulty of securing it amidst continuous rains, sufficiently account for the decrease. But it is to be added that only three times in the last ten years has the present barley area been exceeded, and therefore the decrease, after all, stands in little need of explanation. In oats there was this year an increase of 5 per cent. in the breadth of land sown, which, in fact, has been equalled only once before since 1867. The oat crop, it may be recollected, was the best of all the corn crops last year, and this circumstance probably had considerable influence in deciding farmers to increase their sowing. On the other hand, peas and beans have considerably fallen off. The reason assigned is that maize is now used very largely for the purposes for which peas and beans were formerly grown, that the imports of maize have doubled during the past ten years, and that consequently the area devoted to these crops has gradually declined.

To sum up, then, what we have been saying in respect to the corn crops. There has been a slight increase in the area under wheat as compared with 1879, and a considerable increase under oats, while under barley there has been a large decrease, and under peas and beans a considerable decrease. The area under all of these crops, taken together, amounts this year to 8,876,000 acres, which is a decrease upon 1879 of rather more than 1 per cent. But if we extend our review back to 1870, as we have been doing, we find the decrease to be 7 per cent. When it is borne in mind that in those ten years the area newly brought under cultivation exceeds in size the county of Devon, it will be seen how great a revolution in the agricultural economy of the kingdom is implied in this decrease of 7 per cent. in the acreage under corn crops. The comparative cheapness with which America and other foreign countries can grow corn has not only counteracted the influence of the increase of population at home—which would, under other circumstances, cause more and more of the soil of the country to be devoted to the growth of corn—but has actually caused less and less corn to be grown. If our statistics went far enough back, it would be very interesting, and to many people very surprising, to trace the magnitude of the diminution. To the community at large the change has been highly beneficial, as it has not only cheapened food, but has set free capital and labour for more productive employment. But to the persons and classes exposed to the competition it has been a hard battle; to the poorer and less skilful amongst them it has brought severe suffering.

Green crops have decreased about 2 per cent. as compared with last year, showing once again the influence of the prevailing depression; but, on the whole, the area under these crops has remained steady since 1870. The most decisive evidence of the agricultural depression is, however, afforded by the increase of bare fallow to which we have referred above. Since 1879 the increase has been 91,000 acres, or 12½ per cent.; and since 1870 it has been 202,000 acres, or over 33 per cent. It is unnecessary to add anything to what we have said above as to the significance of these figures. Passing, in the last place, to the number of live stock, we find a decrease in horses employed in agriculture—a further evidence of the number of farms unlet. And we also find a decrease in brood mares and young horses. What is less easily explained at first sight is the decrease of nearly 1 per cent. in milch cows, although other horned cattle have increased 2 per cent. As milk cannot be imported from great distances, while dead meat and fat cattle have been brought across the Atlantic, an increase in cattle for fattening, and a decrease in milch cows, are quite contrary to what we should expect. But it has been pointed out that the great increase in the import of cheese from America a couple of years ago frightened cheesemakers at home, and led many to break up their dairies. This is probably the true explanation. That there should be a decrease of nearly a million in sheep and of half a million in lambs, will surprise no one who is aware of the havoc made in our flocks by disease in the winter and spring. It is worthy of special notice that the decrease has occurred almost exclusively in England and Wales; the Scotch counties almost without exception showing an increase, especially in lambs, and the English counties bordering on Scotland also escaping loss. The explanation is that 1879 was a comparatively dry year in Scotland, that last winter and spring were exceptionally fine, and that the sheep disease was the consequence of wet. But the decrease in cattle, in the face of increased cultivation and increased pasturage, is a discouraging symptom.

THE WAGES OF LITERATURE.

M. ZOLA has published a volume of collected essays which cannot, of course, have a success like that of *Nana*. In his essays M. Zola merely explains his theory of literature; in his novels he illustrates his theory by pungent examples. In his essays he fulminates from his pulpit in the *Voltaire* against that terrible social evil, *le lyrisme*. He descends on Victor Hugo with the crushing remark that, after all, "he is only a lyric poet." In M. Renan, too, he detects that futile thing, a poet; and it is not to the purpose to reply that M. Renan has written little or no poetry. M. Zola has spoken, and M. Renan's place for the future is in the purgatory of poets. In agreeable contrast to the sickly sentiment of mere lyric poets and to the impertinences of such authors as Victor Hugo, M. Zola erects the majestic shapes of Science, of "Naturalism," and of himself. Literature is to be all science now, all physiology, and M. Zola is the prophet of the new era. It is true he often says "we" in speaking of the Naturalists, and he

seems to indicate the existence of a group of "those about Zola," young writers of his school. But the world has not recognized, or has shut its nostrils against, the fragrant literature of young Zolaistes. It is with the master himself that we must deal, listening respectfully to his haughty demand for "documents," and wishing humbly that he would not invariably look for documents in such very unspeakable places. To read M. Zola is almost enough to make one detest science—in whose name he does such remarkable things—and to read Mme. Deshoulières with pleasure. But there is one topic at least on which M. Zola speaks with some authority, and with good common sense.

That topic is *l'argent en littérature*, the wages of literature. M. Zola laughs at the absurd old theory which condemned men of letters to give away their works for nothing, and to be satisfied with glory. Never was there a poet yet that was content with glory without money. Byron mocked at Scott's gains, till his own works began to sell, and that has usually been the limit of poetical indifference to professional success. M. Zola, of course, is indignant with the critics who deplore that the modern writer has become a tradesman. He himself, as every one who chanced to be in Paris at this time last year must be aware, is a master in the art of advertisement. Big and little yellow placards, bearing the name of "Nana" in squat black letters, were the most remarkable among the mural decorations of the town. M. Zola has always made it clear that he did not agree with people who say "l'argent tue l'esprit." In his essay he tries, with some success, to demonstrate that the author lives better, and in a more dignified way, in an age of commercial naturalism than in a period of what he calls "idealism," and of patronage. With the modern side of the question M. Zola is very well acquainted. He now counts his editions by the hundred thousand, but the time has been, as he tells us here, when he starved in a garret. About the condition of authors in old days, about the relations of the classical French writers and their publishers, M. Zola is not nearly so well informed. He says that it is a question of "documents." So it is, but in this case the "documents" are not to be found in the *lupanar*, or any of the haunts of Nana, so this eminent man of science has but few to exhibit. In memoirs and letters the evidence must be sought, and the obscure history of the relations of authors and publishers has still to be written. M. Zola has looked into the *Historiettes* of Tallemant des Réaux, an ignoble and ill-natured scandalmonger of the seventeenth century. In the *Historiettes* he finds the anecdote of the King's inability to pension Malherbe, of the thousand crowns granted to the poet by M. de Bellegarde, the reduced pension given by Marie de Medicis, and so forth. Malherbe did not mind accepting a "tip" of four hundred livres, but he was indignant because his benefactor did not send a carriage to bring him to receive the money. De Balzac, who had land of his own, made it a point of honour to receive a pension. Sarrazin was a bullied, and Voiture a potted, parasite of the great; and it seems that M. de Noailles used to treat the eminent Chapelain as badly as if he had been a Court jester. Corneille was always poor, and La Fontaine was the pensioner of Fouquet, the Minister of Finance. La Fontaine was to receive a thousand livres yearly, in payment for delivery of a set of verses every quarter. The first set of rhymes is addressed by La Fontaine to Mme. Fouquet:—

> Comme je vois monseigneur votre époux
> Moins de loisir qu'homme qui soit en France,
> Au lieu de lui, puis-je payer à vous?
> Seroit-ce assez d'avoir votre quittance?

Pelisson, the secretary of Fouquet, gave La Fontaine a receipt in rhyme, a ballad on the same refrain as that employed by La Fontaine:—

> Muses de Vaux, et vous leur secrétaire,
> Voila l'acquit tel que vous souhaites.
> En puissiez vous en cent ans assez faire!

Madame Fouquet was made to say:—

> De mes deux yeux, ou de mes deux soleils,
> J'ai lu vos vers qu'on trouve sans pareils,

and so forth. The whole transaction may not have been very dignified, but dignity was not the strong point of good La Fontaine. M. Zola does not mention the affair, but no doubt he would condemn it in the sweet, tolerant spirit of scientific naturalism. Another old offender was Clément Marot, who begged a petition from Madame d'Alençon, in a "ballade, pour estre couché en son estat."

M. Zola attributes the somewhat servile position of the old poets to the want of readers. Except by way of patronage, there was no remuneration for a man of letters. We cannot help suspecting that it was less lack of public appreciation than of honesty in the old publishers that kept literary men dependent on the caprice of the great and the gratitude of kings. What we need is more documents about the old laws of copyright. Probably copyright was chiefly secured by the printer, by aid of Royal licences. If we examine the case of Ronsard, a poet of great popularity, it will be seen that, as far as patronage went, he did very well. The King gave him the abbeys of Bellezanne, Beaulieu, Croixval, and several priories. But towards the end of his life, in 1584, Ronsard had never received a penny from the booksellers who brought out his numerous works. Ronsard's letters are unluckily lost, but Colletet analysed some of them. "For the edition of 1584 he expects Buon, his publisher, to give him sixty crowns, that he may have firewood to keep him warm in the winter weather. And if Buon will not agree, he asks a friend to treat with the booksellers in the Palais, who doubtless will give him more than the sum mentioned if he puts a bold face on the matter, and demands a proper sum for the perpetual privilege of printing the volumes. And this privilege is the more remarkable as, nowadays, licences are only granted for a few years, and are not perpetual. The Ronsard remarks bitterly on the greed of publishers, who like always to take and never to pay." Unluckily the exact remarks of the "Prince of Poets" are lost. Rabelais is another example of an author whose works had an immense popularity and a most extensive sale, yet he never seems to have been a rich man, or to have derived much emolument from his success. And we can partly understand this when we read in Mr. Christie's *Life of Etienne Dolet* how that worthy "martyr" pirated the books of his friend. "It was with feelings of excessive but justifiable irritation that Rabelais, in 1542, found issuing from the press of Dolet, without his sanction or knowledge, an edition purporting to be augmented and revised by the author himself, in which all the obnoxious passages and expressions reappeared." Thus it seems that the state of the law of copyright, the knavery of booksellers, and the carelessness of authors, rather than the lack of readers, deprived the old writers of their legitimate gains. M. Zola says that Molière only made a competency—"gagnait strictement sa vie"; but the documents about the property left by Molière at his death prove the inaccuracy of this statement. Molière had his own troubles with the booksellers. In 1660 he had to obtain a decree from the Privy Council enabling him to seize a whole piratical edition of his *Cocu Imaginaire* in the house of Ribou, the publisher. He afterwards, with his usual charity, lent this fellow Ribou money when the publisher was in distress. The evidence of contemporary plays proves that Molière's pieces sold well when they were printed. As the author generally reserved his own property in them, it is not impossible that he may have profited by the sale of his plays no less than by their success on the stage. M. Zola dismisses the whole topic, on which his researches throw scarcely any light, with the remark that "novelists, poets, and historians were all the prey of the publishers." We think he greatly underrates the gains of the old writers for the stage, and even of the more popular writers of poetry and fiction.

With the modern condition of the man of letters, with the modern wages of French literature, M. Zola is naturally well acquainted. Every one, he says, can now afford himself a little library. In England it is not so; and before the age of circulating libraries people were greater buyers of books than they are at present. Still, even in France, almost every writer who has not a private income must begin with the daily toil of journalism. Twenty years ago even well-known men only received about two hundred francs a month from the papers; now they get a thousand francs, or more. This is not an immense income, but the French are economical. M. Zola thinks that any young fellow of talent and energy can add literature to his journalism, and find time to write books or plays. A book does not pay well, but it helps to make a man a name. Publishers, as a rule, pay a royalty on each volume, perhaps half a franc on one of the novels that sell for three francs and a half. At this rate, if a thousand copies sell, the author makes twenty pounds. Three or four thousand copies sold are considered a very respectable success. Thus eighty pounds is as much as even a sanguine young author can hope to gain by a novel. M. Zola does not say that his remarks are confined to works of fiction, but we rather pity the young journalist who hopes to make eighty pounds by work of any other sort. Let it not be forgotten that half a franc is rather an unusual royalty; forty, or even thirty-five, centimes are more commonly given. M. Zola says that the system of royalties makes disputes between author and publisher impossible—an ideal result. The stage pays much better, and a run of a hundred nights should mean a sum of forty thousand francs (1,600*l.*) for the author. A book must sell some eighty thousand copies to be as remunerative as a successful play. Only a few novels have had this vogue in the last fifty years, though even this rare fortune has fallen to the skilled and judicious industry of M. Zola.

The question naturally arises, are not the apprentices of literature spoiled by the rough-and-ready work of journalism, by which alone they can live in their early years of struggle? M. Zola thinks not. He thinks that the contact with facts and with the popular taste gives writers more energy, more knowledge of the world. This is a difficult question. It needs a strong man to be both a journalist and, in rare intervals of leisure, a writer of higher aims, the wielder of a style more refined. But M. Zola admits that he is only interested in strong men. Much depends on the aim of the beginner. He may mean to use journalism only as an instrument, and then may find that he can afford no leisure for more mature work. In that case, M. Zola, taking a wide philosophic view, would probably say that the struggler had found his place and had better make the best of it. He proves, by the examples of George Sand, Dumas, Sardou, and Hugo, that fortunes may be made by literature when the writer has genius. The born hacks must be content to remain hacks, and the odds are that they never had it in them to be anything better. One thinks of Théophile Gautier and his slavery to the press, and doubts the truth of this theory. It is sweeping, it is severe, perhaps heartless, but it is true on the whole, and recommends itself to the scientific student of the struggle for existence. "La vie est ainsi, notre époque est telle."

WIGTOWNSHIRE.

ENGLISHMEN who may happen to remember the lines of Burns appealing to all Scotchmen from John o' Groat's House in the north to Maidenkirk in the south, may yet need to be reminded that the latter, which is the most southern parish or district in all Scotland, is in latitude below Durham and parallel with the most northern angle of Yorkshire. Few tourists would think of lingering in Wigtownshire, or would bestow more than a careless glance on its alternations of flat moorland, low hills, and huge fields of oats and turnips, as they pass them on the Caledonian line in coming from or going to Ireland. An old author says of this part of the country that *in modicos colles tumet*: and at first sight there seems nothing picturesque or attractive in earthy protuberances as round as a potato, rising to about 100 or 150 feet, each crossed by one or more stone dykes from top to bottom, and calculated to perplex a casual visitor by their bewildering resemblance to each other. Wherever he turns in his anxiety to grasp the leading features of the country, he is met by one of these elevations, now and then crowned by a tuft of fir-trees, but oftener presenting no greater distinction than arises from the varying nature of the crop. On one hill there are fifty acres of corn or stubble; on another the same extent of turnips; and a third is pasture, or, as it is appropriately called, "white land." Yet, if Wigtownshire has no great natural beauty of its own, it commands distant views of singular breadth and variety, and it has certain features of which no county in England, and few in Scotland, can boast. No one part of it is more than thirteen miles from the sea. From certain points the eye can take in the Wigtown Bay, the Bay of Luce, and St. George's Channel. From almost every corner of it can be seen the long line of blue mountains which fringe the Stewartry of Kirkcudbright, including the Merrick, the highest peak in the south of Scotland. On a very clear day it is no exaggeration to say that the view extends from the Mull of Cantyre and the Island of Arran in the north to the mountains of Cumberland in the south, and from Lamachan and Cairnsmore in the east to the coast of Ireland by Larne and Donaghadee in the west. It is studded with the seats of landed proprietors who, for some generations, by planting and draining, have done their utmost to redeem the ugliness of nature and to improve the soil. Its farmers are probably, in skill, intelligence, and management, second, if at all, only to those of the Lothians; and it enjoys a climate which, in point of mildness, is quite equal to that of our Midland counties.

Locally, Wigtownshire is divided into three tracts. Geographically, it is cut in two by the Bay of Luce. The northern part of the county, adjoining Ayrshire, is known as "the Moors," and can boast of large tracts of heather and pasture as well as of mountains rising to the respectable height of a thousand feet. The second division is known as "the Machars," and properly comprises the tract between the two Bays of Wigtown and Luce. The upper district of "the Rhins" includes the part to the south of Loch Ryan and the west of the Bay of Luce. But these terms are often elastic. Local tradition, family records, and the present aspect of the country lead to the conclusion that most of the land has been broken up, enclosed, and converted from moorland to pasture and from pasture to arable, within the last century or so. One of the Earls of Stair in the beginning, and one of the Earls of Galloway in the end of that century, introduced various new crops, made roads, sheltered bare and bleak fields by belts of plantations, drained swamps, and cultivated lucerne and roots. Their example has been followed by other intelligent proprietors down to the present day. The staple crops are oats and turnips. Wheat is grown in some stiff clay soils, but not to a great extent. And cows of both the Galloway and the Ayrshire breed during the last fifty years have contributed to raise the reputation of the local dairies. There is a belief on the part of some proprietors and farmers in a six-course rotation or succession of crops —first oats, then turnips, and then oats again, followed by three years of hay or pasture, after which there is a return to oats. But these maxims are by no means universally adopted in practice. Sometimes we have a five and not a six-year course. Here and there wheat alternates with beans; some fields, aided by a little manure, continue to feed stock for many years in succession. Enclosures in which huge stones seem to predominate over clods yield magnificent returns, the farmers believing that the stones retain the heat of the sun; and it has been noticed that cereals on the southern slopes of the round hills already described ripen sooner than crops on the flats, because they catch the full glow of the sun. Dykes, it need scarcely be said, are more common than hedges or wire fences; and it might irritate Sir William Harcourt to be told that hares can co-exist with fine crops in considerable numbers without leading to complaints, and that not a few landed proprietors had settled the question of ground game amicably with their tenants before the late coercive legislation. Without boasting of a Highland abundance of grouse and black game, Wigtownshire is a county of sporting capabilities. But the remnants and strips of pasture and moorland in the very midst of arable farms have brought about some curious variations in the habits of feathered game. Partridges take readily to the heath, rushes, and ferns of the moors, and can be shot to dogs as late as October. Pheasants lay their eggs, bring up their broods, and roost on the bare ground in the same localities; and grouse and black game, to the amazement of the Highland or the Southron sportsman, are stalked on the stubbles or afford snap-shots between the ridges of the turnips and potatoes. A short time ago an ineffectual attempt was made to get up a pack of fox-hounds somewhere between the parishes of Whithorn and Penninghame. But the country not being favourable to what the Baron of Bradwardine would have termed the true points of the *prælium equestre*, the attempt failed, and the failure is hardly a subject for regret.

The introduction of railways has had some peculiar effects in this county and in the adjoining Stewartry of Kirkcudbright. Small towns, such as Dalbeattie, Castle Douglas, and Newton-Stewart, have received a certain impetus from the Caledonian Railway, and the county towns of Kirkcudbright and Wigtown at one time appeared to go back. But of late years branches have connected these places with the main line. The isolation, however, of the two peninsulas into which Wigtownshire is naturally divided, still remains. From the Isle of Whithorn to the Mull of Galloway would by packet or sailing-boat be no long trip. No less than fifty or sixty miles separate these two places in a roundabout journey by land, and the southern part of Kirk Maiden—for Maiden Kirk was probably used by Burns for metrical conveniences—is still some fifteen miles from the nearest station of Portpatrick. Kirk Maiden, we should note, is by the best local antiquaries believed to be the church of St. Medan, and not that of the Virgin Mary. The number of places to which the word Kirk has been applied as a designation is legion. Kirkcowan, Kirkinner, Kirkmabreck, Kirkgunzeon, Kirk Michael, and many others in the Western Lowlands, are a delight to antiquaries, and a worry to correspondents and postmasters.

A dissertation might be written on the Jena Œstuarium of Ptolemy, supposed to be the Bay of Wigtown; on the point to which Agricola came north in his Scotch campaigns; on the predominance of the Norwegian and the Celtic elements in Galloway and its neighbourhood; and on the fierce and intractable character of its inhabitants in the twelfth and thirteenth centuries. We leave these topics, and prefer to say a word or two about some of the archæological remains which have engaged the attention of men like Sir John Lubbock. Notably in two places in Wigtownshire we find those monuments which are popularly and most expressively designated as "standing stones." They are found in the parish of Wigtown, on the road between that town and Kirkcowan, and in the parish of Mochrum, not far from Monreith Park. The latter are less perfect in the circle than the first-named at Torreskie. They have been variously ascribed to the Phœnicians, to the sons of Anak, to some antediluvian race, to King Galdus, who reconquered the province from the Romans and who is said to be buried there, and to the Druids who used the stones either for sacrificial temples or for courts of justice. The circle at Torreskie, in full view of the high road, consists of nineteen stones, with three larger stones in the centre; and at places to the north, east, and south are separate erections of two or three stones. The connexion between these outposts and the main circle is mysterious, like the rest. One of the largest of the stones, popularly known as the porridge-pot of King Galdus, has been carried off to repair the dyke which lines the high road, and to this transfer, which at first sight savours of Vandalism, the monument probably owes its security. To us the hollow in this stone is suggestive of a sacrificial bowl to receive the blood of victims. On the whole we prefer the sacrificial theory, but have no decided opinion to maintain. Less uncertainty attaches to Dowalton Loch in the parish of Sorbie. When the loch was drained, pile-houses or lake-dwellings were disclosed, with accompaniments of the bones of the ox, the pig, and the deer; besides five canoes, glass beads, sundry vessels of bronze, whetstones, and even a bit of a "leather shoe with a pattern stamped on it." The hoary antiquity of this last treasure we may be pardoned for doubting. The ruins of the old church at Whithorn, at no great distance from the loch aforesaid, remind us that it was a great place of pilgrimage in early Scottish history. Whether Whithorn be a corruption of the "white house," and whether this again can be identified with the *candida casa* of the Romans and the *Leucophibia* of Ptolemy, are questions controvertible; but there is no question that the church was founded in the eighth century or so by St. Ninian; that pilgrims, amongst whom were high-born dames and queens, flocked there from the foundation of the Church down to the Reformation; and that James IV. regularly went to Whithorn, some say twice every year, when doubtless, as in Scott's lines—

> he felt
> The pressure of his iron belt
> That bound his breast in penance-pain
> In memory of his father slain.

An old Saxon arch in an excellent state of preservation is still to be seen in the ruins of the Priory, and a street called by the name of Rotten Row is said in the guide-books to be a corruption of *Route au Roi* or *Route aux Roues*. The former, it is needless to say, would be bad French for the King's Road, and the latter is scarcely intelligible. Persons not familiar with this locality will bear in mind that Whithorn and the Isle of Whithorn are two very distinct places. The latter, though not the most southern point, is the most southern village in Scotland, and has long ceased to be an island. The narrow channel between what once was a rocky isle and the mainland has been filled up by a stout causeway, on which substantial houses are built. A life-boat is now drawn up on the tongue of the peninsula, which has the singular advantage of slopes to the west and to the east, so that,

in almost any weather, the boat can be launched with ease in comparatively smooth water. That there should be not far off a cave on the rocky beach known as St. Ninian's, to which this father of the Church was in the habit of retiring for meditation, is a local tradition which we are bound to accept in good faith. In spite of the attractions of some Roman remains, a genuine old castle or two, and a splendid view seaward, this part of the country is as dull and uninteresting as Huntingdonshire or the Fens. In fact, the picturesque portion of Wigtownshire is confined to the north; mountains become hills, and hills mere undulations, as the land tapers away to Burrow Head and the Isle of Whithorn.

It may be a subject of regret that Scott never visited Wigtownshire, though he went through Galloway on legal business about the year 1798, and turned his recollections to good account, some twenty years afterwards, in *Guy Mannering*. But the *Bride of Lammermoor* came direct from Baldoon, a rich farm lying on the south or right bank of the Bladnoch and on the shore of Wigtown Bay. Dunbar of Baldoon, the younger, became Scott's Hayston of Bucklaw. The bride, it is well known, was Janet Dalrymple, daughter of the first Lord Stair. According to tradition and to a contemporary account by the Rev. Mr. Symson, then minister of Kirkinner, not much more than a mile from Baldoon, the bride was brought to her home twelve days after the marriage had been solemnized, on the 24th of August, 1669, and she died on September 12th. The said minister, we are told in a local guide-book, spoke "highly" of both bride and bridegroom. We are wholly unable to spoil a tragical and pathetic story by lending credit to a rumour that the tale worked out so powerfully by Scott is due to Jacobite enmity and spite, and that the sole foundation for the tale is the premature death of the bride just a month after her marriage. Of Baldoon Castle, where she was found "mopping and mowing" and "her night gear dabbled in gore," nothing remains but part of a tower and an old wall covered with ivy. There is a modern farm building, and the carse or land reaching to the foreshore is renowned for its fertility. Two other places in Wigtownshire deserve a slight mention. At Logan, in the parish of Kirkmaiden, there is a natural fishpond of salt water, which, by a very simple device, keeps in cod and coal fish, and lets the tide flow in and out. It is said that some of the fish become blind from excess of light, a danger of which proprietors of aquariums are fully sensible. At Mochrum, on the lake of that name, a mediæval castle long in ruins has been partly rebuilt on the old lines, nothing being altered in the thickness of the walls and the staircase, and very little in the holes or "casements" which admit the light. Happy is the country in which the fancies and whims of wealthy proprietors take no worse shape than the conversion of a ruined baronial castle into a residence which no modern grates, or bedsteads, or other domestic conveniences, can divest of its innate dreariness and discomfort.

A description of a county which was long the nurse of uncompromising Whiggery would be incomplete without some mention of the celebrated Wigtown martyrs, whose tombstones, like those of many of the Covenanters in the churchyards of Galloway, are still to be seen in the burial-ground of Wigtown. A pillar has also been erected to their memory on a hill just above the town. Some ten years ago an attempt was made by the late Mark Napier, Sheriff of Dumfriesshire, to prove that neither Margaret Lachlison or Lachland nor Margaret Wilson was ever drowned on the 11th of May, 1685, as related by Woodrow and re-affirmed by Lord Macaulay. Two pamphlets, in which the man of law—in language, we regret to say, almost unsurpassed for virulence—endeavoured to make out that the whole story was a spiteful invention, were taken up and answered by Principal Tulloch, and with greater effect by the Rev. Archibald Stewart, late minister of Glasserton. We have no space to go fully into the details, but, having just re-read the whole controversy on the spot, we have no hesitation in stating our belief that the divine has completely demolished the arguments of the lawyer. Mr. Napier for a short space triumphed in the discovery of a document of the Privy Council which seemed to speak of the two women as being in Edinburgh Tolbooth shortly before the date of their alleged martyrdom at Wigtown. Mr. Stewart successfully explained away this new evidence, and further showed the incontestable truth of the martyrdom by pamphlets published soon after 1685, and by written statements formally made and recorded and never contradicted, within a quarter of a century of the date of the event. One of these unfortunate women lived in the parish of Kirkinner, and another in that of Penninghame. The members of the Kirk Session of both these places went fully into the cases in the year 1711, reviewed the whole evidence, and made formal minutes, as they expressed it—*ad futuram rei memoriam*—in their session books, closing the *sederunt* with prayer. Scotch divines in the eighteenth century may have been narrow-minded and stern in their denunciations of Popery, Prelacy, Erastianism, and so forth; but that members of so grave a body, whose names, residences, and titles are all fully ascertained, should have combined together to make up lying records of what they must have known never took place at all, is a supposition which cannot be entertained for a single instant by any one who really knows for what truthful qualities Scotch elders and ministers are usually distinguished. In a matter of fact we would trust an attested statement of a Kirk Session as we should the evidence of the Lord Chancellor or the word of the Archbishop of Canterbury. We suppose that the most astute lawyer would hardly contend that the truth or falsehood of a statement made by a similar body in the present year with regard, let us say, to something which happened in the time of the Crimean war, could not be readily ascertained. Just that difference of time separates the martyrdom and the solemn records we have mentioned. As Lord Macaulay said about another and yet undecided controversy, if these pieces of evidence do not settle the question, there is an end of all such reasoning. We close our account by remarking that in parts of Wigtownshire there is a considerable element of Irish settlers. When removed from the baneful influences of Land Leagues, ferocious orators, and unscrupulous priests, these men become useful and quiet members of the community. In some instances they have been the first to break up hill pasture and moorland; and we have not yet heard that they clamour for fixity of tenure or crofts to be held rent-free. In fact, it requires very close attention to the revelations of the daily papers and some little flight of imagination to realize the fact that a narrow passage, less in width than the Straits of Dover, separates the loyal and intelligent population of a rich Scotch county from an island characterized by a state of riot and insecurity which would not be tolerated for a week in Eastern Bengal or on the frontiers of the Punjab.

THE MOLIÈRE WEEK AT THE THÉÂTRE FRANÇAIS.

THE circumstances attending the annual "Cérémonie de Molière" at the Comédie Française have been so frequently described that it may be doubted whether any reference to them is necessary in these columns; suffice it to say that the performances given upon the occasion invariably attain a very high pitch of excellence. But this year it was determined that an unusual amount of care should be lavished upon the festival of the man to whom the house of the Rue de Richelieu owes its origin; and the 22nd of October, on which day the Molière week commenced, was anxiously looked forward to by all the playgoers of Paris. It may not be amiss to look through the programme of the pieces given, which contains features of unusual interest:—

Thursday.	*Monday.*
Le Misanthrope.	L'Avare.
L'Impromptu de Versailles.	Le Malade Imaginaire.
La Maison de Molière.	La Cérémonie.
Friday.	*Tuesday.*
Les Femmes Savantes.	Iphigénie en Aulide.
	Les Plaideurs.
Saturday.	*Wednesday.*
Horace.	Tartufe.
Le Menteur.	L'Impromptu de Versailles.
	La Maison de Molière.
Sunday.	*Thursday.*
La Cérémonie.	Le Bourgeois Gentilhomme.

Among these we select the following for comment—*L'Impromptu de Versailles*, *Le Misanthrope*, *Britannicus*, and *Les Plaideurs*.

L'Impromptu de Versailles, which had only been given three times in the last two centuries, was undoubtedly the chief source of attraction. As this piece has been so rarely played, it may be well to give a brief sketch of it and of the circumstances which led to its production. Of the quarrels between Molière and the opposition troupe of the Hôtel de Bourgogne, it is not our intention to speak in these columns; but it is well to bear in mind the degree of exasperation occasioned among the great poet's enemies by the production of *La Critique de l'École des Femmes*. Eager for revenge, they attempted to oust him by the publication of De Villier's *Zélinde*, which was a laborious enumeration of all the grievances harboured against Molière by his many detractors. But the piece was so cumbersome that it was judged impossible to represent it on the stage, and in its stead the comedians of the Hôtel de Bourgogne produced *Le Portrait du Peintre*, written by Boursault. The critics of the time seem to have thought that Molière received a very cruel blow from it, and the following quotation was considered especially crushing:—

> Eh! parlez, dépêchez, vite, promptement, tôt!
> On appelle cela réciter comme il faut.
>
> * * * * * *
>
> Baron, ouf! que dis-tu de cet ouf! placé là?
> Par ma foi, cher baron, il faut voir tout cela.

"Vite, promptement, tôt, le déconcerta," says a contemporary, "et le ouf! lui fut un coup de massue dont il est encore étourdi"; but at the present moment it is impossible to believe that such weak nonsense could have hurt anybody, much less Molière, who, as long as he pleased the King, seems to have cared very little what any one else thought of him. Accordingly we find that he intended passing over the attack in silence, and that it was the King who insisted upon his replying to it in *L'Impromptu de Versailles*. In the play itself there is abundant evidence that Molière wrote it against his will, for he repeats many times that it is written by the King's order. Having said this much, we may pass on to the play itself, which is, perhaps, the most ingenious in construction of any that he wrote. The whole action of the piece takes place in the "Salle de la Comédie" at Versailles, and the curtain rising discloses Molière himself summoning the actors and actresses of his company to rehearsal. The greatest consternation prevails, for none of them know their parts, and they will have to play before the King two hours hence. It is in vain that Molière storms, for they all declare that they cannot be ready in time to act that day. It is in the midst of a dispute

upon the subject between Molière and his wife, who, it will be remembered, acted in his company, that Mlle. Béjart says, "Mais puisqu'on vous a commandé de travailler sur le sujet de la critique qu'on a faite contre vous, que n'avez-vous fait cette comédie des comédiens, dont vous nous avez parlé il y a longtemps?" Molière answers that he had not thought it worth while to reply to the attacks made upon him, and that he had not sufficiently studied his rivals to enable him to make a finished satire upon them. But he is led on to speak of a piece that he had meditated writing on the subject. "J'avais songé une comédie," he says, "où il y aurait eu un poëte, que j'aurais représenté moi-même, qui serait venu pour offrir une pièce à une troupe de comédiens nouvellement arrivés de la campagne. Avez-vous, aurait-il dit, des acteurs et des actrices qui soient capables de bien faire valoir un ouvrage? Car ma pièce est une pièce. . . ." He then asks who acts the kings among them? and being shown a handsome young man who generally enacts the kings, he indignantly exclaims, "Vous moquez-vous? il faut un roi qui soit gros et gras comme quatre; un roi, morbleu! qui soit entripaillé comme il faut; un roi d'une vaste circonférence." He consents, however, to hear the actor recite, which he does in a natural manner, free from stage affectation; whereupon the poet bursts out with "Comment! Vous appelez cela réciter? C'est se railler; il faut dire les choses avec emphase? Ecoutez-moi." And the poet repeats the lines which the actor recited. This gives Molière an opportunity of caricaturing the exaggerated manner of Montfleury, the tragedian of the Hôtel de Bourgogne, whose vast size, it may be remembered, has been handed down to posterity by Cyrano de Bergerac, of whose life and writings we have already had occasion to speak, and who once said of him, "A cause que ce coquin est si gros qu'on ne peut le bâtonner tout entier en un jour, il fait le fier." In the same manner Molière is enabled to satirize all the other actors in the rival company, having done which he breaks off in the midst of his digression and returns to the business of rehearsing for the piece to be given that day before the King. He hurriedly instructs the actors in their parts, taking one of the parts himself, and the rehearsal begins; opening the way for a spirited attack upon his remaining enemies, the poetasters and the fashionable people who were seeking to revenge themselves on him for his satire of them. Here, again, he avails himself of an opportunity of showing that the King had overruled his own judgment, for some of his enemies being represented in the scene discussing the chances of his replying to the *Portrait du Peintre*, one present is made to say, "Ma foi, je le trouverais un grand fou s'il se mettait en peine de répondre à leurs invectives." Later on, too, when Mlle. Béjart interrupts the rehearsal to suggest that Molière should make an attack on the author of the *Portrait*, he replies, "J'enrage de vous ouïr parler de la sorte . . . le beau sujet à divertir la cour que Monsieur Boursault!" But rehearsal and commentary are now cut short by the arrival of a servant, who warns the company that the King is waiting for them; whereupon a general panic takes place, in the midst of which comes a most grateful message from the King, saying that, as they are not ready, he will allow them to postpone the new piece to a later date.

Those who had the good fortune to be present on Thursday, the 22nd, on which occasion the *Impromptu* was given after the *Misanthrope*, can bear testimony to the marvellous perfection both of the acting, and of the mounting of the piece. Of M. Coquelin's Molière it is impossible to speak too highly. Two months devoted to laborious study of the character have enabled him to obtain a mastery over its most subtle shades, and the artist's wonderful versatility has never before been seen to such advantage. Of the perfect rendering of the humorous passages it is unnecessary to speak, but we cannot pass in silence over his noble delivery of Molière's indignant allusion to Boursault's attempts to blacken his character, in the speech beginning "Vous êtes folle. Le beau sujet à divertir la cour que M. Boursault," which is too long to be quoted here. His directions to the actors were also admirable, especially his delivery of "Pour vous, je n'ai rien à vous dire," addressed to Lagrange, which was eagerly seized by the audience as an occasion for paying a graceful tribute to M. Delaunay, who filled the part so well that we regretted that, though an important one, there was so little of it. M. Worms's Brécourt was a thoroughly good piece of acting, which it seemed to us was hardly sufficiently recognized by the audience. Of the ladies' parts there is little to be said beyond the fact that they were ably filled, especially the Mlle. Du Parc of Mlle. Croizette, of whom we shall have more to say in the *Misanthrope*. Apart from its historical interest, the *Impromptu de Versailles* was a brilliant performance, and we trust that it will now take its place in the repertory of the Comédie Française, from which it has unfortunately been so long banished.

Of the *Misanthrope* we do not propose to say much, as its performance in London has made it familiar to English playgoers, and as the cast has not been materially altered since it was given at the Gaiety in 1879. M. Delaunay continues to fill the part of Alceste, his reading of which we believe, as we have said on a former occasion, to be the right one, but he seems to us to fulfil all its requirements more perfectly than he did in London. He is rather quieter and employs less gesticulation in the earlier scenes than formerly; and in the scene with Oronte in the first act a certain amount of humour is mixed with his displeasure, so that, despite its vileness, we can hardly help being amused with the bad sonnet. He seems to repeat the old song—

> Si le roi m'avait donné
> Paris, sa grand' ville.

rather for himself than for his auditors, and his repetition of it struck us as one of the best things he has ever done; we have seldom heard such a burst of applause at the Théâtre Français as that which greeted its last line. In his scenes with Célimène there is more tenderness than there used to be, which we think is an improvement, as it enhances the contrast between her vain heartlessness and his constancy. His offer to marry her after the reading of her letters in the last act was touching beyond expression, and his casting her off in the speech

> Non, mon cœur à présent vous déteste

attained to the noblest dignity. We have never seen this great artist make so perfect an exhibition of his strength and of his fineness as he did in the whole performance of the part of Alceste. On Mlle. Croizette's Célimène we have also nothing but praise to bestow; she has made decided progress in the part, and her scene with Arsinoë was especially excellent. Her chief success in a performance in which she was much applauded was her delivery in the same scene of the long speech commencing

> Madame, j'ai beaucoup de grâce à vous rendre.
> Un tel avis m'oblige, et, loin de le mal prendre,
> J'en prétends reconnaître à l'instant la faveur.

We wish we could speak as highly of Mme. Favart's Arsinoë, but it showed a distinct falling off, and was much marred by exaggeration. Mme. Broisat's Eliante, on the contrary, gave evidence of higher qualities than we had formerly supposed her to possess, and she called forth a just admiration for the delivery of many of her speeches.

The evening was brought to a close by M. Got reciting *La Maison de Molière*, written by M. François Coppée for the occasion. It is the privilege of skilful orators to be able to give weight to phrases which have not much intrinsic value, and M. Got's consummate declamation infused a vigorous spirit into M. Coppée's didactic Alexandrines. The busts of Molière, Corneille, and Racine occupied the back of the stage, the entire strength of the company being grouped on either side. The staircases and entrances were picturesquely decorated in honour of the opening night of the week. We cannot give a better impression of the whole effect than that conveyed by a remark overheard in the Foyer:—"Tout cela a un air de bonne maison qu'on ne trouve pas ailleurs."

On Tuesday, the 26th, when *Iphigénie en Aulide* was to have been given, the programme was unavoidably changed, owing to an indisposition of Mlle. Barthet. Accordingly it was replaced by *Britannicus*. Both Mme. Favart in the part of Agrippine and M. Mounet-Sully in that of Néron were new to us, and although we regretted not seeing M. Mounet-Sully in his old part of Britannicus, we were curious to see how he would interpret the character of Racine's Néron. We were rewarded above our expectations, for the performance was a singularly fine one, although unequal in parts. We confess to having been disappointed at his first appearance, which failed to produce its proper effect, through his excess of gesticulation; but this was, no doubt, due to nervousness, for this fault was rarely to be observed after the end of the first sentence he had to speak. His treatment of Néron was most striking, breaking, as it did, with all the traditions of the past. Instead of the violent, uncontrolled tyrant to whom we have been accustomed, he exhibited him to us as a man of furious, but suppressed, passion; taking a demoniacal pleasure in causing suffering, and finding an unbounded source of cat-like delight in treachery. At certain moments every look and gesture were suggestive of a tiger about to spring, and, in the few instances in which his passion burst its bonds and showed itself openly, he was truly terrible. One of the most striking instances of this was in the scene in which he declares his love to Junie, and extorts from her the avowal of her passion for Britannicus, and of which we quote a fragment:—

JUNIE.

* * * * * *

> Il ne voit dans son sort que moi qui m'intéresse,
> Et n'a pour tous plaisirs, seigneur, que quelques pleurs
> Qui lui font quelquefois oublier ses malheurs.

NÉRON.

> Et ce sont ces plaisirs et ces pleurs que j'envie,
> Que tout autre que lui me payerait de sa vie.
> Mais je garde à ce prince un traitement plus doux :
> Madame, il va bientôt paraître devant vous.

JUNIE.

> Ah, seigneur, vos vertus m'ont toujours rassurée.

NÉRON.

> Je pouvais de ces lieux lui défendre l'entrée ;
> Mais, madame, je veux prévenir le danger
> Où son ressentiment le pourrait engager.
> Je ne veux point le perdre ; il vaut mieux que lui-même
> Entende son arrêt de la bouche qu'il aime.
> Si ses jours vous sont chers, éloignez-le de vous.

The assumed interest in Britannicus was most wonderfully given. "Je ne veux point le perdre" was pronounced in a tone of melting tenderness, in strong contrast with the look of devilish enjoyment in his face at the thought of the unexpected pain he was about to cause; and the unbridled ferocity that flashed out in voice and gesture at the line "Si ses jours vous sont chers" could not have been better rendered or have produced a stronger effect. Very admirable, too, was the scene in which he surprises Britannicus at the feet of Junie. His stealthy approach, and the calm irony with which he addressed Britannicus, sent a shudder through one. But the scene in which he proved himself truly great was that in

which his mother upbraids him in the celebrated tirade in one hundred and eight lines. His acting throughout the scene showed true genius, and his answer to her, beginning

Je me souviens toujours que je vous dois l'empire,

was superbly rendered throughout. This pitch of excellence was sustained by him to the end of the play; and we may say that, despite an occasional tendency to over-gesticulation, his acting throughout was that of a great tragedian. Mme. Favart, by her noble acting in the latter scenes of the play, more than compensated us for her monotonous delivery and "stagey" interpretation of its earlier portions. M. Volny's Britannicus was meritorious but feeble, and Mlle. Dudlay's Junie never rose above mediocrity. We cannot end our account of *Britannicus* without bestowing a word of praise upon M. Maubant's fine delineation of the part of Burrhus, which materially contributed to the success of the play. Space will not allow us to say much concerning *Les Plaideurs*. Those who have seen it will remember how perfect its performance always is at the house of the Rue de Richelieu. M. Got surpassed himself and kept the house in a continual roar of laughter. M. Delaunay acted like a man of infinite talent and experience, and looked like a young man of one-and-twenty. Mlle. Jouassain was as good as ever in the Comtesse, and there is a marked improvement to be noted in M. Coquelin cadet, who took the part of Dandin; his "Je veux aller juger" was irresistibly comic. On the whole, it seems to us that we have never before been more heartily delighted with any performance we have witnessed at the Maison de Molière.

GLADSTONE FANCY STATIONERY.

WE had the pleasure, not long ago, of calling attention to a new means of exalting the moral tone and quickening the religious sentiments by means of writing-paper. All persons who are given to letter-writing, or indeed to writing of any kind, will be glad to hear that their political principles can be taken care of in a somewhat similar way, means for the purpose having been provided of a much more varied character and calculated to exercise a much more delicate force of appeal. The Christian Pilgrim Note Paper has, a correspondent assures us, received its completion in the Gladstone Fancy Stationery. But the devisers of this latter invention have gone far beyond those of the former. The Christian Pilgrim Notepaper is not, as far as we are aware, advertised to be made out of the rags which have been worn on the sacred persons of specially Christian Pilgrims in times present or past. The Gladstone Fancy Stationery is constructed of sycamore wood hewn by the Premier's own hands in his own park. It is thus almost impossible that virtue should not go out of it in the mere handling, even as the Arabian prince was cured by drugs cunningly concealed in the handle of a mallet. The wood has been in direct communication—through the brief intervening substance of the axe head and helve—with the Premier's own hands, and it is, therefore, as well qualified to exercise all possible virtues as the best-authenticated relics. Its enterprising manufacturers have, we are told, bought all the wood, but they wisely warn their intending customers that there is no time like the present. Between Naval Demonstrations and Irish prosecutions, Mr. Gladstone will hardly find time to exercise the axe with frequency sufficient to supply the demand, and all persons are therefore recommended to buy early and buy often. We must say, indeed, that we can hardly think it fair that private persons should be allowed to absorb commodities so precious. A set of Gladstone Fancy Stationery might with propriety find a home on the writing-tables of every Liberal Club. A horrid idea even suggests itself, that it might be worth while for some bold and devoted Liberal to introduce sets—disguised, if necessary—into the dens of Conservative Associations, that so their healing and converting effect may be exerted insensibly upon the enemy. But for a private person to have a Gladstone Paper-Cutter, a Gladstone Letter-Rack, a Gladstone Blotting-Case, a Gladstone Card-Case, and frames for holding portraits of the Premier in the very act of getting the raw material ready—this is too much. It is wasteful and ridiculous excess, and ought surely to be abstained from.

The list of items of this surprising stationery which our correspondent has been good enough to send us illustrates pleasantly the progress of modern refinement and even of modern luxury. When the misguided Mr. Timmins gave his Rosa that Davenport which worked such woe, paper, pens, wax, and little note-books exhausted the list of equipments which his cultivated and enamoured soul could think of. Had he lived thirty years later and been of the right political complexion, he would have adorned or encumbered that desk with the Gladstone Visiting-Cards, the Gladstone Card-Case to hold them, the specially appropriate Gladstone Post-Card-Rack, the Gladstone Paper-Knife, the Gladstone Letter-File, the Drawing-Stand, the "Papeterie" (which we understand to be trade French for paper-rack), the Music-Case, the Music-Carrier, the "Blotter," all bearing, and with the best of rights, the sacred name. Thus the remembrance of the idol can be carried into nearly as many relations of life as those remembrances of other idols which used so dreadfully to embarrass the early Christians. It can travel about with us in a card-case; it can scornfully tear wicked Tory prints and gently reveal the mild wisdom of the elect as a paper-knife; it can remove superfluous ink from hasty and fervent letters to the beloved (preserving correct copies of the same for the edification of future scoffers) as a "Blotter." As a letter-file, collectors of autographs may associate with it the epistles in which forty years ago Mr. Gladstone used to inform his correspondents that the only hope of the country was in Conservatism, and those in which at the present day he informs them that the only hope of the country is in Liberalism. The portrait-frames can enshrine counterfeit presentments of him as elected (and as rejected) by most English constituencies; and the music cases might possibly, with the aid of an expert composer, be made to contain representations of his unequalled faculty for singing different tunes at different times. Upon the happy, but, as we have suggested, somewhat selfish, man who decorates his writing-table with all these curiosities the effect which they exert ought to be indescribably suggestive, independently of the occult influence which they should, according to the best authorities in hagiology, be able to exercise. The varied scenes of a career of unexampled variety should rise up before him, and instructive parallels and conjunctions crowd into his mind. There is no need to particularize these; but it may be at least suggested that the "Blotter" will make him think of the facility with which Mr. Gladstone blots out his own announced convictions, and the knife of the prompt and ready vengeance which he knows so well how to exact from those who offend him.

It is with particular pleasure that we are able to inform our readers that no improper or surreptitious means have, according to our informant, been used to obtain this great boon for the people of England. There have been saints, we believe, who have rather objected to the carrying off of relics or talismans by enthusiastic worshippers. Saint Simeon of the Pillar was, if we may trust the Laureate, above these foolish scruples—we do not intend an idle jest by this—and so is Mr. Gladstone. Our correspondent has forwarded to us a document which, if it be not an actual facsimile of a letter from Mr. Gladstone's private secretary, is a very audacious and a very adroit imitation of one. Mr. Gladstone expresses his "best thanks," he says, that "the specimens have afforded him much interest," and that "the workmanship appears to him to be most satisfactory." He does not, indeed, quite echo the words of the other person who was set in a high place by suggesting that the Gladstone Fancy Stationery may "aid all this foolish people," that they may "take example, pattern" by him who hewed the sycamores, and that so they may be brought to the Radical light. But it is fair to presume from his reported acquiescence in the proceeding, his gratitude to the workers, and his approval of the workmanship, that the idea seems to him not a bad one. There have been statesmen (just as there have been saints) who might have taken a different view. These churlish persons would probably have written to this effect:—"Gentlemen, I can't prevent you from making any use you please of the wood you have bought, nor can I prevent any idiots from purchasing the things you make out of it. I have, however, given orders that in future every chip of my axe is to be burnt or used up at Hawarden. You will doubtless receive this information with equanimity, as it will add to the value of your wares." This is what some men might have written, no doubt unwisely. It deserves to be very frankly and cordially acknowledged by Mr. Gladstone's least enthusiastic admirers that he has an excellent measure of the foot of a certain not insignificant portion of the British public. With another portion he is perhaps not quite so much at home. But he quite understands those with whom he has chiefly to deal. No injudicious refuser of wreaths is he; no churlish grudger of the simple pleasures of the people. We cannot somehow imagine Mr. Gladstone reading the *Book of Snobs* with interest or appreciation. Painful glimmers as to his encouragement in his worshippers of the vices therein censured would probably come across him—unpleasant half-lights, which his mental eye could not wholly blink. It is true that, like Warren Hastings, he would undoubtedly have the satisfaction of looking into his own heart and convincing himself of his innocence; but still he would probably think it wise not to expose himself to the necessity of such introspection. The artless compositions of the manufacturers of Gladstone Fancy Stationery, the chaste tributes of the donors of silver axes, must be much more to his taste.

It is rather odd that, just as all the world is complaining of the decay of letter-writing, benefactors of the public should choose this particular function as the one at the performance of which the hearts of men are to be caught warm and tender and moulded to noble uses. "How very hard it is to be a Christian," sings or sighs Mr. Browning, and a cheery man of business answers, "Not at all; buy some Christian Pilgrim Notepaper, and the thing is done." "How very hard it is to be a Gladstonian," sings or might sing some unpublished bard, and he too is met by the prompt reply, "Write your letters under the immediate influence of Gladstone Fancy Stationery, and all the rough ways shall be made plain to you at once. You shall not wonder at Naval Demonstrations with the guns warranted not to go off, neither shall you lose yourself in intricate problems of proportion in which the terms are sergeants of police, Irish churches, peers of the realm of Ireland, and land laws for the protection of the property and persons of the lieges. A Gladstone fancy papeterie or a paper-cutter of the genuine Hawarden sycamore will make it all smooth and easy." The only thing that grieves us somewhat is that the precious material has not been made into more precious objects. The wood of the True Cross—and persons with a good historical memory may be asked to remember that we are not respon-

sible for the invention of the parallel—has been profanely said to exist in quantity sufficient for the building of a three-decker; but we do not remember that it was ever used for the manufacture of papeteries. The Hawarden sycamores should surely have been committed to those excellent goldsmiths and silversmiths who pine for some worthier occupation than the nufacture of spurious Queen Anne plate. Reliquaries of every n and size should have been fashioned for its reception. Blotters and papeteries are all very well; but really, if this is the modern fashion of honouring saints, we shall expect shortly to see advertised the Gladstone Lucifers—wood warranted to come from Hawarden—or the Gladstone Fire-Lighters, in bundles of five hundred. Indeed there would be a certain appropriateness in these applications. The affectionate devotees of the best of Premiers have not, so far as we know, ascertained or published exact statistics of the amount of cords—we think that is the correct term—of wood which Mr. Gladstone cuts down annually, but it must be considerable. There is no knowing to what vile uses the sacred wood might come if it be too freely worked up. But still its sale, if it have a sale, must, like that of the photographs of distinguished persons in the shop-windows, greatly comfort Mr. Carlyle in his old age. The people at large has come round to hero-worship, and pursues the cult in the most affecting as well as in the most strictly orthodox and traditional manner. It is true that there is a suspicion of the commercial element about the Gladstone Fancy Stationery. But every people has its ways, and the ways of Great Britain, as all men know, do sometimes a little smack of the shop. It must be seldom that the shop witnesses a more touching ceremony than the purchase, with hard-earned pennies, of a Gladstone Blotter by a fervent Radical. Let us hope that no heartless tradesman will delude that trusting one with false sycamore cut down by another than the venerated hand.

AUTUMN OUTSIDE THE FOG.

PEOPLE who are confined in town in the late autumn have, it must be allowed, good cause to complain. If ever there is a time when London is physically insupportable, it is now. The discomforts naturally incident to the season—such as the exchange of mellow warmth for raw nipping cold, and the gloomy narrowing of the day—are multiplied by the unnameable nastinesses of the London fog. Happy are they who have the opportunity to fly from this accumulation of miseries to a clearer, sunnier air, and wise are the few who, quite content to stay in town when town is pleasant, arrange for an autumn flitting when the multitude have ended theirs. To the unfortunate ones who would be glad, if they were free, to escape from the inclemencies of late October and November, we are able to offer a word of comfort. Nowhere in England, perhaps, are the beauties of autumn, when

> the fading many-colour'd woods,
> Shade deepening over shade, the country round
> Imbrown,

more lavishly spread before the eye than among some of the chalk hills of Surrey, which are reachable in less than an hour from town. And one can hardly conceive circumstances better fitted to intensify by contrast the enjoyment of autumn's glowing colours than the murky atmospheric surroundings of London at this season.

We will suppose that a harmless inhabitant of our fog-invested metropolis, much tormented by its noxious properties, takes an early train and reaches the neighbourhood of Dorking at about eleven o'clock in the forenoon. The pure country mist, more beautiful by contrast to the smoky mixture left behind, still hovers in fleecy drifts over the hollows, softening the distance and lending a pleasant freshness to the air. As he steps from his train the first impression made on him is that of the brilliant colouring, for of all the senses the eye is the most active and the first to note new impressions. Almost at the same instant, however, he becomes aware of the profound stillness—a stillness that seems to afford the ear a positive and even an intense sensation, like the famous darkness that is said to have been "felt." As he begins to walk, and brings his lungs into vigorous play, he becomes fully aware of the qualities of his new air. Just as the London fog afflicted him with its many bad properties, which, not having the analytic power of Coleridge, he was unable to discriminate and name, so now the morning air, retaining something of the mellowness of summer beneath its keen freshness, dimly unfolds to his respiratory sensibilities its many hidden virtues. We will suppose that our fugitive from London fog is so fortunate as to have the companionship of some local friend who is not unnaturally proud of the beauties of his neighbourhood, and glad to reveal the less accessible of them to an appreciative eye. They pass first, perhaps, into a finely-timbered park, where the beeches and oaks have shed their nuts, and made a rich carpeting of their leaves, inviting a few idlers to the pristine occupation of nut-gathering. Hence they strike up the steep side of a chalk hill amid fir trees, making a mirth-provoking slip now and again, for last night's frost has given an unusual slipperiness to the surface. As they ascend, the full sense of autumn takes possession of the Londoner's mind. The song of birds is over, unless, indeed,

> some widow'd songster pours his plaint
> Far, in faint warblings, through the tawny copse.

The rustle of a falling leaf, and the sob of a passing breeze among the trees, feed the autumnal mood of thought with appropriate suggestions. Between the shafts of the fir trees they catch glimpses of a bowery hollow bright with autumn colouring, or of a stream whose waters, swollen and whitened by the rains, rush seaward with riotous gladness. Soon they emerge on an open grassy ridge from which ampler views are obtainable. The full glory of many-tinted autumn now breaks on the eye. The lighter yellows of the lime and oak, or, if it be the last of the autumn, the still more brilliant hues of the elm, and the deeper, warmer tints of the beech, or the rarer maple, combine with the unchanged green of the yew and fir trees in a most intricate, yet ever harmonious, colour scheme. The masses of warm colouring hang over the green slopes of the rounded hills like folds of some rich Oriental vestment. The smaller growths of bramble, gorse, and juniper carry on the same contrasts and harmonies of tint in smaller masses. Here and there a chalk pit or a patch of wild clematis supplies the eye with a bit of neutral colour, by a reference to which the force of the prevailing hues is more vividly felt. In the distance the bounding ridges take on a bluish tint, and conduct the eye gently to the perfect repose of the azure vault above. The pleasure derived from the scene will be greatly enhanced by the remarks of the friend to whom it is a familiar every-day sight; for if, on the one hand, the stranger feels a thrill of delight which only a vivid sense of newness and contrast brings, on the other hand the inhabitant has a subtler enjoyment, which is drawn from many memories and a perfected habit of fine discrimination. To his eye each modulation of tint in beech or elm at once takes its right place in the whole melody of autumn change. He knows, too, the slight variations of colour from season to season due to changing conditions of humidity, &c. And as he talks out of the fulness of his rural lore, his visitor gains a new insight into the mysteries of autumn colouring.

While there are these wider views to be shown to the visitor, there are little bits of special beauty or interest hidden away from the casual rover in secret nooks. Now it is the picturesque ruin of a house belonging to a half-forgotten philosopher of the last century which the present owner of the estate has done good service to an appreciative few in preserving. As the stranger regards the remnant of what must have been a handsome structure pitched on a plateau overlooking a fine sweep of undulating country, he thinks perhaps that he has found the clue to the writer's optimism. A man to whom the lines appear to have fallen in such pleasant places not unnaturally took a complacent view of existence as a whole. And in this peaceful retreat he must have had the leisure which seems necessary for his curious and interesting calculation that human suffering, which is supposed to be approximately the same in all cases, probably amounts to about "a minute of pain once in every twenty-five years." Other relics there are to be visited more venerable than the optimist's house, monuments of nature's patient accumulative industry. Led through what seem to be trackless woods by his trusty guide, our Londoner finds himself in the midst of a clump of stalwart yew trees. Their stout compact trunks are barkless, and their gnarled contorted limbs seem splintering under the influence of centuries of frost. Yet above, the soft green plumage lives and thrives, being just now studded with succulent berries. A no less noble spectacle awaits our Londoner a little further on, where a number of ancient beeches huddle themselves together, like a group of cronies, in order the better to hear one another's hoarse gossip of things of yore. Here, too, the vital forces which underlie growth, contending perhaps with exceptional external conditions, have wrought many a curious irregularity. Only one trunk stands perfectly erect, column-like, among its bent and twisted companions. The forms of the trunks, now divided into a number of parallel shafts like a clustered pillar, now twisted spirally in a strange manner which vividly recalls some of Blake's celestial backgrounds will naturally suggest architectural images in the mind of the Londoner, more familiar with the structure of church than of tree, and so the conversation wanders pleasantly into the subject of the historical or genetic relation between architectural and natural forms. On looking up at the magnificent branches spreading away in wide horizontal sweep till they dip and touch the ground, our imaginary friends may not improbably go back in thought to a still more distant age, when our reputed ancestors needed to shape to themselves no manner of dwelling, but found ample lodgment provided them in the hidden recesses of umbrageous trees.

Meanwhile the autumn afternoon is nearing its close—

> The western sun withdraws the shorten'd day;
> And humid evening, gliding o'er the sky,
> In her chill progress, to the ground condens'd
> The vapours throws.

The gradual subsidence of the splendours of colouring reduces the eye from its state of intense activity to one of comparative repose, leaving room for the resurgence of lower sensations. The fine-edged, exhilarating air, together with the six hours' walking, has given birth to a group of unfamiliar bodily feelings, among which a keen craving for food is the most easily recognizable. The day's rural enjoyment will be complete if our Londoner betakes himself to some inn of the neighbourhood, unless indeed he is fortunate enough to be taken home by his sympathetic cicerone. In either case he will know what it is to sit down to a meal with a kind of appetite which is something more than a dull sense of organic want, having a very definite reference to the keener pleasures of the palate. With a body refreshed and regenerated by its day's immersion in pure air, and a mind no less refreshed by its contact

with the perfect repose and picturesque scenery of the country, he will return to town with more courage for facing the insidious attacks of his hostile fogs. No doubt their complexion will be all the more hideous for this day's glimpse of the varied beauties of unimpeded sunlight; yet the image of them will have a happier effect in lighting up his dismal surroundings with a soft ray of hope. Henceforth his dingy town surroundings will seem but a small part of his real environment. Beyond the fog his imagination sees wider regions of pellucid air and gladdening sunshine. If, as is sometimes said, a good part of the worth of our surroundings lies rather in certain possibilities of enjoyment than in any actual pleasures, we may understand how an occasional flitting beyond the smoke such as we have here imagined may very appreciably mitigate the evils of an autumn imprisonment in town.

GUY'S HOSPITAL.

THE death of the unfortunate man Pateman, who was dismissed last week from Guy's Hospital with a severe, and, as it proved, fatal, fracture of the skull, after being examined by a nurse only and treated for a mere scalp wound, has naturally once more attracted attention to the affairs of that institution. It is of course true enough that neither this case nor even the still more serious one of the nurse who was accused and found guilty of causing the death of a patient by direct misconduct would necessarily have attracted much attention in ordinary times. But these are not ordinary times for Guy's Hospital, and it would be difficult for the most adroit advocate to contend that the two occurrences in question have nothing to do with the recent dispute between the governing body of the Hospital and the medical staff. The delinquent in the former case was indeed an "old sister"—that is to say, not one of the nurses introduced into the Hospital under the present *régime*. But the high-handed manner in which she chose to adopt therapeutic or disciplinary measures on her own responsibility and at her own discretion could not be held to be altogether unconnected with the great dispute of Nurse *v.* Doctor. In the present case the nurse whose fault has resulted in loss of life is a fully representative example of the "new sister." She had, indeed, come from the same hospital—that at Leicester—from which the matron who now rules at Guy's came; and her evidence certainly seems to have disclosed some remarkable shortcomings in the system of organization now working—shortcomings which strengthen the case of the medical staff very materially. Phyllis Phillips declares positively that no kind of authoritative rules or directions for her conduct have been issued to her since she came to Guy's. The nurse whose place she took remained with her a couple of days, so that she had at least an example of practice, but she had no code of rules. She "came as a trained nurse from Leicester, and they supposed she knew." Now this certainly puts a new aspect on the whole controversy. Hitherto the case of the doctors has been that undue prominence was assigned to the nurses; that the new system of rules for the conduct of the latter was not drawn up with the assent of the medical staff, and contained items likely to be injurious to the well-being of the patients; and so forth. But at least the thoroughness of the system was hardly disputed. The idea was that the nurses took too much upon themselves perhaps, but certainly not that they were taken individually on trust, and "supposed to know" their duties. In this case both errors seem to have been combined in a singularly unfortunate manner. Hitherto there has been, outside the Hospital, a good deal of sympathy with the nurses and with the governing body as against the medical staff, partly because of the injudicious tone and conduct of the latter, partly from an old, and not perhaps wholly unfounded, idea, that doctors sometimes consider patients in hospitals rather as interesting and convenient exemplifications of curious scientific truths than as sufferers whom it is their business to relieve. We say that this idea is perhaps not wholly erroneous, though there is no doubt that it is grossly exaggerated. But the two cases which have in the last few months caused such scandal reverse the parts attributed to the actors altogether. Inhumanity and carelessness appear on the side of the nurses, care and attention (rendered useless by the refusal or neglect to give them an opportunity of showing themselves) on the side of the doctors. No doubt the actual conduct of Phyllis Phillips was rather thoughtless and unfortunate than criminal. The house surgeon (very much to his credit), while admitting that the case ought to have been referred to him, declined to say that the dismissal caused the man's death, laid stress on the difficulty of ascertaining the fact of fracture, and made no attempt whatever to get up a case against the opposition element in the Hospital management. But the fact that the nurse steadily maintains that no positive directions of any kind were given her for her conduct towards patients when admitted, and that she was "supposed to know," will have more influence with the public than reams of argument about the relative importance in the hospital hierarchy of the abstract nurse and the abstract doctor. The presence of a medical student may excuse Phyllis Phillips; the absence, if only in one instance, of a precise written order to summon qualified authority in every case is, it cannot but be said, conclusive against the actual management of Guy's.

The clamour which has been raised for a change in the constitution of the governing body seems to us, we must confess, a singularly short-sighted and clumsy attempt to solve the difficulty. In this particular quarter of the nineteenth century there seems to be a considerable number of persons whose only idea of curing is to destroy something. The method is not scientific; we doubt whether it is even effective. That it is well that medical and surgical science should be represented on the governing body there can be little doubt; but that such representation should be in any way preponderant, should be indeed much more than consultative, seems to us by no means desirable. We think that the management of such institutions in England will, on the whole, bear very favourable comparison with that usual in any other country; and the very soul and marrow of the principle of that management is that it should be chiefly, if not wholly, in the hands of laymen lifted by their position, fortunes, and character out of the possibility of being influenced, not merely by corrupt motives, but by any professional crotchets or fads. We are quite certain that the public, and especially that somewhat suspicious and not very enlightened portion of the public which principally derives benefit from hospitals, has infinitely more confidence in such a governing body than in one composed of experts. There is, as we have said, a very strong feeling against the subordination of the charitable to the scientific purpose of hospitals; and hitherto, until these two unlucky cases altered the balance, this feeling has been decidedly on the side of the Governors of Guy's. But it by no means follows, because the influence of the medical staff ought not to be predominant in the legislative body, that their advice in matters of administration should not be attended to with the utmost deference. It seems impossible to contend that in the late alterations of the system of internal management at Guy's this wholesome principle has been duly observed. Recognizing fully, as we do, the importance of the nurse's position, we can only repeat what we asserted in dealing with this question months ago, that that position must always be subordinate to the doctor's. The nurse should be the doctor's hands, and the hands cannot be too delicately trained and too thoroughly adapted to their work, but they must not aspire to be heads as well as hands. Only the idlest prejudice—and it is unfortunate that a great deal of very idle and very irrelevant prejudice has been imported into this question—can deny that the average nurse of the stamp of the "new sisters" of Guy's is immensely superior to her forerunners. Better social position, more entire devotion to work, superior technical instruction, improved morality, higher motives of action may, as a rule, safely be assigned to her. But at the same time it is impossible not to see that these improvements carry with them a danger—the danger that the nurse will magnify her office and take too much upon herself. We do not think that in cool blood any one can be found to deny that this danger has been proved to be no imaginary danger, both on the great scale and on the small, at Guy's Hospital during the present year. That any individual feeling of antagonism between nurses and doctors exists we may hope is not the case. But it is only necessary to turn over the pages of what may almost be called the sacred book of the new school of nursing, the *Life of Sister Dora*, to show that a certain masterfulness—shall we say mistressfulness?—is apt to be engendered in the more perfect examples of the type. There are times when they are obliged to think and act for themselves; there are times when chance or devoted care justifies their own apparently wilful and arbitrary opinion against the judgment of science. These things puff up even the best, and the ordinary run of nurses are pretty certain to imitate the faults, without possessing the virtues, of their exemplars. A brilliant wilful nurse may save a case or two where the plodding drudge who simply carries out the doctor's orders would lose it. But a wilful nurse who is not brilliant—which, on the whole, is likely to be the case—is quite certain to lose a dozen where the plodding drudge would save them.

These very obvious truths cannot escape the attention of the Governors of Guy's, and ought not to escape them, despite the provoking and almost inexcusable manner in which the war has been waged against their servants by the scientific staff of the Hospital and its partisans. Not even the exceeding indiscretion of the chief literary advocate of the other side could excuse even the least discreditable of the proceedings to which we refer. But, in truth, the public are not interested in the skill of fence, or the good taste, or even the intrinsic deserts, of either side in the fray. What is wanted is that a great public institution which has in times past done an immensity of good, and which ought rather to increase than to diminish in usefulness, shall be set in the best working order and kept in that order. Individual merits and interests, susceptibilities and demands, sink into insignificance beside this. Now the warmest advocate of the doctors cannot pretend that the spectacle of their petulance and readiness to take umbrage is calculated to increase public confidence in them, and the warmest advocate of the nurses cannot pretend that the cases of Louisa Ingle and Phyllis Phillips are models of the manner in which patients ought to be treated at a hospital. "A plague on both your houses" is the natural exclamation of all who do not wish themselves, their friends, their dependents, or indeed any human being, to be bundled into a bath and left there, as a disciplinary measure, or to be treated for an ordinary "cracked crown" when the crown is but too seriously and literally cracked. We are disposed to think that hitherto the Governors have in no respect failed in their duty, and have made the best of a very awkward business; but it must now be a serious consideration with them whether decided measures should not be taken to

secure what is—it must be again and again repeated—the real object of the Hospital, that is to say, the proper treatment of the patients. That nurses of the same class as those at Guy's can work elsewhere in due subordination to the medical staff is a simple fact; and perhaps this fact suggests a way out of the difficulty.

WINTER OPERA.

MR. ARMIT has not thus far been specially fortunate in his season of Autumn cheap opera at Her Majesty's Theatre. The opening night of his management was marked by some considerable disappointments, and the succeeding nights have hardly availed to remove the first impression. Superstitious people might be inclined to think that the profanation of the stage once sacred to the greatest names of opera and ballet by a troop of American "Minstrels" with corked faces had left behind it an evil influence, much as in Lord Lytton's story of "The Haunted and the Haunters" the presence of one man in the doomed house made itself felt and feared through a long succession of years. Up to this point, as far as regards the principal performers in Mr. Armit's company, his management might be not unfairly described as a reduction to the absurd of the "star" system. He has secured one artist of the very highest power and skill—Mme. Trebelli—and she has been surrounded with a crowd of more or less unknown singers, many of whom it would be flattery to call nonentities. Mlle. Bauermeister, it is true, has been at hand to fill on the first night, with the marked readiness which distinguishes her, the place of the missing Margherita; and she has since done in various operas such excellent service as she always does; while at least one new singer of merit has appeared. Again, if anything could add to the sense of Mme. Trebelli's excellence as a singer and an actress, it would be the proved fact that it is worth while to sit through an unusual amount of bad acting and singing in an opera because Mme. Trebelli appears in it. In the same way, the shortcomings of other performers have accentuated the merit of Mlle. Bauermeister, who is perhaps to the second rank of operatic singers what Mme. Trebelli is to the first. But the presence among the ladies engaged of one singer who stands at the head of the first and of another who stands at the head of the second rank will hardly support a whole season of what are intended to be in the best sense of the word popular operas. Nor, in spite of the merits of Signor Vizzani and Runcio, will their appearance as tenors altogether make up for the inefficient, and frequently worse than inefficient, performances of the baritones and basses. It is only fair to add to these general remarks that the stage management has been good, that in one opera the chorus has distinguished itself, and that Signor Li Calsi's conducting has been marked by skill and strength.

Since the opening night the changes have been rung upon a small number of well-known operas. The first appearance of Mme. Trebelli—who has been the mainstay of all the performances—took place in *La Favorita*, in which she played for the first time in London the part of the heroine. Her performance was, as might have been expected, charged with fine perception and passion; and her singing, throughout admirable, was especially beautiful in the "O, mio Fernando." Signor Cantoni appeared as Fernando. His singing was of an untrained and mediocre kind, and the quality of his acting may be judged from the fact that, in the great scene of the third act, he entirely missed any dramatic force, and preserved throughout a smooth, irritating smile. Signor Ordinas got through Baldassare tolerably well, and Signor Quintilli-Leoni sang and acted Alfonso intolerably ill. It would be interesting to know who taught Signor Quintilli-Leoni to sing, and why. Mlle. Bauermeister's Inez was, apart from Mme. Trebelli's performance, the one redeeming point in an exhibition which, as regards the principal singers, was wretched enough. The chorus were not often to blame, and in the third act sang well.

Mme. Trebelli subsequently appeared in *Carmen*, in which the beauties of her performance seem to have gained by practice. Without one touch of the vulgarity which has been sometimes imported into the part, she indicates with rare skill the heartless devilry of the girl who cannot long be pleased with the same lover, and yet so saves it from offence that the sympathies of the audience cannot but be more than half with Carmen. The gaiety, the grace, the wild spontaneity which belong to Mme. Trebelli's interpretation of this part have never been more marked than now, and her admirable byplay seems to have gained in ease and precision. Signor Runcio's José has also improved; his passion is more controlled, and therefore more effective; his singing is smoother, and his acting in the last fatal scene has real force. Mr. George Fox appeared as the Toreador. He sang the well-known song badly, and pronounced his words badly. His acting was throughout ineffective. Mlle. Olga de Morini appeared as Michaela. She seemed to suffer from nervousness, but she also undoubtedly suffered from insufficient learning. So long as the public will tolerate the appearance of untrained singers, so long, it is to be feared, will untrained singers continue to appear, and of course the mischief is one that acquires strength by its own motion. There is no doubt something to be said in favour of the existence of the feeling which prompted some of the audience to quash by applause the signs of disapprobation which Mlle. de Morini's singing began at one time to provoke; but the constant expression of such a feeling will not do good to the art of the operatic stage. Mlle. Bauermeister appeared, with her accustomed excellence, as Mercedes. In this opera the chorus was unusually good.

The *début* of Mlle. Rosina Isidor in *Lucia di Lammermoor* on Saturday might be described as a success, if it were judged only by the applause which attended her during the performance. One of that class of soprani which are called "light," she possesses many gifts which should, with further experience of the stage, raise her in the ranks of her fellow-artists; but, at the same time, her faults were not hidden under a bushel. Her phrasing, for instance, of the celebrated air, "Regnera nel silenzio," in the first act, was, to say the least, eccentric; whilst her singing of "Spargi d'amaro pianto" in the third act was very far from what might be desired. As, however, a great part of the audience continued to applaud, we suppose that they take and will take little heed of such errors as we complain of. Mlle. Isidor may, with further study, as we have said, attain a fair position as a singer, for she is able at least to sing in tune, an accomplishment which appears to be thought little of nowadays. Her acting in the first and second acts was praiseworthy; but she seemed both as to acting and singing to have exhausted herself by the time she arrived at the mad scene. It may perhaps be said that it is impossible to act the part of a madwoman and at the same time sing the exceedingly difficult vocal exercises which Donizetti most inartistically, to our mind, has chosen to set down for the unfortunate Lucia; but Mlle. Isidor, by way of out-Heroding Herod, inserted a more elaborate cadenza—if that be possible—than even Donizetti has conceived, and it is only fair to say that she sang it with great credit. Signor Vizzani's Edgardo was an intelligent rendering of the part, whilst Signor Quintilli-Leoni's Enrico was perhaps the most grotesque thing of its kind that the audience at Her Majesty's have ever been treated to. A portly Henry Aston, with a voice which the constant tremolo renders annoying to listen to, and with an intonation far from true, is hardly the character the composer intended to portray. Signor Ghilberti as Raimondo was unobjectionable, whilst the less we say about Signor Conti's Arturo the better. Mlle. Barnadelli played Alisa.

On Tuesday Bellini's opera of *Norma* was produced for the *début* of Mlle. Lorenzini-Gianoli, who comes to us with a reputation from Italy. This singer suffers from a fault, easily rectified indeed, but also growing too common, which makes it difficult to imagine how she could have succeeded, as we are told she has done, in drawing large audiences in Italy. We thought at first that the vibrato under which she labours was due to nervousness; but we soon found out our mistake. That she sang the music correctly, and acted her part with considerable vigour, we must concede; but that hearing her performance gave us any pleasure we cannot say. Mlle. Bauermeister sang the part of Adalgisa with great success, her sostenuto contrasting most agreeably with Mlle. Gianoli's tremolo; and Signor Vizzani's Pollione was as good as that exceedingly unpleasant character could be made by polished singing and careful acting. Oroveso fell to Signor Antonucci, who sustained the part with much dignity and sang the music creditably.

Faust was given for the second time on Wednesday last, when Mlle. Elisa Widmar, who had been wanting on the first night, appeared as Margherita. Her performance was fresh and unconventional; she sang well, on the whole, in spite of an evident nervousness, which sometimes led her astray, and her acting in the cathedral scene displayed both poetry and originality. Signor Runcio sang Faust creditably, and with much more feeling than is generally found in singers who undertake the part. Signor Ordinas appeared as Mephistopheles. His performance has not improved since he undertook the same part some time ago at Covent Garden. He has, as an actor, good intentions, and at some moments he carries them into effect with considerable success. But his tumbling down in the scene where he shrinks before the cross-handles of the swords, and his appearance under a red light at Margherita's back when she is trying the flower-test in the garden, show that his conception of the part is at best faulty. He sang the "Dio dell' Or" with some vigour, but with an offensively "yapping" utterance in the fifth and eighth bars. In the rest of the part he sang too often flat, and once, at least, sharp, and he gave the serenade, in which his intonation was more than once at fault, without any conception of its mock tenderness, at the full power of his voice throughout, and without any attempt to make the laugh, the real horror of which lies in its music, anything but a kind of savage yell. Mr. George Fox sang, or was supposed to sing, Valentino. It is perhaps hardly worth while to criticize the performance of a singer who has not learnt the rudiments of phrasing, and whose command of his voice is uncertain. To Mme. Trebelli's Siebel it seems impossible to apply any new term of praise. On the occasion of which we write Siebel became the principal part in the opera. It is to be hoped that Mr. Armit's season will improve as it goes on. He has secured, apart from Mme. Trebelli, those elements of success for popular opera to which we referred at the beginning of this article—good stage management, a good conductor, and a chorus which is capable of doing well. He has also found a dancer of exceptional merit in Mlle. Palladino. But it would take more than this to render tolerable the extraordinary shortcomings upon which it has been unpleasant to dwell.

THE CAMBRIDGESHIRE.

THE Cesarewitch had been so exceptionally interesting a race that the Cambridgeshire appeared dull in comparison with it. On the publication of the two great handicaps, the Cambridgeshire looked on paper quite as attractive as its companion. Isonomy headed the list, as in the Cesarewitch; then came Peter, Robbie Burns, Dresden China, and Roehampton, while at the head of the three-year-olds was Robert the Devil. Lower in the list were to be found the winners of the Two Thousand and the One Thousand, the winner of last year's Cambridgeshire, and the winners of the Criterion, the Goodwood Stakes, the Chester Cup, and many other races. Considering that, after scarcely better promise, the Cesarewitch turned out to be one of the most interesting handicaps ever known, it was disappointing to find the Cambridgeshire a comparatively tame affair. From the very commencement of betting on the race it was evident that, in public opinion, the heavily-weighted horses, with one or two exceptions, had decidedly the worst of the bargain. The forfeit list itself contained the names of many good horses, and but few of the best left in the race were noticed in the betting quotations. At one time there seemed to be some hope that Prestonpans, the winner of last year's Criterion, and one of the most heavily-weighted three-year-olds left in the handicap, might become the first favourite; but, although he was one of the earliest horses to be backed, there were plenty of bookmakers ready to lay heavily against him.

When the speculation on the race had fairly begun, the most heavily-weighted horse that was backed for any large sum of money was Exeter, a four-year-old, handicapped at 9 st. 1 lb. There are few, if any, finer animals in training than this horse. He looks capable of carrying a heavy man to hounds, and yet he is anything but coarse. In the Hardwicke Stakes at Ascot he had beaten Rayon d'Or by a head. This was not altogether a very creditable victory, as he was receiving 10 lbs. from the Frenchman, but nevertheless he had run very game. At Doncaster he had beaten Roehampton by a neck, when receiving 5 lbs. He was in the same stable as Robert the Devil, and was said to be much inferior to that horse, whom he had led in his gallops for the St. Leger. In the Cesarewitch he had not distinguished himself, but it was possible that the distance had been too great for him. A horse of his power seemed well suited to the Cambridgeshire hill, and it was hoped that he might emulate the performance of his stable companion, Robert the Devil, by winning one of the two great handicaps under a weight of unprecedented proportions. Another heavily-weighted horse was American Spendthrift, a four-year-old that had never before run in public in England. The form he had shown in America had been excellent, but there were rumours that he was a roarer. Archer was engaged to ride him, so there was no danger of his not being shown the way home on the strange course. 8 st. 12 lbs. was a tremendous weight for the American to carry, and he had only 3 lbs. advantage over Exeter. Cipolata was handicapped at 8 st., but she carried 8 st. 2 lbs. We have so often spoken of the performances of this mare that we need not describe them again now. With regard to her recent defeat in the Newmarket Oaks there were two excuses to be made—one, that her opponent may have beaten her through the fine riding of his jockey, the other that she might not have recovered from her severe race in the Cesarewitch. Indeed, when she ran for the Newmarket Oaks she looked very much worn, and she had every appearance of having been exhausted by her race of the previous Tuesday. She is a fine lengthy mare, with beautiful racing-like shape; but she is not overburdened with muscle, and she was suffering from a cracked heel. Another favourite was the three-year-old Retreat, who rivalled Exeter in good looks. He had run very well in the Cesarewitch up to the point at which Robert the Devil began his rush. He had now 7 st. 4 lbs. to carry, which scarcely seemed an unfair burden for him. Ulster was also a good-looking competitor. He had been eighth in the Cesarewitch, and he was now to carry the light weight of 6 st. 12 lbs. A strong and muscular filly was Lucetta, though she was neither tall nor lengthy, and, as a four-year-old with only 7 st. 1 lb. to carry, she seemed favourably handicapped. She had capital legs and feet, and was reported to be in excellent training, but she had hitherto run better as a three-year-old than as a four-year-old. Leoville's best performance this year had been to run second to Master Kildare in the City and Suburban Handicap, in which race he was only beaten by a head. Last year he had started equal favourite with Lartington for the Cambridgeshire. He was now to carry 7 st. 10 lbs. He is by D'Estournel, whose stock are not, as a rule, very trustworthy runners, and there were rumours that he had lately run badly in a trial. There seemed a great deal to be said for the chances of Fernandez. This three-year-old is an own brother to Isonomy. He had won the Craven Stakes at Newmarket in the Spring; and, after running nowhere in the Two Thousand Guineas, he had come out at Ascot and run Bend Or to a head in the St. James's Palace Stakes. It was thought at the time by most racing men that this form was incorrect, and that Bend Or would have won easily if he had not been eased in his work. The 8 st. 1 lb. that he was now to carry was a formidable weight; but, if it was true that he was within 3 lbs. or 4 lbs. of Bend Or, he did not seem ill-treated when handicapped within 11 lbs. of Robert the Devil. Much interest was taken in the chances of Castillon, a three-year-old French colt which had never before run in England. He had had extraordinary successes in his own country, having won something like nine races out of eleven during the season. In May at Chantilly Le Destrier had beaten him at even weights; but in August, when he was giving Le Destrier more than a stone, he had run within three-quarters of a length of him. In the Cambridgeshire Castillon was put down for 7 st. 7 lbs., while Le Destrier was put at 8 st. 5 lbs. The last-named horse was struck out some days before the race. Adventure had not been out before this year, but last season she had been a bad third to Wheel of Fortune for the Oaks. Her three-year-old career had been a very unsuccessful one, as she only won one out of eleven races, and that had been but an unimportant affair. At four years old, however, she could scarcely have been let into the handicap at a lower weight than 6 st. 11 lbs. Her stable companion, the three-year-old Evasion, had 6 st. 12 lbs. allotted to her, which was, at weight for age, something like 9 lbs. heavier weight than that given to Adventure. Evasion had been an uncertain and jadish runner. She had won a couple of races last year, but most of her form this season had been very bad. She had been a bad third to Elizabeth and Versigny in the One Thousand, fifth in the Oaks, and nowhere in the Coronation Stakes at Ascot. Then she had apparently taken a turn for the better, for at Goodwood she had run Muriel to a head. Now Muriel, it will be remembered, had beaten Cipolata by exactly that distance in the Newmarket Oaks; therefore, if that running were correct, Cipolata and Evasion might be equal, and yet Evasion was handicapped on 16 lbs. better terms for the Cambridgeshire than Cipolata. At Doncaster again, Evasion had run within a neck of Experiment in the Park Hill Stakes, beating Jenny Howlett, the winner of the Oaks, as well as Muriel herself. All this seemed very contradictory and unsatisfactory running, and the only inference which could be drawn from it was that Evasion must have been an uncertain performer. The aforesaid Experiment was another candidate for the Cambridgeshire, but she was to give Evasion 15 lbs., and on her Doncaster running this seemed to leave her little chance of beating the last-named mare. She had won six races out of seven this season, and she seemed on her public form to be one of the best and most honest fillies of her year. She carried 3 lbs. less than Cipolata, so she had every opportunity of showing what she was worth. At the last moment Fernandez was a strong first favourite at about 4 to 1.

The Cambridgeshire day was terribly wet; indeed it was much such a day as that on which the St. Leger was run. In addition to the heavy rain there was a mist, consequently it was very difficult to see the races; and the weather was almost at its worst when the Cambridgeshire was run. Thirty-one horses were saddled for the race, which was exactly the number that ran for the Cambridgeshire last year. The best-looking of the party were Exeter, Fernandez, and Retreat. At the post Fernandez and Toastmaster were rather restive, and there was a slight delay. When the horses got off King Priam made the running. This horse was a lightly-weighted three-year-old, that had won the Bushes Handicap in the spring. He ran well as far as the Red Post, where he was beaten. Pelleas, another three-year-old, carrying a still lighter weight, then took up the running, closely followed by Lucetta, Fernandez, and Cipolata. The pace soon told on Pelleas, and he gave up the lead. Lucetta then went to the front, followed by Fernandez and Cipolata. The two latter were coming up with so much strength that Lucetta's jockey began to use his whip, when his filly swerved, apparently right across Fernandez and Cipolata. Whether he was absolutely hindered by Lucetta's swerve or not, Fordham, who was riding Fernandez, seemed to take a pull at his horse, as if fearing an accident; and it is probable that he lost some ground. It was a near thing; and, although Lucetta won, it was only by half a length. Cipolata was a couple of lengths behind Fernandez. An objection was immediately lodged against Lucetta, on the ground of a cross; but, after a long consultation, the Stewards overruled it, and Lucetta's victory was confirmed. Into the merits of the case we are not disposed to enter, but thus much we may say. It was raining hard when the race was run, and the mist made it very difficult for spectators to see clearly what was going on; therefore the only satisfactory method of coming to a conclusion was to hear the evidence of the jockeys who had ridden in the race. All possible evidence connected with the affair was patiently heard by the Stewards, and they had better opportunities of judging in the matter than anybody else. On the other hand, it does not follow that, because a cross could not be proved, Fernandez may not have been to some extent impeded by Lucetta's swerve. Then, again, even if Lucetta did not get in the way of Fernandez, the very fact of Fordham's protest makes it likely that he took a pull at his horse to avoid what appeared to him to be a danger, although that danger may possibly have been imaginary. We dwell on these two points because it seems to us that the slightest check on Fernandez at such a critical part of the race may have made a difference of half a length, and we are desirous that this horse should have full credit given him for what was an excellent performance, considering his heavy weight and the state of the ground. He is a remarkably fine horse, and has improved much in appearance during the last few months. He is not unlike his brother Isonomy, but he has more size. Unfortunately, he has not the best of tempers. That he is nearly as good as Robert the Devil we do not believe; but, assuming that his running in the Two Thousand was incorrect, which, judging from his subsequent performances, we consider we have every reason to think, his public form after the Cambridgeshire seemed to make him out to be about the third best three-year-old of his year. Lucetta had been trained by

Blanton, the trainer and part owner of Robert the Devil. Her victory must be considered, at best, rather a lucky one. Yet it would be hard to grudge the race to Prince Soltykoff. Exeter never took a prominent part in the race, and he was one of the last horses to pass the winning post. Cipolata ran well, but she rivals The Abbot in the number of times that she has been second or third for great races, and she must be looked upon as an unlucky mare. Although not as interesting as the Cesarewitch, the Cambridgeshire was a good race and a good handicap.

REVIEWS.

RECENT TRAVELS IN JAPAN.*

(First Notice.)

THE appearance of these two works at the same time is most opportune. Each supplements the other, and together they form an accurate picture of the present anomalous condition of Japan. Like the celebrated shield of chivalry, Japan and the Japanese wear two faces. To the admiring gaze of Sir Edward Reed there appeared nothing but burnished gold, while it was left to Miss Bird to discover that there was a reverse side of quite another metal and brilliancy. The reason of this is not far to seek. The reforms which have been announced with such flourishes of trumpets have only favourably affected one portion of the Empire. The remaining part is left in the same, or even a worse, condition than it was before the rage for everything European took possession of Japanese statesmen. In the northern part of the same island in which Sir Edward Reed inspected colleges, hospitals, and schools established on the European model, and over which he travelled in luxurious railway carriages, Miss Bird found that the

> people never know anything of what we regard as comfort, and in the long winter, when the wretched bridle-tracks are blocked by snow and the freezing wind blows strong, and the families huddle round the smoky fire by the doleful glimmer of the *Andon* (oil lamp), without work, books, or play, to shiver through the long evening in chilly dreariness, and herd together for warmth at night like animals, their condition must be as miserable as anything short of grinding poverty can make it. . . . There are no schools in these mountain villages, and medical advice, except of the old Chinese school, is hard to get. The necessaries of life are growing dearer, the Government machine at Tôkiô wants much costly greasing, the tax-gatherer follows the harvest, and the people know the cost of progress, with few of its blessings.

Tôkiô forms the boundary which divides Sir Edward Reed's Japan from that portion of it of which Miss Bird for the most part writes. They both started from the same spot; Sir Edward went southward, while Miss Bird went northward. They both describe what they saw; but, if one had been writing about Northern Italy and the other about Siberia, the difference could hardly have been greater.

Sir Edward Reed tells us in his preface that he went out to Japan at the invitation of "his Excellency Admiral Kawamura, the Minister of Marine, and some of his colleagues." This fact possibly explains to some extent the roseate hue which, in the eyes of Sir Edward, was shed upon everything connected with the country, past, present, and future. Educated Japanese, such as Admiral Kawamura and his colleagues, possess in an eminent degree the art of making themselves agreeable; the part of the country through which they carried their guest was rich, prosperous, and beautiful; the sights they showed him were varied and interesting; nothing that was unsightly was allowed to obtrude itself, and every inconvenience of travel was reduced to a minimum. What wonder, then, that Sir Edward came away impressed with the beauty of the country, the bright geniality of the people, and the wisdom of the statesmen who are leading their countrymen along so smooth a path of progress! As soon as the ship in which he was passenger dropped anchor off Yokohama, an Admiralty steam-launch came alongside to convey him to the Port Admiral's landing-place, where he was met by his hosts. A short railway journey, and a drive from the station in an Imperial carriage, brought him to Admiral Kawamura's house in Tôkiô, where he found himself "delightfully located in the midst of a purely Japanese household, but with an adjoining building of European style newly erected for the use of foreign visitors, and furnished with the choicest art-furnishings of Japan." Tôkiô, "the eastern capital," or, as it used to be called, Yedo, is, in its present hybrid condition, not a prepossessing looking city. It is built on a dead level; the streets, which are wide, have a deserted appearance, and the mixture of the low, dull, grey native buildings, with the gaudy imitations of European architecture which have lately sprung up, produce neither harmony to the eye nor an agreeable contrast:—

> *Yedo* [writes Miss Bird] is chiefly represented by the grandeur of the castle walls, banks, and moats, the *Yashikis*, many of which are showing signs of decay, and the crowded streets of warehouses and wholesale produce merchants in the neighbourhood of the Nihon Bashi, the bridge from which all the distances in Japan are said to be measured. *Tôkiô* and the new *régime* are architecturally represented by the ministerial villas of stone-faced brick, with red brick garden walls, the engineering college, really solid and handsome, and a number of barracks, departments, police stations, colleges, and schools in a debased Europeanized or Americanized style, built of wood painted white, with a superabundance of oblong glass windows, and usually without verandahs, looking like inferior warehouses, or taverns in the outskirts of San Francisco, as vulgar and as dismally ugly as they can be, and more like confectionery than building.

To Sir Edward Reed the outside appearance of the city was of less moment than that of the interiors of the houses and shops. The hospitality of his numerous native entertainers, and the excellence of their cuisine, obliterated from his recollection the *bizarre* look of the outer walls of their dwellings; and, while feasting his eyes on the individual contents of the curiosity shops, he forgot the generally mean and tawdry aspect of the city. After a month, which seemed all too short, spent in sightseeing and the society of his friends, it was arranged by his host that he should make a trip through the inland sea to Nagasaki, in a steamship belonging to the Lighthouse Department of the Government. This arrangement combined the double advantage of enabling him to enjoy the lovely lake-like scenery of the inland sea, with its numberless islands, and the boundless varieties of form and colour which adorn its hilly shores, and at the same time to inspect the lighthouses which mark its perils. Beautiful as this portion of Japan is, the interior arrangements of the lighthouses bore evidence to the existence of a danger which constantly threatens it with destruction. A land where it is necessary so to balance the lighting apparatus as to neutralize the effects of frequent earthquakes must be acknowledged to have its drawbacks; and water in which a man-of-war, such as the Russian frigate *Diana*, could, by the effect of tidal-waves following an earthquake, be "spun round forty-three times in thirty minutes, and be thrown high and dry, a useless wreck, at the end of the revolutionary period," has evidently dangerous potentialities.

Unfortunately Sir Edward Reed's attention was called to other things besides the scenery as he steamed along, and a halt at Shimonoséki was sufficient to recall to his recollection the political events which occurred there seventeen years ago. No doubt the circumstances and surroundings were such as to induce him to lend a kindly ear to the gloss put upon the international dispute by his hosts. But Sir Edward ought to remember that his words carry weight, and that it behoves him, before passing judgment on a political question, to examine well the evidence on both sides:—

> These are the waters [he writes] into which steamed, in 1863, the squadron of Christian England (composed of nine war-ships, carrying a hundred guns, and leagued with three French, four Dutch, and one American ship, carrying together more than another hundred guns), to blaze away at the lines and batteries of the subjects of the Prince of Nagato. . . . The first crime to be punished was the warning off from forbidden waters of the American steamer *Pembroke* by a blank discharge, and the attacking of her by two local men-of-war on the following day because she refused to move away. . . . An American writer, whom I often quote in this work, says:—"As a matter of international law the Japanese had a perfect right to close the Straits of Shimonoséki." . . . However, America, like ourselves, recognizing some other principles as much higher and more commanding than "right" and "justice," her envoy sent down the *Wyoming* to take retribution. . . . At about the same time some French and Dutch ships were also warned off by blank fire, and therefore some French and Dutch men-of-war went and blazed away at the Shimonoséki batteries with shell guns. . . . But this was an affair of a sort such as England could not of course be kept out of, and . . . in went the English ships . . . and, with Americans, French, and Dutchmen, bombarded the batteries, landed men to silence them, and removed the guns. In the next month the representatives of the same four Powers decided that it would be a good thing to add to their bombardment a demand for *three million dollars* as indemnities. . . . It is the present Government of the Mikado, struggling bravely along the path of civilization and progress which England, France, and America have pressed them to pursue, that has to provide the money, and that, too, at a time when its chief difficulty in pursuing the new course has been a financial one.

If Sir Edward Reed had held a brief for the Japanese Government he could not have stated the case with more advocate-like partiality. By the treaty of 1858 Osaka was to be opened to trade on the 1st of January, 1862, and Hiogo on the 1st of January, 1863. Both these places are approached by the inland sea, to which the Straits of Shimonoséki form the entrance from the west. Neither of these engagements was kept by the Japanese Government, and it was only after the first had been broken that the foreign Governments agreed to forego their rights in these respects, on condition that the Japanese faithfully fulfilled the clauses of the treaties relating to the ports of Nagasaki, Hakodaté, and Kanegawa. The direct route from Nagasaki to both these places being through the Straits of Shimonoséki, it followed that to close them would be a violation of the free-trading rights secured to these three ports by the treaties. But the head and front of the offence committed by the Japanese was that the attack on the *Pembroke* was the first act of an intended war against all foreigners. Two days before the occurrence the foreign Ambassadors received a circular letter from the Minister for Foreign Affairs, in which he stated that "the orders of the Tycoon were to the effect that the ports were to be closed and the foreigners driven out, because the people of the country do not desire intercourse with foreign countries." To leave unchecked the first move was to give up the game, and how critical was the situation is proved by the subsequent confession of the local Daimio that he had acted in obedience to the orders of the Mikado and Tycoon. The attack was unprovoked and treacherous, and, however much we may sympathize with the present Government in its brave struggles along "the path of civilization and progress," to return the indemnity, as suggested by Sir Edward Reed, is required neither by justice nor expediency. The Japanese Government should learn that brave

* *Japan; its History, Traditions, and Religions: with the Narrative of a Visit in 1879.* By Sir Edward J. Reed, K.C.B., M.P. 2 vols. London: John Murray. 1880.
Unbeaten Tracks in Japan: an Account of Travels in the Interior, including Visits to the Aborigines of Yezo and the Shrines of Nikkô and Isé. By Isabella L. Bird. 2 vols. London: John Murray. 1880.

struggles are often required to wipe out past misdeeds, as well as to march along "the path of civilization and progress." The Shimonoséki outrage is by no means the only international question of which our author takes an entirely Japanese view, and if any member of Parliament, after reading the work before us, should intend to ask questions in the House of Commons about the several political subjects discussed by Sir Edward Reed, we should recommend him to study the Blue-Books of the period before doing so. If this advice be taken, we undertake to say that the questions will never be asked.

If the recollection of the events which took place at Shimonoséki in 1863 followed Sir Edward to Osaka, the contrast between the scene there enacted and the hospitable welcome he received from the Chamber of Commerce at the latter place must have struck him with amazement. After the manner of Chambers of Commerce the Osaka merchants invited Sir Edward to a dinner at which every native luxury calculated to please the eye and palate was displayed. The dinner was served by girls who knelt as they presented an innumerable succession of "soups, meats, fish, game, and all sorts of vegetables daintily prepared," while dancing girls arrayed in bright-coloured crapes and silks diversified their performances by seating themselves among the diners to "assist them to anything they may want and make themselves generally useful." The paternal Government has lately taken these "pretty creations of imperial Osaka" and elsewhere under its protection, and has opened a school for them at Kioto, where they are "taught the domestic arts which are necessary to wives and mothers." This educational net, which is thrown with so wide a cast, is one of the most surprising results of recent reforms in Japan. According to Miss Bird, 1,594,792 boys, and 568,220 girls, between the ages of six and fourteen, attended the Government schools during the year 1877, besides the students of both sexes who received instruction in the numerous colleges scattered throughout the country. In some parts the rage for education is in advance of the desire for the commonest cleanliness, and, in any other country but Japan, the incongruity of finding a congress of schoolmasters discussing educational matters in so "mean, filthy, damp, and decaying a little town" as Bangé, in Northern Japan, would have struck Miss Bird and every one else with astonishment.

The sacred city of Nara, celebrated for its colossal bronze figure of Buddha and consecrated deer, the Shinto shrines of Isé, the Imperial city of Kioto, where for countless generations the Mikados lived in hallowed seclusion, were all visited by the two travellers. Such scenes admit of no difference of opinion. Nature and art have scattered broadcast their bounties on this part of Japan, and the people, as though influenced by their surroundings, have a grace, a kindliness, and an ease about them which add charms to that which is already delightful.

If Sir Edward Reed escaped some of the inconveniences of travel with which, even in this part of Japan, Miss Bird had to contend, she appears to have derived a keener pleasure than he did from the extreme beauty of the scenery, owing probably to the contrast it afforded with her previous experiences in Northern Japan and the wilds of Yezo, whither we intend to follow her.

CLERICAL REMINISCENCES.*

A PLEASANT little volume of reminiscences in the Irish Church was written a few years since in the leisure of an English country parsonage, and was reviewed at the time in our columns, the name of the author, Dr. Brooke, appearing on the title-page. A companion volume, no less pleasant and in no larger compass, issuing from another country parsonage, presents a parallel series of "Clerical Reminiscences" in the English Church, during the same period, but conceals the name of its author. In making this last statement we have been careful to weigh our words in the balance of literal truth, and we have not asserted that "Senex" has concealed his own name. He has "endeavoured carefully to avoid all occasions of offence"—and with entire success—"and to give no clue to the little mystery involved"; the "little mystery" being his own personality—a point upon which there is, undoubtedly, "little mystery," although we do not propose to gratify the curiosity of lazy readers. "Senex," with the true instincts of a Cambridge man, has wrapped up his secret in the folds of a long equation, or rather of a series of equations; and if "the first Honorary Canon of Canterbury," who on the 8th of November, 1863, "received the Pass, or master key," has forgotten for the moment that the key might become the means of revealing other arcana than those of the Cathedral, he has at least contrived his problem so as to make it generally look difficult. Possibly the "little mystery" was designed as an ingenious trap for sceptical and perfunctory critics. Every reviewer, and most experienced readers of anonymous autobiographical reminiscences, especially of those bearing an ecclesiastical colour, will open the volume in a suspicious temper. The "confidence trick" has been tried too often upon this line, and with too much of occasional success, to allow such a book to pass as genuine without strict examination, and we ourselves began our reading in a distinctly non-believing mental attitude. We watched keenly for the anachronisms or topographical blunders of the fiction-writer; but, except that it is certainly more than "forty years" since the Queen was thirteen years old, and as clearly not customary to describe Mecklenburgh Square as "one of the West-End squares," we watched without success. We are not sure that "Senex" has not in one place written Senior Wrangler for Senior Classic; but the "mystery" had become too clear to make it worth while to follow up the point. No apology can be required if we write of some places without any circumlocution, or if we supply a name here and there which is not given in the book itself.

"Senex" had filled two curacies before he was presented at Court, where (in 1832) he "saw the Princess Victoria, then thirteen years of age, led by her mother, and smiling and bowing even then like a young queen," upon his appointment as chaplain to a newly-consecrated Indian bishop—Wilson of Calcutta. The first of these curacies, in 1828, was in a large manufacturing parish in Staffordshire; the second, that of St. Sepulchre, "half in and half out of the City," which had been accepted in 1830 by one of the Senior Fellows of St. John's College, Oxford, "on the condition that his friends would find him a curate." The general impression "of dinners such as" the Senior Fellow—Mr. Natt must have been a very Senior Fellow, since his name stands high on the list seven years earlier—gave his curate "remains after forty," or rather after fifty, "years." Something more than "a general impression" would appear, by the details of the *menu*, to have "remained" in the curate's mind, who till then "scarcely knew what a good dinner was, or how it should be eaten." "Silence was a prime requisite; to talk whilst eating was rank heresy." A couple of slight background sketches—one of gross feeding at a City feast, the other of clerical Jack Horners at a Cambridge High Table—serve to bring out this picture of Oxford artistic dining; and probably the discovery of the uses of "brown sherry nearly as old as myself" as an eirenikon five-and-twenty years later in the experience of a Rural Dean was only a result of the early teaching of Mecklenburgh Square. But the curate of four years' standing whom Bishop Wilson had selected as his chaplain must have been known as more than a keen observer and lively diner-out; and the opening pages of his *Reminiscences* present at once, from the Cambridge life of the time, an illustration of the religious fervour then existing among younger men, and an instance of the prevalent neglect of ecclesiastical order by their superiors. What would be thought now of "five or six close friends who had just taken the degree of B.A.," borrowing the key of the University church in order that one of their number might preach a specimen sermon from the University pulpit, "around" which they "all met after the sermon for discussion" on its merits? We do not enter upon the deeper subjects of pastoral experience which have their fitting place in this volume, but we may say generally that this zeal, tempered with much sound sense and discretion, is apparent throughout; and it may be only a survival of the old contempt of Cambridge for the logic of Oxford—a contempt pardonable enough when reading "logic" was supposed to mean picking the horrible dry bones of Aldrich—that two curious fallacies of controversy are gravely allowed a place in these pages, one of them in the course of the story of the Cambridge sermon. "Dean Alford once said to me in after years that he did not think"—we vary the point in question, as well on other grounds as because the incident may have been recorded with some slight inaccuracy—that the Epistle to the Hebrews was written by St. Paul; "but he had no answer ready when I called for a Prayerbook and read" that matrimony "is commended of St. Paul to be honourable among all men." This is *petitio principii*, though the Dean was too polite to say so. The following is "ladies' logic"—called in the schools, we think, "undistributed middle." In a Kentish parish (North Cray) "a document . . . signed by King Philip and Queen Mary gives to the rector of the parish the oblations offered on four special Holy-days in the year for his own personal benefit and increase of stipend." And this is held "to settle a question which many hold wrongly as to the meaning of the word Oblations in our Service." Now, reserving any question as to the exceptional "signature" of this particular document, the ordinary grants of Philip and Mary by Letters Patent are in Latin, attested "per breve de privato sigillo"; and by what other word than "Oblatio" the customary payments on "foure offeringe dayes" which in a document of 1565 are said elsewhere to be "payed orderly as other parishes do," could be expressed, we really do not know. The argument of "Senex" is simply this. Certain quarterly dues are called "Oblations"; therefore, all Oblations are payments for the minister. He has indeed overlooked, or assumed, one material point. He has produced no evidence that these "offeringe-daye" dues were presented at the altar at all; and in the Elizabethan document from which we have quoted they appear in a list with other fees and payments which certainly were not.

Five or six years in India, when the Company was King, furnish matter for a chapter to which the author's motto "I think of bygone days" is peculiarly applicable. All the incidents are striking and are well told, from the lighter story of the young chaplain who tried to preach to (or at) the Colonel for his improvement, with only the result—"For several Sundays' past he has been sitting with his legs up on the ledge, among the Prayer-books, laughing at me," till a six weeks' trial of a different system prescribed by "Senex" "got the legs down," to the darker and stranger incidents of that old Indian life of banishment. One narrative, in which a highly placed civilian has assumed the disguise of a native, might, in the hands of a novelist who could be trusted to treat the subject with the purity and delicacy of touch shown in the outline, form the groundwork of a powerfully dramatic work. Illness and a three

* *Clerical Reminiscences.* By Senex. London: Seeley, Jackson, & Halliday. 1880.

years' furlough brought the author to England, and to a "pleasant Wiltshire town, with its mayor and corporation, its four thousand inhabitants, and its rectory and vicarage. The vicarage was mine, valued at 90*l.* per annum," and the fact that "the Holy Communion had not been administered for eighteen months" is a sufficient evidence that "the parish had been greatly neglected." But it ought to have been explained more fully than in the words we have quoted, that this parish only included half the town. Of his [illegible]er incumbent the author makes no mention—an omission which [illegible] in one respect fortunate, as it enables us to trace the changing attitude of the author towards the baronetage at successive stages of his life. As a Staffordshire curate, he cultivates the local baronet; as a Wiltshire vicar he ignores him; as a Yorkshire dignitary he defies and vanquishes him. It is true that the Wiltshire title was at the time in reversion, and although his Yorkshire "patron was a minor," then only of some eight years old, "victory over the Patron" was perhaps a more signal triumph when it was snatched from his champions the Trustees, of whom one was the Lord Chancellor Cottenham himself. It is a mere jest to conceal the name of the Yorkshire town in which a few years previously the owner of a solitary house—a Quaker, we think—was said to boast that the whole town belonged to himself and Sir J—— R——; but we must humour "Senex." He was presented to the vicarage in 1840, and has been well known in the Church of England ever since. His first fight was for the freedom of the parish church, in which "the patron himself, though entirely non-resident, claimed sixty-five pews in his own right, his agents collecting the rents." "A man of action" was chosen as churchwarden, and "the result was unqualified submission." The rights of the parson came in their turn, after those of the parishioners and the perpetual curates had been secured; and, however weak the logic of the vicar on the subject of Easter dues may appear, his practice was vigorous enough. When a recalcitrant parishioner threatened "to put a knife into the collector if he called again," the vicar simply sent the collector with a bailiff and a distress warrant at dinner-time, with instructions "to seize and sell all the knives on the table." The money was paid; and after a still more lively contest with a rich wool-merchant for dues amounting to one and sevenpence, the Yorkshire admiration for pluck left the vicar master of the field. A similar readiness of wit and promptitude in action cleared away occasional difficulties with curates and with Roman Catholics, and the Vicar of ——— was a moving power in the newly-created diocese of Ripon, till in 1855 his health again broke down, and necessitated an exchange into a small country parish in Kent. Here he obtained his Honorary Canonry, and hence in due time he was removed by Archbishop Longley to a charge which he prefers to designate as "sea-side," and in which he worked hard and successfully for nine years, still, as "always, reckoning amongst the troublers of Israel in these days young ladies, young curates, and young architects. The architects may be changed, and the curates checked; but what can be done with the young ladies?—and, in case of rebellion, who can supply their places?" In this view of things ecclesiastical there is a wisdom arising out of practical experience which for the present cannot be officially recognized in episcopal charges, or find utterance from the judgment-seat of Lord Penzance. There is the Public Worship Regulation Act on the Statute-Book. There are all the Bishops on their Bench; there are all the Judges, in all the Divisions of the High Court and of every other Court, on theirs; and there are all the Congresses and Conferences and Chapters in their ranks of unofficial authority. But there are also "the young ladies"; and the whole body of dignitaries know perfectly well that behind all the other difficulties of the situation lie the two telling questions of "Senex," and the powerful reserve of force which they indicate.

Among the reminiscences of the "Sea-side" is one so singular that in a really anonymous work we should have felt bound to censure its publication as indiscreet. In September 1866, late on one Saturday night, the "person who calls himself Father Ignatius" and his brother "were announced. No notice had been given, and no preparations made"; but Archbishop Longley, "willing to give him a *locus penitentiæ*," and understanding from Mr. Lyne's family "that he desired to obtain priest's orders and to work quietly in the English Church, undertaking common clerical duties," had asked the author to receive him as a curate on probation. Mr. Lyne had brought no directions from the Archbishop, who "had left all entirely with me." A surplice was therefore provided on the Sunday morning, and Mr. Lyne read the Epistle. He was naturally recognized, and "the parish was up in arms." Sunday evening and Monday morning were passed in drawing up a protest, and the churchwarden came in for advice. "I told him that the best thing would be to throw the protest into the fire, for Father Ignatius was by that time safe in London, and they would see him no more." There "had been a great mistake somewhere." Mr. Lyne had only sought priest's orders for his monastic purposes; a two hours' conversation on the Sunday afternoon had almost ended in a fainting fit; Mr. Lyne "was unfit for evening service, spent the time in writing to the Archbishop," and left by an early train the next day.

The closing chapter has for its heading "The Resting-Place," from which our genial old chronicler sends forth his reminiscences, and where he dwells, surrounded by grandchildren and "testimonials." This, however, was not found when first the "kind Archbishop offered me an eligible rectory outside the diocese." He "gratefully declined" it; while most ungratefully he has preserved this memory of his visit:—

The curate was now the *locum tenens*. He was out, but his lady received me, and showed me over the house. Seventeen pairs of boots and shoes on his side; three babies, three laced cradles, and three nurses on hers, proved that there was no want in the house.

Considering that it would be very easy to "spot" this well-booted curate, the story is really too bad; yet the lady may have her revenge. "Three laced cradles" are pronounced by lady critics to be an impossibility. Two might be accounted for; but "Senex" must rest under the imputation of not knowing a cradle from a "cot"—an offence as grave in matronly eyes as is the absence of accents on his Greek in those of his reviewer. Yet we part from him with kindly feelings of gratitude. Books such as this clothe with flesh the bones of Church history and legislation, and help to preserve in life-like form the records of a half-century among the most eventful in the annals of the English Church.

THE HEAD OF MEDUSA.*

"ALL claret would be port if it could," and most American novels would be by Mr. Henry James if they had the luck. *The Head of Medusa* is no exception to this rule. The situations, the "international" combinations of English, Americans, and Italians, are constructed on the model of Mr. James's stories. The sentiment, of which there is a vast abundance, would be after the same pattern—the pattern of the *Diary of a Man of Fifty*—if the author had not in this respect been more influenced by Miss Thackeray. *The Head of Medusa* is a novel in a minor key, in very subdued tones. The characters, though not all Positivists, like one of them, a Mr. Lexeter, are all, like him, people of sentiment. The padding, of which the *The Head of Medusa* is all compact, is sentimental in the manner of Miss Thackeray. The characters are always meeting in lonely places, and in what the author calls "supreme," or "supremest," moments. They then invariably and conscientiously observe all the minute details of sound, hearing, colour, light, and shadow which probably in real life escape the notice of passionate pilgrims. Do people whose emotional mainsprings are tightly wound up really notice and remember such things as that a casual "transient" child wore stockings of different colours? Will some emotional person give his confessions to the public, and tell the truth? The original model of all these passages of writing we take to be the very beautiful chapter by Thackeray which describes how Henry Esmond stood by his unknown mother's grave. Since that was written the management of these casual episodes has become something of a trick. It is a trick which "George Fleming" plays sometimes well, more frequently with less skill. When the heroine, in a crisis of the supremest sort, "spots" and mentally dwells on the unmatched stockings of a child who is nothing to her, we feel our doubts. About the æsthetic interludes, and the pauses of reflection concerning Greek art, we have very little doubt indeed. A novelist who had abundance of matter wherewith to fill up three volumes would not write paragraphs like these:—

The supreme thing is the Greek marble bas-relief of Orpheus and Eurydice. Hardinge stood looking at it for a long time. He often came to see it—this simple, grave, sweet thing, witness of a lost art of naturalness, of propriety of gesture, of harmonious lines and beautifully-filled spaces; a work in which line and mass are more than detail, in which everything is just in emphasis and large in impression, and apart from imitative or realistic art.

And for one moment imagine yourself in his place. Look at delightful fauns piping or dancing, at leering satyrs, at reeling Silenus; look at sleepy, languid, white-armed Bacchus; at well-knit Mercury; see the nymphs, the bacchantes, the mænades, and the marble Venus herself, and confess if this is not to feel like an exile? to look with alien eyes upon these shapes from the old world of smiling existences—a world to admire, a world that has something in it to release one from the stress and torment of business and religion? Aliens and exiles that we are, how close can we get to Greek ideals? Baffled, as before something different to us, remote from us, we gaze and use our critical sense, employ our understanding, and do not surrender to emotion. We miss, before the very images of supremest Greek life and beauty, the blithe, free, open spirit of pure, and conscienceless, and elemental enjoyment to which they best appeal—from which they were born.

On the other hand, here is a remarkable piece of description which, we think, makes full amends for many less fortunate pages. The heroine of the story is watching by the deathbed of a beautiful Italian woman, her rival, when she becomes aware of a singular succession of sounds in the silent streets of Rome:—

"It is the sheep changing pasture," the nurse said, laying down her rosary and listening.

It was a flock of sheep being driven from one part of the Campagna to another, and crossing the city in the dead of night. For nearly a mile the narrow street was blocked with a dim moving mass, now dark and struggling, and now nearly white, as it was lost in the shadow of the houses or emerged into the dim moonlight of the cross-streets. There were thousands upon thousands of them, herded by silent dogs and watched over by mounted shepherds, clothed in shaggy goat-skins, and armed with long lances to which their lanterns were fastened.

In a very few minutes the room was filled with the growing strident bleat of the sheep. The air grew impregnated with a wild musky smell. In a moment, out of the silent summer night, there had arisen the cry of thousands of struggling creatures. The noise which they made was like

* *The Head of Medusa.* By George Fleming. 3 vols. London: Macmillan & Co. 1880.

nothing describable, nothing imaginable. It did away at once with all civilisation. It was like something born of the night, something alien, inarticulate, wild, and strange beyond description.

We have given so much space to these descriptions of accidental detail because, together with passages of moralizing, they make up so very large a part of the novel. The story is so slight that it scarcely seems worth while to analyse it. To be sure, there is not much more of "story" in the lives of the majority of men and women in those brief years of love-making, of choosing, and losing, which, to novelists at least, seem to make up the sum of human life. That things easily go wrong, that mistakes, irrevocable mistakes, are commonly made, that life after these blunders is almost empty except of regret, that the fountains of thought and action can be kept sweet and fresh by loving memory of some one hopelessly lost, this, as we take it, is the moral of *The Head of Medusa*. The heroine, Barbara Floyd, is an American girl of great purity and nobility of character, who marries the wrong man. Half consciously in love with a countryman of her own named Hardinge, she lets herself be drawn into a marriage with an Italian Count Cesco Lalli, and, in about a year's time or less, she is disenchanted. Her husband's character is very happily indicated in this image:—

Once, travelling in the Italian Tyrol with her father, they had spent the greater part of a summer day driving beside the barren rock-strewn expanse which at times was the bed of a stream. She remembered the arid iron-bound look of those mountains; in another way it seemed to her that she was seeing it all over again. And was it altogether Cesco's fault that she had never understood a southern nature? Had he ever pretended to be otherwise than he was? She thought of that Italian stream; and the full pouring surging tide of his passion—breaking resistance and overwhelming retreat—where was it now? There was left to her a bare and sun-scorched wilderness in the extremity of summer.

As long as the author is busy with these two persons, and with a few of her subordinate figures, she appears to us to show real and very considerable power. Barbara Floyd is the daughter of an American gentleman, whose wife had deserted him while Barbara was a child. She has seen very little of the world when she meets Count Lalli at a dance in Rome. Lalli and his friend Borgia, if not true pictures of young Italians, are certainly very like young Italians as seen by English or American observers. Lalli's defect, or one of his defects, is to make a continual display of all his most glittering qualities. He is handsome, bravo, heartless, cruel, a *poseur* of the worst description, who plays at magnanimity about money matters while he is really mean and hard. He is a thing of sentiment, like all the persons in the story, and gives himself up luxuriously to the sense of being in love, though his affections shift every fortnight. With all this, he is adroit, and, by appealing to Barbara for pity and "friendship," he so mystifies the poor girl that she becomes engaged to, and marries, him. Then Lalli, like Sir Launcelot in the romance, "falls to his old love again," hangs about a married cousin, provokes the jealousy of her husband, and is, in a way, the cause of the woman's death. The misery of the life which Barbara leads with this man, on an estate in the country, is only mitigated by the memory of a certain Mr. Hardinge, who has married a friend of her own, Miss Octave Damon. Her husband is quite aware that she loves Hardinge—indeed she has told Lalli as much; but then Hardinge is safely out of the way. The reader may ask, What has the "head of Medusa" to do with all this? As far as we understand the author's meaning, her heroine looked on the Gorgon's head at the moment when she discovered the hopelessness of her own fortunes, and saw herself, at twenty-two, cut off from love and life, a childless woman with an indifferent and unsympathetic husband. In this dolorous case, Barbara is preserved from being actually turned, as in the old myth, into stone, by her memory of her friend's husband, Mr. Hardinge. She takes an interest in the education of the local Italian poor, because Hardinge (who had just taken his degree at Oxford) was interested in popular education.

We confess that we could give poor Barbara more sympathy if she had not consoled herself by an imaginary affair of the heart with the absent and unconscious husband of her friend. That such a sentiment should continue in her breast is one thing; that a good woman should make a mental pet of the sentiment, and a motive that influenced all her life, is another affair. Indeed it is surprising that Lalli, being what he was, did not cut her throat. Old Margherita, the Roman servant of Barbara, tells a story at the beginning of the novel about a Roman shopkeeper who had settled his matrimonial difficulties with a knife. And perhaps we could forgive Barbara more readily if there had been any reason why she should fall in love with Hardinge. He was a good-hearted, handsome young fellow, with a free flow of the usual Oxford talk, which derives its humour from the contrast between the gravity and magnitude of the topics and the light indifference of the speaker. He seems very well mated (at least as far as we have made out his character) with Octave Damon, a pretty American girl, whose practical knowledge of life is a foil to Barbara's want of selfishness and guile. Barbara has another lover, Mr. Lexeter, but, as he has attained to the great age of thirty-five, and is, besides, a writer for the press, he is never in the running. Still we are given a glimpse of a moment when he might have come in with effect, but Lexeter was too shy.

The Head of Medusa is far better than the common ruck of novels. To the utmost of the writer's powers she has striven to produce a work of art; she has written her best; she has conceived her leading characters well; and, though we do not like her moral, it is obviously one that to the author seems adequate. We have already complained of the number and length of the interpolated descriptions of fleeting impressions. Sometimes the impressions make the reader forget all about the characters and events. One has to look back to find out what was going on. Generally not much is going on. There is a passage in the third volume full of "impressions." There is no perceptible wind, but there is a heavy scent of orange blossom. The convent bell rings the quarter. To the end of her days Barbara will never forget the airs some people are playing in the court. One of the v[illegible] makes a blunder in the second bar. Then "somebody was [illegible] ing in whispers in the next room. And there was not a[illegible] sound in the house." So ends a chapter; and now, at last, says the reader to himself, something really is going to happen. It is near the close of the third volume; we have not had a good incident yet; something surely will occur. Perhaps Count Lalli has been shot in a duel, and they are bringing her husband home dead. Perhaps it is Lalli himself that has arrived, in a fury of jealousy, to seize Barbara and carry her away to a dungeon in his ancestral castle. Nothing of the kind. A cousin of Barbara's husband has left her house, and is very ill, and people want Barbara to go and sit up with her. That is all.

The Head of Medusa is thus, at best, a rather favourable and not too original specimen of the melancholy, musing, rather morbid modern novel. We had expected something newer and less after a given pattern. These expectations are disappointed. The book is full of talent, but we had hoped that the talent of the author of *Mirage* would have ripened into something more like genius, certainly into something stamped with the mark of originality. There are some trifling points in the story which may just be worth noticing as capable of easy improvement. The French words, doubtless by error of the printer, are not always spelt properly, and the accents are occasionally misplaced. It is unnecessary to print fragments of Italian in brackets, as when a newspaper translates a foreign despatch, and occasionally offers the foreign idiom of which our language may not possess an equivalent. Lastly, we should like to know what is the Italian for "hang it all, don't cut up rough," words put into the mouth of a young Italian nobleman. Perhaps *The Head of Medusa* will not have been written in vain if it prevents nice English or American girls from marrying Italian Counts like Cesco Lalli. "An Englishman that is Italianate doth quickly prove a devil incarnate," says the old Elizabethan proverb. An English girl that is Italianate must expect, at the very least, to live among ideas and manners so strange to her that her existence can scarcely be made harmonious.

ANTIQUITIES OF ORISSA.*

THIS is the second and concluding volume of Bábú Rájendra Lál's handsome and important work on the *Antiquities of Orissa*. The first volume was noticed in the *Saturday Review* of October 2, 1875, but we may here repeat that an archæological survey of Orissa has been made by the Bábú under the direction of the Government of India, and that these large volumes have been printed at their expense. The survey has been made not a day too soon. Sculptures and remains which were more or less fully described a few years ago by European visitors have entirely disappeared, and the famous inscriptions which forty years ago displayed the sagacity and industry of James Prinsep have made decided progress on the road to ruin. The people of the country have devoted the stones to ordinary purposes, and have set the images up as gods in their houses or village temples. "This process," says the Bábú, "must have gone on for many centuries, and it is rather remarkable that some images should have been extant fifty years ago, than that no traces of any should be found now." With an increase of population and prosperity, the utilization of ancient stone fragments proceeds with accelerated speed.

This second volume is not equal in interest to the first, nor are the illustrations so important. Many of the chief illustrations in the first volume were representations of the temples of Bhuvaneswara, and this volume contains many more from the same fertile source. Here also we have a description of the place in its present condition, and a summary of what is known as to its ancient history. In the present day it is

a small insignificant, uninviting place, with no wealth, no commerce, and no manufactory, peopled by hungry priests, and desolate in every respect. It is nevertheless a most interesting field for the antiquarian, abounding as it does in architectural remains of the highest value, and connected as it is with historical associations of rare importance. To quote the language of the late Lord Canning, used with reference to the plains round Delhi, it is "studded with ruins more thickly even than the Campagna of Rome," and its history affords remarkable illustrations of the vicissitudes in the existence of an Indian town for five-and-twenty centuries.

Bhuvaneswara is undoubtedly an old place, but there can be no hesitation in reducing these twenty-five centuries by ten at least. The earliest date the Bábú has discovered, and that in an untrustworthy "temple record," is 474 A.D. The temples still standing, or in ruins, are assigned to the seventh century. Hiouen Thsang, the Chinese Buddhist pilgrim who visited Orissa in the first half of the seventh century, describes the town as occupying about a square mile of ground; so that, if he is right, the place had not then attained anything like its full proportions. The Bábú goes at some length into the legendary history as given in

* *The Antiquities of Orissa*. By Rájendra Lálá Mitra, LL.D., C.I.E., &c. Vol. II. Published under Orders of the Government of India. Calcutta: Newman & Co. 1880.

the Puránas; but this, though curious, is worthless as history. It is possible that the fine tank and some other remains may date from an earlier period, but this is mere matter of conjecture. There is no doubt that in early times the Buddhist and the Jain religions prevailed in Orissa; for the ruins afford ample proof that they were very strong, if not dominant. But they gave way before the revival of Brahmanism, and many of their images have been renamed and worshipped as Hindu idols. Bhuvaneswara, or, more accurately, Tribhuvaneswara, "the lord of the three worlds," is a title of the god Siva, and the place is sacred to [illegible]. The temples were raised in his honour, and the worship [illegible] goes on is offered to him. One temple dedicated to Bhagavatí, the consort of Siva, some two centuries later in date than the Great Tower, marks the rise of the worship of the female principle, which has since attained a wide and scandalous prevalence. The Great Tower, which is the most conspicuous object in the group of temples, is 165 feet high. The surveyor, wishing to test his calculation of the height by actual measurement, could not obtain leave to do so, but he was allowed to replace the old flag at the top, and so gained his point. A man ascended the giddy height without any preparation, and never hesitated a moment till he reached the summit. He descended even more quickly. This wonderful feat is performed as often as a new flag is required, and no accident has happened within memory.

In our review of the first volume we noticed the grand contention between the author and Mr. Fergusson as to the origin of Hindu architecture. The latter maintains that it owes its origin to the Bactrian Greeks, the former that it is independent and self-evolved. Since the publication of the Bábú's first volume Mr. Fergusson has taken occasion to disparage our author as "hardly sufficiently grounded, either as an architect or archæologist," and his opinions as "not worth much more than the value of the paper on which they may be written." Nothing daunted by this severe criticism, the Bábú returns to the conflict with a calmness that does honour to his temper and with a thoroughgoing conviction in the truth of his own views. He calls to his aid Mr. Locke, of the Government School of Art at Calcutta, who, with every inclination to the Greek theory, finds nothing in the carvings and sculptures to support it. The Bábú appeals to the illustrations in this volume in support of his views. They have their value, and will help in the formation of a judgment. But this great question cannot be settled by the architectural and sculptural remains of Orissa alone. They are far from being the oldest in India, and between their days and the ascendency of the Greeks in Bactria there was ample time for the debasement of pure art, and the effacement of all its delicacy and refinement. But the further discussion of this question is reserved for a future opportunity and a wider field of inquiry, and we may await the conflict of the doughty champions with the assurance that, whoever may personally suffer, art and truth will be the gainers. There is one caution that may be offered to Bábú Rájendra. He shows that he has read extensively the literature of the West; but, as we observed in our previous notice, he is too bold in his identifications. In the first volume he fancied that he had discovered the name of the Hindu god Rudra in many European words. In the present volume he tries to show the identity of the word Cæsar with the Sanskrit title Kesarí borne by some of the kings of Orissa. Dr. Hunter rightly interpreted this word as "long-haired" or "hairy," but the Bábú rejects the Sanskrit origin and interpretation, saying, "Such an epithet would scarcely be worth adoption by a great sovereign and his descendants." His faith in his identification has apparently led him to forget that the god Vishnu in his primitive form, and also in his favourite incarnation Krishna, is very frequently called Kesava, "the hairy," a word of identical meaning. If the title is not unworthy of one of the greatest of the gods, a Hindu can scarcely consider it to be beneath the dignity of a king.

A considerable part of the work is devoted to Puri, the abode of Jagannáth. Notwithstanding its sanctity, Puri is a wretched town on the sea-shore, the home of perennial disease. It is on a wide dead flat of sand, so flat that a ridge twenty feet high, on which the great temple stands, is dignified with the title of "hill." Its fixed population is under twenty-three thousand; but from sixty to a hundred thousand people flock in at the time of the pilgrimage. The great temple is about six centuries old, and although the Bábú considers it "scarcely inferior from an art point of view to the Great Tower of Bhuvaneswara," he admits that it is "less attractive in appearance." Mr. Fergusson's judgment is more severe, and points out its degradation both in style and detail. There can be no question that in the main he is right; but no opinion can be given upon the internal details and ornament, because they have been subjected to the English churchwarden's process of "plastering and whitewashing." The temple records contain an entry of the repairing and purifying of the temple by this process more than three hundred years ago, and the whitewashing has since been often repeated, as often in fact as the incursions and pollutions of the Moslim unbeliever made a purification necessary. The injury done is irreparable; but still it can hardly be supposed that the internal decorations which lie hidden under successive coats of whitewash are superior in character to the architectural style of the exterior; both have probably deteriorated *pari passu*. Antiquaries are agreed that Puri was an ancient seat of Buddhism, and that some relics of the old cultus have descended upon the comparatively modern Hindu deity Jagannáth, "the lord of the world." Jagannáth is a name of horror to Englishmen; but the Bábú steps boldly forward to vindicate his character:—

> No Indian divinity has a more unenviable notoriety in English literature than Jagannáth. Alike in poetry and in prose, in works of imagination as in sober history, he forms a never-dying illustration of all that is cruel, all that is horrible, all that is most revolting to every sense of humanity. His terrible car "through blood and bones ploughs its dreadful path." . . . It is certain, nevertheless, that human conception has never realized a more innocent and gentle divinity than Jagannáth; and the tenets of his votaries are the very reverse of sanguinary or revolting. In fact, never was opprobrium more unjustly cast on an inoffensive object than in this instance, and none merited it less.

This bold vindication will probably excite a feeling of surprise and incredulity in the minds of many; but nevertheless it is perfectly justified by the facts. Jagannáth is only a later form of the man-god Krishna, who was a full incarnation of Vishnu, a god of joyous character, who has no delight in the blood either of animals or of men. Once a year the idol and its two companions are dragged about on huge cars. No less than four thousand two hundred men enjoy rent-free lands upon condition of performing this service. Thousands of pilgrims eagerly lend their aid, some in honour of the deity, others for the mere fun of the thing. In the vast multitudes assembled on these occasions accidents happen, as in all tumultuous gatherings, and probably hardly a year passes without some one being killed. Occasionally a fanatic will cast himself under the wheels, hoping to obtain salvation by his self-devotion; but these cases are rare. Mr. Stirling, the great administrator and historian of the province, witnessed the festival on four occasions, and only three cases of self-immolation occurred in them all; one of these cases was doubtful, and the other two victims had long suffered from excruciating disorders. Another European long resident in Puri adds his testimony that "the excess of fanaticism which is stated in several missionary accounts to prompt pilgrims to court death by throwing themselves in crowds under the wheels of the car of Jagannáth has never existed or has long ceased." Mr. Fergusson, who visited Puri in 1838, did his best to disabuse the public mind of its violent prejudices. He saw "the pilgrims hurrying to the spot, talking and laughing like people going to a fair in England, which in fact it is"; but he found nothing to justify the highly-wrought picture of "the hundreds of dead and dying pilgrims that strew the road and of their bones that whiten the plains." He saw no victims crushed under the wheels, and "none had been heard of for many years before that time." It is clear, from the most unexceptionable testimony, that the horrors of the festival of Jagannáth have been greatly exaggerated; and it is still more clear that the character of the idol is entirely averse to sanguinary sacrifices of every kind.

WRECKED LIVES.*

"'FAILURE,'" says Mr. Davenport Adams, in the opening sentence of his preface—"'failure' from the Christian moralist's point of view, and 'failure' from the point of view of the man of the world, is a widely different thing." How two kinds of failure can be one widely different thing we fail to see. We are willing, however, to admit the fact which Mr. Adams apparently wishes to state, and to pass on to his application. "A Swift," he says in the next page, "may hand down his name and fame to after ages; but was not that a wrecked life which passed away under the heavy shadow of imbecility?" Why, in the name of heaven, we may well ask, need the Christian moralist trouble himself with considering whether or not a man was afflicted with insanity at the close of a long life, unless it can be shown that his loss of reason was a direct consequence of vicious indulgence? If Swift had died at the age of seventy, he would not have passed away under the heavy shadow of imbecility. In that case, if we understand Mr. Adams rightly, his life would not have been a failure, even from the point of view of the Christian moralist. Unfortunately, he lived till he was seventy-seven, and so he fell a victim to imbecility and Mr. Adams. Does our author reckon Marlborough and Somers and Cowper and Southey among those whose lives were wrecked? From Swift he passes in the next sentence to Robespierre. "A Robespierre," he says, "may rule for awhile as the virtual dictator of France; but when his head falls beneath the guillotine of the Place de la Révolution, amid the roar of the voices of hate and revenge, we know that he was a failure." Does Mr. Adams mean to say that all those whose blood is shed amid the roar of the voices of hate and revenge are failures? Surely the Society for which he has written these two volumes was formed to teach a very different lesson.

Of the eleven Wrecked Lives that Mr. Adams has given us we have read but one. We are familiar with his method of compiling, and we are well aware that in no book written by him are we likely ever to come upon a single new fact or a single fresh thought. We have before this shown how he borrows from a writer without owning his obligations, and how in "conveying" a passage—we use the word as Pistol used it—he often makes some monstrous blunder. It would be lost labour, then, to follow his appropriations through two long volumes. It is sufficient to select one of his Wrecked Lives and there to track his footsteps with some little care. He is not indeed a writer that we can ever

* *Wrecked Lives; or, Men who have Failed.* By W. H. Davenport Adams. 2 vols. London: Society for Promoting Christian Knowledge. 1880.

read quickly. His blunders are as surprising as they are frequent, and they will not allow us to pass them by in haste. We are forced almost against our will to get down from our shelves first one volume and then another in the attempt to trace his confusion to its source. We are tempted also to trace out the means by which he succeeds in making so brave a display of learning that he may very well pass for a man of reading with all such readers as he is ever likely to get. The life we have chosen is Swift's. Of Swift, and the times in which he lived, it is abundantly clear that Mr. Adams knows nothing. At least he knew nothing till he set about to compile his Wrecked Life. Yet the airs that he gives himself are as great as they are insufferable. He almost surpasses Sir William Harcourt himself in the assurance with which he lays down the law on a large and difficult question of which the day before he had hardly even heard. There is no reason why Mr. Adams should not compile a Life—a Wrecked Life if so he likes to call it—of Swift, under the direction of the Committee of General Literature and Education, appointed by the Society for Promoting Christian Knowledge. But, while working for such a Society, a little humility would not be out of place. He should not pretend to have knowledge of a subject of which he is profoundly ignorant, and, what is more important, he should not use the words of other writers without owning his obligations. How he deals with Mr. Forster's *Life of Swift* we shall at once show. "I have," he says in a note at the end of the chapter, "consulted this splendid fragment." *Splendid*, by the way, is a most absurd term to apply to this fragment. Mr. Forster had done a great deal of very good work, and we shall always be ready to acknowledge our obligations to him. We have no right to expect that a man's last work shall be up to the standard of the days of his vigour and strength. If, however, we are forced by the extravagant praise of an ignorant writer to express our opinion, truth compels us to say that the *Life of Swift* adds nothing to its author's reputation. We could almost wish that it had never been published. But to return to Mr. Adams. He has consulted Mr. Forster's work. He gives his readers the notion of a student already deeply read in the subject which he has taken in hand, who, before he sets about his task, modestly refers to the latest authority to see whether anything has been added by him to what was already known. A few instances will show to what extent he carried his consultations. For the convenience of our readers we will put in parallel columns one or two of the passages which have been consulted and the result of the consultations:—

MR. ADAMS.	MR. FORSTER.
Though born in Ireland, Swift never called himself, nor would he allow others to call him, an Irishman. He was nothing more, he asserted, than an Englishman settled in Ireland. To others he would frequently say what he wrote to Lord Orford (*sic*) in 1737: that he chanced to see the light there, was one year old when he left it first, and to his sorrow did not die before he went to it again.	He never called himself, nor permitted others to call him, an Irishman. He was an Englishman settled in Ireland. He was in the habit of saying frequently to others what he wrote to the second Lord Oxford in 1737. He happened to be dropped there; was one year old when he left it first; and to his sorrow did not die before he went to it again.—Forster's *Life of Swift*, p. 25.

We may admire perhaps the delicacy which has led Mr. Adams to change "he happened to be dropped there" into "he chanced to see the light." But what are we to think of the almost incredible ignorance which led him to substitute Lord Orford for the second Lord Oxford? Is there a biographer of Swift who has not yet distinguished between a Harley and a Walpole? How Mr. Adams has consulted Mr. Forster in the analysis that he gives of the *Battle of the Books* will be seen by the following passages:—

MR. ADAMS.	MR. FORSTER.
Meanwhile, the feats of Homer were in themselves almost sufficient to decide the issue of the day. Mounted on a ferocious horse, with difficulty managed by the rider himself, but which no other mortal durst approach, he bore down all before him. The names of the victims I cannot here enumerate; but the French suffered terribly. Perrault, plucked out of his saddle by mighty force, was hurled at Fontenelle, the same blow dashing out the brains of both. Inferior only to Homer in valorous efficiency was Virgil, who, bestriding a dapple-grey steed of the highest spirit and strength, careered over the field in search of opponents: but, behold, upon a sorrel gelding of a monstrous size, appeared a foe, making much more noise than speed,—for his horse, old and lean, spent the dregs of his vigour in a high trot, which, though it made slow advances, yet caused a loud clang and dash of arms, terrible to hear! . . . . There is, in short, not a line in this wonderful piece of humouristic fancy, however absurd on the surface, which does not contain an extraordinary depth of meaning.	The exploits of Homer alone went far to decide the day. "Mounted on a furious horse, with difficulty managed by the rider himself, but which no other mortal durst approach, he bore down all before him." Not here may be written the list of his victims . . . but his condign execution on the beginners of the fray is part of my narrative. "He took Perrault by mighty force out of his saddle, then hurled him at Fontenelle, with the same blow dashing out both their brains." Only second to him in efficiency is Virgil, who, mounted on a dapple-grey steed of the highest metal and vigour, busily seeks out objects worthy of his valour, "when, behold, upon a sorrel gelding of a monstrous size," appears a foe making less speed than noise, "for his horse, old and lean, spent the dregs of his strength in a high trot, which, though it made slow advances, yet caused a loud clashing of his armour terrible to hear." . . . There is, in short, not a line in this extraordinary piece of concentrated humour, however seemingly filled with absurdity, that does not run over with sense and meaning.

Mr. Adams is so far original in this passage that he certainly makes a change in the language. What is, however, not a little curious, he makes his changes even when the words are not Mr. Forster's, but Swift's. His caution surely is excessive. There is no copyright of the *Battle of the Books*. An author may "consult" it to his heart's content. It would seem that he did not understand the meaning of the marks of quotation that Mr. Forster uses; for it is scarcely to be supposed that, with all his audacity, he would have ventured to improve on the language of Swift. Be this as it may, by the time he had reached the last sentence in the passage we have just quoted, where the "conveyance" from Mr. Forster is even more barefaced than usual, it was time, he felt, to bring his consultations to a close. Accordingly, he begins with an avowed quotation from the splendid fragment. There is some advantage in such a method as this. The reader natur[illegible] when he sees his author honestly using quotation mar[illegible] that all that had come before was original.

The following is the description given by our two authors—the consulter and the consulted—of Swift's personal appearance:—

MR. ADAMS.	MR. FORSTER.
His personal appearance was calculated to draw attention and gratify the eye. He was about five feet eight inches and a half in height; full but not corpulent in figure, with regular and commanding features; a high, broad forehead, heavy-lidded blue eyes, which under bushy black eyebrows could melt with softness or flash with anger; a slightly aquiline nose, a firm mouth with closed lips, a dimpled double chin, and a general air of calm superiority,—the pride of a man who felt that he was not as other men. Over women he exercised an extraordinary ascendency the ladies of the Berkeley and Ormond families, Mrs. Finch, Lady Worsley, Lady Stanley, Lady Lucy Stanhope, Miss Barton, Mrs. Long, and all the fair wits and intelligent fine ladies of the period, burned incense on his shrine. "When I lived in England," he told Bishop Horsley's (*sic*) daughter at a later time, &c.	His personal appearance was very attractive. Features regular yet striking, forehead high and temples broad and massive, heavy-lidded blue eyes, to which his dark complexion and bushy black eyebrows gave unusual capacity for sternness as well as brilliance, a nose slightly aquiline, mouth resolute with full closed lips, a handsome dimpled double chin, and over all the face the kind of pride not grown of superciliousness or scorn, but of an easy, confident, calm superiority. . . . . Wonderful in his influence over women, to enumerate thus early his female friends would be to name the principal Whig and some Tory toasts of the time. [Here follows the list of the ladies.] . . "When I lived in England," he told Bishop Hoadley's daughter, in later days, &c.

How amazing is the confusion which turns Bishop Hoadley into Bishop Horsley! Has Mr. Adams never read of "the mighty spear of Horsley" which, if we may trust Gibbon, pierced Priestley's "Socinian shield"? He might at all events have turned to his dictionary of biography, where he would have learnt that Horsley was twelve years old when Swift died.

It is not only Mr. Forster that Mr. Adams consults; Sir Walter Scott he has treated in much the same way. He borrows from him without acknowledgment, and modestly repays the debt by improving on his author's language. One quotation shall show the extent of his obligations to Scott:—

MR. ADAMS.	SIR WALTER SCOTT.
From logic, the great object of the attentions of professors and students, he turned away disgusted. His shrewd wit rejected with contempt the cobweb subtleties of Smiglecius, Kockermannus, Burgersdicius, and other worthies, whose writings were as ponderous as their names; nor could his tutor ever persuade him to read three pages in one of them, though some general knowledge of the commentators upon Aristotle was indispensable to passing his examination for his degrees. But it must be confessed that even to more congenial studies he gave but little of his time. He read and wrote chiefly for amusement, and to dissipate that melancholy mood to which, from his earliest years, he was unfortunately predisposed. But in whatever way he read, he must have acquired an extensive amount of various information, since it is known that he had already conceived the idea and drawn out the plan of his "Tale of a Tub."	Logic, then deemed a principal object of learning, was in vain presented to his notice; for his disposition altogether rejected the learned sophistry of Smiglecius, Keckermannus, Burgersdicius, and other ponderous worthies now hardly known by name; nor could his tutor ever persuade him to read three pages in one of them, though some acquaintance with the commentators of Aristotle was absolutely necessary at passing examination for his degrees. Neither did he pay regular attention to other studies more congenial to his disposition. He read and studied rather for amusement, and to divert melancholy reflections, than with the zeal of acquiring knowledge. But his reading, however desultory, must have been varied and extensive, since he is said to have already drawn a rough sketch of the "Tale of a Tub."

Mr. Adams blunders of course in his act of conveyance. Scott's statement that Swift is said to have drawn a rough sketch of the *Tale of a Tub* when at the University is given by Mr. Adams as a positive fact. Mr. Forster states that there is no evidence that any portion of the tale was in existence before 1696—eight years or so after Swift left college.

In one passage Mr. Adams treats Lord Macaulay much as he has treated Mr. Forster and Sir Walter. He is writing of Atterbury's reply to Bentley, and he says:—

> Macaulay calls it a most remarkable book, which reminds one of Goldsmith's observation, that the French would be the best cooks in the world if they had any butcher's meat, for they can make ten dishes out of a nettle-top. It really deserves the praise, whatever that praise may be worth, of being the best book ever written by any man on the wrong side of a question of which he was profoundly ignorant.

"A most remarkable book it is," writes Macaulay in his Essay on Temple, "and often reminds us of Goldsmith's observation," &c. Mr. Adams does not give a single quotation mark to show that the whole of the passage we have just quoted is taken from Macaulay. A man of any reading would of course at once recognize the style of the master, but it is not for men of reading

that Mr. Adams writes. It is curious, by the way, to notice how Macaulay, when he came to write his biography of Bishop Atterbury, goes for his illustration, not to Goldsmith, but to Molière. He disdained, we may suppose, to repeat himself. "It is," he wrote of the Reply to Bentley, "the most extraordinary instance that exists of the art of making much show with little substance. There is no difficulty, says the steward of Molière's miser, in giving [illegible] with plenty of money; the really great cook is he [illegible] set out a banquet with no money at all."

[illegible] have written enough to prove that Mr. Adams is not cured of [illegible] old habits. We have not, however, exposed all the blunders into which he has fallen. We have shown how he confuses Lord Oxford with Lord Orford, and Bishop Hoadley with Bishop Horsley. He makes worse errors even than these. We will not insist too much on his writing Kilrost for Kilroot, and Hester Johnson for Esther Johnson. Such errors are not of great importance. His readers perhaps may be a little puzzled when they come across Harley and Bolingbroke at p. 194, Harley and St. John at p. 195, and Harley and St. John, and Harley and Bolingbroke at p. 166. At the time of which he is writing both men were peers. It is a little more puzzling to learn that Swift began his second period of residence with Temple early in 1676. Even if he had been a most precocious youth, still the age of eight would be unusually early for a human being—man we cannot call him, and child we ought not to call him—to resume his duties as secretary with a retired statesman. But, passing over these inaccuracies as trifling, what are we to make of the Petition (*sic*) Treaty, which led to the impeachment of four Whig peers? In one footnote Mr. Adams tells us that Mr. Charles Boyle was afterwards Lord Denny, and in another that Atterbury was afterwards Bishop of Gloucester. It is easy to account for the first blunder by the assumption that he does not write a very clear hand, and that in copying out his notes he mistook *Orrery* for *Denny*. But his handwriting must be bad indeed if it is to bear the blame of the confusion which has turned Rochester into Gloucester. With his blunders in Latin we shall bring our too long notice to a conclusion. We had observed, in hastily turning over the pages of some of the other Wrecked Lives, *res augustâ domi*, and *pueris virginibus que*. Such errors we might charitably set down to the printer. But what printer's shoulders are broad enough to bear the last half of the epitaph on Swift as given by Mr. Adams?

> Abi, viator,
> Et imitaris (*sic*), si potius (*sic*),
> Strenuum pro virili libertatis vindicem.
> Obiit Anno 1745:
> Mensis Octobris Dii (*sic*) 19,
> Ætatis Anno 78.

This inscription—Mr. Adams's version of it we mean—does indeed, as he says, suggest to the reader a significant lesson. Had the lines, however, been copied, not by Mr. Adams, but by some schoolboy of the lower forms, they might have suggested to his master one of the means by which a lesson may be rendered more significant still. Certainly many a boy has been soundly birched for a far less serious error than writing "imitaris si potius," instead of "imitare si poteris," and for making *dii* the ablative case of *dies*.

ALBANIA.*

MR. KNIGHT'S lively little volume makes its appearance at a very fortunate moment, when such names as Dulcigno and Antivari are in the mouth of everybody. It may be hoped that henceforth they will be consigned again to their natural obscurity; but, be that as it may, Mr. Knight deserves any luck they may bring him. "Travel" is perhaps a somewhat ambitious name for the work he performed, if by travel we are meant to understand the leisurely examination of a country. But he volunteered in an off-hand and light-hearted way for an interesting piece of adventurous touring, carrying it out with spirit, and, on the whole, with success, though he did not altogether attain his main object. He had intended to traverse Northern Albania from north to south. As it was, owing to the force of circumstances altogether beyond his control, he was compelled to stop short of Gussinje and turn back when within sight of the promised land. But, if he did not penetrate those savage districts, which were then as they are now terrorized by the Albanian League, he sampled the scenery and the population from the specimens he saw on the outskirts. He coasted the eastern shores of the Adriatic; he visited the Black Mountain and looked in at Cettinje; he made a comparatively long stay at Scutari, enlivened by sundry excursions in the neighbourhood; and he describes the exciting incidents of the tour with an animation which carries us heartily along with him.

We confess to having been somewhat prejudiced against his little book in the beginning by the vein in which it commenced. The author seemed to lay himself out laboriously to be funny, and we confess that comic travels are our detestation. But we were speedily reconciled to his style, finding it suitable to his subjects and his mode of touring. He was bound to laugh over his hardships, otherwise he must have fallen back on swearing and grumbling, spoiling thereby the pleasure of the trip. We have seldom met with anybody who seemed to set such slight store by minor inconveniences; and in the same way he faced actual dangers with a gay indifference which went far towards disposing of them. How he came to undertake the trip was in this way. One morning last autumn he was sitting in his chambers, cogitating over arrangements for the Long Vacation, when a friend offered a suggestion which came to him like an interposition of Providence. The friend had three friends of his own who were on the point of starting for an expedition in Albania, and they would be delighted to have Mr. Knight to make up the quartet. The introduction was promptly effected; the arrangements were as promptly made; and Mr. Knight started in advance with "Mr. Brown"—he dubs his companions Brown, Jones, and Robinson—to prepare the way for the other two. As it was, thanks to the dilatoriness of Robinson and Jones, the four travelling companions only met much later in Scutari. The party had but vague ideas as to the countries they proposed to visit and the requisites of travel. But Robinson, whose store of actual knowledge proved the smallest, "had evolved an Albania from his inner consciousness," and they equipped themselves for that land of their companion's fancy with articles which never came into use. They carried rifles, for example, for the big game which was non-existent; and a cumbrous tent which was never set up, save on a single occasion when they sacrificed themselves to the enjoyment of it. But, if their outfit showed signs of inexperience or ignorance, they proved themselves of the right stuff for such a journey. They had the very useful gift of making acquaintances everywhere, and of turning casual acquaintances into helpful allies. Without, so far as we are given to understand, having provided themselves with any regular introduction, they were passed on from hand to hand, finding amateur guides and influential travelling protectors. The account of Cattaro, where they disembarked at the foot of the Black Mountain, with the motley population of divers races who crowded the esplanade of an evening, is very picturesque. We see the old Venetian stronghold rising before us, with its battlemented walls starting from either end of the little town and running along the edges of precipices overhanging bottomless abysses, till at length they meet at this crowning fort at a height of at least a thousand feet above the sea level. By the way, *à propos* of Cattaro, Mr. Knight tells a good story of the political knowledge which some of the English envoys carried to the momentous Conference of Berlin. It was a question of bringing the Turks to terms with the Montenegrins, when, if we may trust Mr. Knight, a certain noble lord hit upon a suggestion. "Why not," he asked confidentially of one of the Turkish plenipotentiaries; "why not let the Montenegrins have Cattaro?" The Turk saw no objection in the world; and the Englishman hurried away to one of his Austrian colleagues to intimate that he had found a solution of the knotty question. He is said to have been greatly astonished when the amused Austrian delicately intimated that Cattaro was a fortress of the Empire, and consequently not in the gift of the Turks.

The hill "road" from Cattaro to Cettinje has been often described. Mr. Knight, who is always ready with an anecdote, relates how, when the Prince of Montenegro paid his visit to Vienna, the Austrian Emperor presented him, by way of an appropriate gift, with a handsome state carriage and horses. The Prince was highly gratified; but the carriage still remains at Cattaro, where his horses have been eating their heads off, pending the completion of the road, which is advancing very slowly. In the meantime nothing can be more sublimely beautiful than the views over the Adriatic from the mountain track by which travellers climb to the village capital. Once arrived at Cettinje, however, one is comparatively in clover. Formerly foreign visitors were even rarer than at present, and they were welcomed to the "palace" with primitive hospitality. But, with the increasing notoriety that has been attracting people to the place, the drain on the national treasury would be serious if old customs were kept up. So Prince Nicholas, who knows something of political economy, has turned a cause of deficit into a source of profit. A very comfortable hotel has been started; with an old servant of the palace as majordomo, though the establishment is mounted in characteristic style, and a warlike mountaineer armed to the teeth ushers the guests to the bedrooms in the place of a chambermaid. The Prince is autocratic, and has done much to reform his subjects, so far as their amiable weakness for brigandage and deeds of violence is concerned. But, though the little State is the most absolute of monarchies in miniature, the tone of manners and society is in the extreme of republican equality. Adjoining the hotel is a café fitted with a billiard-table, which is very generally patronized. And at the table, "playing together for pots of Austrian beer, were the Minister of Finance, the Prince's adjutant, the innkeeper, the postman, and the potboy." Although they treated him with extreme civility, Mr. Knight formed no very high opinion of the chivalrous Montenegrins. He hints that their high-bred courtesy of manners and their recent social reforms are owing in great measure to an abiding sense that the eyes of Europe are upon them, and that they are bound accordingly to be on their very best behaviour. They are personally brave and absolutely reckless of life, but in intellectual promise and capacity for political development Mr. Knight ranks them below their Albanian neighbours, whom they detest and affect to despise. It need hardly be said that the feelings of hatred and contempt are most cordially reciprocated by the Albanians, whether Mussulmans or Christians. Nor are the atrociously barbarous practices of their warfare by any means exploded or abandoned, although the Prince, to do him justice, has striven,

* *Albania: a Narrative of Recent Travel.* By E. F. Knight, Barrister-at-Law. London: Sampson Low & Co. 1880.

not quite unsuccessfully, to repress them. In the last war a young Montenegrin was made prisoner; and, as he had been wounded, was sent to the Scutari hospital. Being singularly handsome and prepossessing as well, he was greatly petted by the lady nurses. But from the first an objectionable smell was remarked by his bedside, which gradually became more and more insupportable. The cause was traced to the coat which was rolled up by his side, and in which were eighteen Turkish noses, the cherished trophies of the young warrior's campaigning.

When Messrs. Knight and Brown had crossed the frontier into Albania, they found they had to rough it in earnest, and their hardships were occasionally spiced with danger. They had to fall into the country fashion of sleeping in their clothes, making their night toilet by simply removing their boots, and resigning themselves, with what serenity they could muster, as a prey to legions of hungry insects. Indeed the Albanians carry their horror of ablution so far that when Mr. Brown committed himself thoughtlessly to a bath in the river, his companions had to explain away his conduct by setting it down to an enfeebled intellect. Nevertheless the people were extremely friendly and hospitable; nor would the Englishmen have had much difficulty in exploring the country, had it not been for the existence of "the Albanian League," and for the fact that they had retraced their route so far from Scutari as to pay a flying visit to a Montenegrin camp. Considering that they had been so recently in communication with the enemy in arms, it was not unnatural that they should be regarded with suspicion, nor would it have been astonishing had they been treated as spies. Fortunately they had an excellent friend in our well-known Consul, Mr. Kirby Green, who seems to have established an extraordinary influence over the half-savage inhabitants of these mountains. At that time the League had its headquarters in the mountain fortress of Gussinje, and Messrs. Knight and Brown had set their hearts upon going thither. Though they failed, they did all that men could do to succeed; and, had they succeeded, it is improbable they would have survived to narrate these thrilling adventures. Ali Pasha commanded in the place, a man deeply compromised in the murder of Mehemet Ali at Jacova, and he had a force under him that was variously estimated at from six thousand to thirty thousand men. But, though estimates of his strength varied so widely, there was no difference of opinion as to the *morale* of his men. They were either fanatics of the most savage type, or the scum and dregs of some of the surrounding tribes. Of their bigotry, and their thirst for the blood of the infidels, the English travellers were nearly having a conclusive proof. After several futile attempts at obtaining influential escorts or satisfactory safe-conducts, they had reached a hut within two hours' march of the fortress, where they hoped by negotiation to carry out their plan. Ali Bey was frank enough—at all events he offered them impossible conditions. If they chose to come to him, they must come as hostages to answer for the withdrawal of the invading Montenegrin troops. Accepting that as his last word, they had reluctantly decided to turn back, when a couple of armed ruffians arrived at the hut, professing to come as the Bey's envoys. It proved to be the object of these scoundrels to lure the strangers into an ambush, or, failing that, to murder them where they were. The Englishmen escaped, thanks to the presence of a Franciscan missionary and the loyalty of the mountaineer at whose table they were seated; and having seen enough, as we should imagine, of the manners of the country, they made their way back through Montenegro to Dulcigno and Antivari. But, although they had an exceedingly interesting and exciting trip, which they have related in a very pleasant little volume, we may doubt whether it will become a fashion with English barristers to spend the Long Vacation in Albania.

ADAM AND EVE.*

IN *Adam and Eve* Mrs. Parr has produced a story marked by many merits, and injured, as three-volume novels too often are injured, by what we cannot but regard as a blunder committed in the third volume. The author has laid her scene in an out-of-the-way fishing-village in Cornwall, and has dated it at the time when smuggling was still a profitable if dangerous calling, regarded by its followers, honest enough in other matters, as a perfectly legitimate, if not legal, means of making money. Smuggling, it may be remembered, carried on in the same circumstances, but in a different place, played an important part in a novel of Mr. Blackmore's which we reviewed not long ago, and it is only lately that Mr. Hardy wrote for a magazine which has since vanished a telling story of a few chapters which dealt with the same subject. It is one which offers many temptations and advantages to a novelist, affording constant opportunities for picturesque description both of scenery and of a mode of life which is now practically extinct. Of these advantages Mrs. Parr has made the most. Her descriptions of nature in its varying moods, and of the dispositions and ways of the strange and interesting folk among whom she takes us, are capital. Nor, till we come to the mistake to which we have referred, is there any serious shortcoming in her treatment of the important characters. With this exception, they, like the people who have a less direct concern with the plot of the book, are well conceived, and drawn with a lifelike vigour. But, as we have said, when it becomes necessary to bring about a catastrophe, her powers fail her, and with a strange want of the dramatic instinct which is absolutely necessary to a novel with a serious plot, she makes perhaps her best-drawn character up to that point do a deed so repugnant to his whole nature that no skill or power could reconcile us to the glaring contradiction. A possibly minor fault, which however also exhibits a want of appreciation of character, [illegible] deed is led up to by a precisely similar one committed [illegible] of the hero's, under the influence of feelings which might [illegible], if they could not excuse, the offence. Reuben May's action in betraying Eve's lover with all his companions into the hands of the Excise officers is, if not very attractive, conceivable enough, especially when it is remembered that, according to his views, he was saving Eve from a terrible fate by what he did. Adam Pascal's subsequent action in turning King's evidence, under the influence of an unfounded jealousy, against the comrade who had long served under him is outrageously inconceivable, and the inevitable result is that the reader loses all interest in the book when he comes to this extraordinary incident, which, fortunately perhaps, occurs at the latter end of the third volume.

Adam and Eve opens with a vivid description of the heroine's distressed condition. Her mother, who has lately died,

> had come of a family who had seen better days, in right of which they could never overlook that their orphan cousin had thrown herself away on a common seafaring man who had nothing but his handsome face and his dare-devil stories to set before her; and although the despised husband never returned from the voyage during which Eve was born, the relations saw in this no cause to restrain their tongues, nor (*sic*) alter their judgment, and the sore-hearted widow, resenting these continual jobations, gradually withdrew herself from her family, until not only had all communication ceased between them, but their very existence was no longer known to her.

On the other hand, Mrs. Pascal knew nothing more of her husband's family than that he had "a brother and some cousins living in an out-of-the-way village in Cornwall," and, from what she had heard of them she felt "that she would sooner beg her bread in London than live at ease with those who, to use her husband's words, feared neither God nor devil." Thus the offer which came from these people to "do for her and the little maid," if they would come to Cornwall after Andrew Pascal's death, was not accepted, and it was more a feeling of respect due to Pascal's memory than anything else which made Mrs. Pascal on her deathbed command Eve to write to her Cornish relations. The orphan daughter is somewhat puzzled by the letter of invitation which comes in reply; she would like to go to Cornwall; but she does not know where to house the old furniture, which was a kind of fetish to her mother, until she thinks of her friend and admirer, Reuben May, the watchmaker. The scene which follows between the two when Eve goes to make her request to Reuben is both true and pretty, and it ends with an understanding "that, though there was no engagement on either part, each was bound, in case of change, to render an account of his or her feelings to the other." Still truer in its perception is the ensuing scene where Reuben comes to help Eve on her way to the ship which is to carry her to her unknown relatives at Polperro. She is waiting for him alone at four o'clock in the morning, full of doubt and perplexity as to her future, and as to whether she does right in going to Cornwall, instead of staying, as her mother had wished, working at her lace-mending in London. "Did it not seem as if she was forsaking that mother in thus going away from all that while they were together had grown familiar?" She is overcome by her memories and emotions, and bursts into a passion of tears, which prevents her from hearing, at first, Reuben's approach as he enters the room. Reuben, on his side, is deeply moved by the sight of her distress, and is undecided what to do. "Alas, poor Reuben! had he loved less he would have ventured more, but great love is seldom venturesome; held back by a thousand emotions, it stands trembling on the threshold over which a more selfish passion strides triumphant." Moved, then, by a purely unselfish desire to spare Eve pain, he represses his own feelings, and addresses her in a tone of commonplace surprise:—

> "Come, come, Eve; why, what are you thinking of? I thought to find you ready and waiting for me; it won't do, you know, to drive things off to the last minute, or if so——" and the rest of the sentence was drowned by the noise he made in unnecessarily dragging a box from one side of the room to the other, after which, expending a further surplus of energy in giving vigorous pulls to sundry stray pieces of rope, Reuben turned to find Eve standing up ready and waiting.
>
> At sight of her wan face all his firmness seemed to desert him, and involuntarily stretching out his hand he laid it on her shoulder.
>
> "Eve," he said, "my dear one, if you could see my heart torn in two to see you suffer!"
>
> But the sympathy had come too late, the recoil had been given; those first few words had turned the depth of feeling back upon herself, and the heart which lay cold and dull within Eve no longer felt reproach for herself, nor craved sympathy for her suffering.
>
> "I'm quite ready now," she said, with a little movement which told Reuben more effectually than words that his small show of affection was displeasing to her. "I've said good-bye to everybody, I'll take these small things down, and tell the man to come, and you'll help him with the boxes on to the truck?"
>
> "Then ain't you coming up again?"
>
> "No; I shall go slowly on, and you can overtake me;" and, without another look at him, or at the room she was leaving, Eve went downstairs and passed out of the house into the street.

Just before she goes on board the vessel which is to take her to Polperro he makes one wild appeal to her to stop, impelled by a

* *Adam and Eve.* By Mrs. Parr, Author of "Dorothy Fox," &c. 3 vols. London: Richard Bentley & Son.

strange presentiment of coming evil; but she answers him only that it is too late.

Eve's journey to and arrival at Polperro are given with much vividness and humour, as is the account of her surprise at the luxury of her uncle's house, in which she is received by his niece and her cousin Joan, whose character is singularly fresh and pleasant. The talk of the various village people to whom she is by degrees introduced is full of life and character, and the Cornish [illegible] well and correctly employed, without ever becoming [illegible] Eve is full of delight at the view of the sea which she [illegible] a point near the house; and, when Joan comes out to bring [illegible] in to breakfast, apologizes for her delay by saying, "It is so lovely; oh! I could spend my day looking at it!" "'Looking at it,' repeated Joan; 'looking at what? Where have 'ee been to the top to? Why the maid's mazed,' she laughed; 'there's nothin' up there to look at.'" Later on the two girls pay a visit to a house in the village, the hostess of which says of Eve's manner of speech, "Doesn't her clip her words? 'Tis a purty way o' talkin' though, and all's of a piece with her." Then she adds, with a look at Eve's black gown, "You've a lost somebody, my dear, haven't 'ee?" and, on Eve's explaining that she has lost her mother, goes into a discourse on the subject, which is worth quoting:—

"Ah, that's a sore loss, that is. I've a lost my awn mother, so I can tell. Poor old sawl! I thinks I see her now! When we childern had bin off, nobody knows how long, and her worritin' and thinkin' us was to bottom o' say, her'd come out with a girt big stick and her'd *leather* us till her couldn't stand, and call us all the raskil rogues her could lay her tongue to. I often thinks of it now, and it brings back her words to me. 'You may find another husband,' her'd say, 'or have another chield, but there's niver but the wan mother.' And some o' that chaney there was hers. Well, that very cup and saucer you'm lookin' at now belonged to she! and so you take it, my dear, and keep it. No! nonsense, but you *shall*, now!" for Eve was protesting against accepting such a present. "'Twill only get broked up into sherds here; and if her was alive, you'd a bin welcome to th' whole dresserful, her was such a free-handed woman! Chaney, tay, liquor, no matter what—so long as she'd got, she'd give."

After this we plunge deep into the strange and interesting life of the smuggling village, with its odd ideas of morality and its perfect contentment with the laws which it has made for itself. Only one person, Adam, Uncle Zebedee's son, has any doubt as to the fitness of these and the propriety of the trade by which the whole village may be said to live; and he, finding that radical reform is impossible, temporizes by taking the leadership to which his bodily and mental powers seem naturally to appoint him, and doing his best to preserve such order and controlment as is possible. This is a state of things which makes him, if feared and admired, not half so popular as one Jerrem, who, having been picked up when a child as a castaway from a wreck, has been adopted by Joan's family. His winning, facile ways had in childhood and boyhood robbed Adam of some portion of the love which should by right have been his, and the early antagonism has not disappeared when the two grow up to manhood. Jerrem, thoughtless and mischievous, takes a certain delight in flaunting his social accomplishments in the face of the stern and thoughtful Adam, and is the cause of much heartburning to Adam in respect of Eve. There is the more reason for this because Uncle Zebedee had expressed a decided wish before Eve's arrival that a match could be made between her and Jerrem. Adam, however, in a love-scene which is strong and simple, declares himself, and is accepted by Eve; and their happiness is marred only by Jerrem's foolishly continued attempts to make an impression upon her, by her consequent alarm as to the probability of a serious quarrel between the two, and the enforced absence of Adam in pursuit of his illegal calling, until the plot is thickened by the arrival of Reuben May from London. He has heard of Eve's engagement, and has come down to Polperro with the intention of dissuading her from marrying Adam, having first managed honestly to persuade himself that his personal interest in the matter from a lover's point of view is at an end. He has come, he says, "to speak to you like a friend, and ask you to tell me what sort of people these are that you're among, and how the man gets his living that you're thinking of being married to?" Eve replies that he evidently knows all about it, and he retorts by asking whether what he has been told is true. "'Oh! I daresay it's true enough,' she said; 'people ain't likely to tell you false about a thing nobody here feels ashamed to own to.' 'Not ashamed of being drunkards, law-breakers—thieves!' said Reuben, sternly." At this Eve naturally breaks out in wrath, and Reuben as naturally by his succeeding remarks irritates her more and more, until, moved by a sneer of his, she lets out in the heat of the moment a piece of information which Reuben afterwards remembers with fatal effect. Here, as may be guessed, is the beginning of the catastrophe of which we have spoken; and though in the conduct of this and the winding up of the book there is one capital flaw, it must be admitted that, in the management of the various accidents which lead up to the crisis in an unforeseen way, Mrs. Parr has displayed not a little ingenuity and talent for the weaving of an intricate, but not too intricate, plot. Any shortcomings which may exist in this we could readily consider as outweighed by the writer's manifest merit; but we cannot pardon the deliberate conversion of a high-minded man at a moment's notice into one who does not scruple to seek the very meanest means of gaining, as he thinks, his revenge. It is irritating to come upon such an incident as this at the end of a book which is so full of interest, and which contains so many striking scenes, and such pleasant, fresh, and well-drawn characters.

STEVENSON ON HOUSE ARCHITECTURE.*

WITH some books the reader's first question is, naturally, "What does he say?" and with others, "What does it say?" Those who have concerned themselves with the architectural polemics of the past decade will be apt to put the former interrogatory when they recollect that the author of these volumes was not only a fervent combatant in that onslaught of anti-restorationists and knights of Queen Anne which so sorely vexed Sir Gilbert Scott's later days, but that his artistic achievements are among the conspicuous features of Lowther Mansions and Pont Street, not to mention other quarters of London. We are glad to say that readers who may buckle to in hopes of seeing sport will be disappointed at the author's cautious peacefulness. On the other hand, genuine students will be rewarded with a well-written, painstaking, and matter-full, though sometimes diffuse, treatise on the subject-matter indicated on the title-page, composed (with now and then a slight revelation of preference) in an eclectic spirit, and utterly incapable of giving a triumph to any side in a controversy which labours under the difficulty that the assailants are always compelled to wage a Parthian warfare.

Indeed the Introduction, in its forcible insistence upon reality of planning and material, sounds like an echo of Pugin's still stinging *True Principles*. Yet, effusive as Mr. Stevenson is in his praises of Mr. Ruskin from one end to the other of his work, there is not the slightest reference to Pugin; as far as he is concerned, no Pugin might ever have existed. Not for the first time we find ourselves compelled to ask with some indignation, Why are our æsthetic lights of a younger generation so forgetful, or, it may be, so ignorant of—but under either theory so ungrateful to—Pugin's great services to artistic truth? At the time when he wrote, his unpopular belief might have been urged as an excuse, though a very poor one. Now, however, folks pretend to be tolerant, if not indifferent. Akin to this strange omission is a remarkable chronological inaccuracy in p. 23 of the first volume, where Mr. Stevenson fixes on a period between twenty and thirty years ago as the date when contempt for beauty in the streets of our provincial towns was at its climax, instead of recognizing that at about that date the tide had begun decidedly to turn in favour of architectural composition.

We shall make no attempt to digest the vast mass of historical information contained in Mr. Stevenson's first volume. Of course a treatise which ignores the existence of any ideal types of style cuts itself off from the appreciation of the highest excellence. But from his point of view Mr. Stevenson is laborious and fair, and his style is sometimes forcible, although in every portion of the work it would gain by compression. He has in one respect a clear advantage over other historians of architecture—namely, in his selection of a range of study so precisely limited as one which altogether excludes ecclesiastical structures and, to a large extent, public buildings. At the same time, the limitation must be a distinct impediment to any broad appreciation of chronological architecture, as the investigator is cut off from so many very important classes of world-famous examples. The variety of cosmopolitan sources from which Mr. Stevenson derives his examples is very praiseworthy, though we could not help being a little amused to find at last that the building on which the brightest aureole of encomium seemed to rest was the old College of Glasgow, a picturesque structure of the seventeenth century. A similar patriotism makes Mr. Stevenson repeat more than once, as something rich and rare, the presentment of a phase of *bourgeois* house, for which, as we are told, Scotland in the eighteenth century was responsible, comprising in one grim whole a central door, oblong windows stiffly matching on either side, and big goggling dormers in the roof. Few of his readers, we should think, would share in his regrets at the decadence of this offshoot of provincial ugliness.

The number and variety of the woodcuts add considerably to the attractiveness of both the volumes, while, by a refinement of consideration for the reader's trouble, several which serve to illustrate more than one passage are on each occasion repeated.

In the second volume the author, as he himself points out, travels over much the same ground as Professor Kerr did in his well-known treatise. We are unable to agree with the dislike which Mr. Stevenson expresses for the multiplication of specialized rooms. He is driven by way of argument to assert that "empty rooms make a dreary house." We ask, why so? They make an airy one, no doubt, as stuffing and cramming never can do, and so much the better, and when they are not wanted they can always be locked up. To be sure, they also make it to a certain extent an expensive house to keep up, and this to persons of moderate means would be a reasonable objection. Expense is not, however, the ground of Mr. Stevenson's exception; but, as far as we can gather, an odd sort of feeling of loving perpetually and at all hours to abide among identical objects.

Mr. Stevenson is very minute in his study of the details of comfort as it is enhanced or checked by the relative size and position of the rooms, and we willingly recognize much which is valuable in his suggestions. But what glamour came over him that he does not offer the loudest of warnings to his clients against those persecutors of all righteous house-planners, the bellhangers? Our ubiquitous and philanthropic Home Secretary ought really to turn his attention for a few moments from juvenile delinquents to those far —

* *House Architecture*. By J. J. Stevenson. 2 vols. Vol. I.—Architecture. Vol. II.—Planning. London: Macmillan & Co. 1880.

malignant enemies of society. We fear the ladies would frown upon Mr. Stevenson's dictum that in bed-rooms, or of course in dressing-rooms, the dressing-table should stand against the wall between two windows, so as to hide the ugliness of the back of the looking-glass. Did it never strike the writer that the exceptional darkness which specially signalizes this particular portion of every room would be hardly propitious to the use which ladies at all events are apt to make of looking-glasses? As to his reason, all we can say is that the back of a looking-glass may easily be made ornamental. Surely Mr. Morris would not faint before the labour. In his speculations upon the shape and proportions of dining-rooms the author quite forgets the probability of the judicious householder procuring a round table, and thus, like Arthur and Edward III., purchasing sociability and pleasant converse at the cost of stiff dignity. The speculations on the philosophy of the billiard-room are thoughtful, although we quite demur to Mr. Stevenson's placing it before himself as an object to make it easy to play billiards in shirt-sleeves. We have always looked on a billiard-room as the triumph of civilization, and not as a survival of savagery. A billiard-room which is not accessible and acceptable to the ladies of the family had better not form part of a private house. Let the ladies allow shirt-sleeves—we would only praise their sense and liberality. But we protest against the architect building for shirt-sleeves, and so ousting womanhood of its rights in a room of common amusement. We may remind Mr. Stevenson that the one Scotchman to whom a joke was not forbidden fruit summed up the philosophy of billiard-rooms in a single sentence. The billiard-room, according to Henry Drummond, ought to be separate from the other living-rooms, because its object was to draw away the bore after breakfast. It is inexplicable that Mr. Stevenson, who has devoted so much thought to placing his billiard-room in correspondence with the other apartments, should be quite silent upon that which, merely viewed as a constructional problem, is one which will more closely test the architect's capacity—the placing, the adjustment, and the fitting up of the domestic chapel. Yet Mr. Stevenson must be well aware in how many cases the domestic chapel has been restored in or added to an old house, or else made part of a new one. Sometimes it is an apartment fitted with all the requisites of complete worship, sometimes a simple prayer-room. In either case, however, it is an enterprise in which the house-builder may succeed or bungle; so that he has a strong claim on the apostle of house-building for guidance in that which is assuredly a branch of domestic architecture. An Agnostic would be no more compelled by Mr. Stevenson's handling the topic to garnish his house with a chapel for devotions which he despised than a Puritan who took our author as his guide would find himself under the necessity of providing a billiard-room for amusements which he condemned.

In his advice about nurseries Mr. Stevenson shows considerable good sense, while he aptly illustrates the difference between English and French social notions by the inadequacy of the nursery suggested in M. Viollet le Duc's *Histoire d'une Maison*. We sympathize with the author's protest against Professor Kerr's tendency to create too fastidious a seclusion of servants from the employers. The separation of sexes is quite another matter. The kitchen and its relations to the dining-room are well thought out, but among the uses and apparatus of the "service-room" the writer forgets a tap of fresh water, with a sink. Facilities for quickly and completely washing plates, forks, spoons, and glasses during the progress of dinner greatly economize the servants' labour and add to the comfort of the guests. Only to mention one more point, Mr. Stevenson duly appreciates that pleasant apartment found in many modern houses which is partly central hall and partly living-room. The architect, however, who plans it must be careful in his precautions that its interior is not in sight from the front door, and that the servant who confronts visitors is able to take unseen the pleasure of those inside.

AMERICAN LITERATURE.

LIEUTENANT VERY'S treatise on the naval armaments of the world (1) has the merit at least of recency and completeness, bringing down our information as to the relative force of different navies to a very late period. The author does not always distinguish with sufficient clearness—or perhaps does not indicate to readers unacquainted with the technical form of official reports—what ships are actually afloat and in service, what are antiquated, and what are building, or, if built, not yet completed so as to form an actual effective part of the fighting force of the country to which they belong. Moreover, while giving in the text an elaborate, and often a very intelligible, description of each of the more powerful and more recent vessels individually, he leaves the reader to seek in the tables facts without which the description is worthless for purposes of comparison—as, for instance, the thickness of the armour. Almost every effective ship afloat finds a place in his list, and her general character is so far indicated, in terms perhaps not more technical than is necessary to distinctness and brevity, that any professional reader, at all events, can understand her nature, and form at least a general idea of the comparative strength of different Powers in each class of vessels. There is an almost equally full and careful account of the different systems of gunnery, of the guns constructed, the principles of their construction, the factories where they are cast, and the especial merit claimed for each in strength, projectile force, and facility of movement. Two points will probably strike the unprofessional reader—first, the extreme difficulty of forming an estimate of the actual effective [illegible] of any single navy, and still more the impossibility of a[illegible] distinct place to each, of estimating accurately the po[illegible] to one or another by the number and strength of the [illegible] vessels of which it can dispose. It seems utterly i[illegible]ble even to conjecture what might be the result of a naval war in which two or three Powers might be engaged on either side. One State may be enormously superior to another in the number of effective fighting ships; but the latter may have one, two, or three reckoned as superior to any that the former possesses. No person unfamiliar with the technicalities of artillery and naval construction can form any adequate notion which of the two is really the stronger; what, for example, might be the result of a contest for the supremacy of the Mediterranean between the fleet of England on the one hand and those of France and Italy on the other. How important a single vessel may be the late South American war has taught us. This is perhaps the one lesson which as yet can be with any confidence drawn from a struggle waged under very exceptional and apparently very interesting and instructive circumstances. Chili had the best of it in every other point. Her troops, her power of movement, her military policy, the strength and foresight of her Government, were all superior to those of the allies. She was considered almost equally superior in naval force. But, so long as the *Huascar* remained in Peruvian hands, it seemed, to the outer world at least, that Chili was getting the worst of it. Caught at last by the two Chilian ironclads, the *Huascar*, which formed the sole strength of the Peruvian navy, was taken, and in Lieutenant Very's list she figures as a Chilian vessel. Since her capture the allies have been uniformly worsted by sea and land, have not, we believe, achieved a single success, even a local and temporary victory. It may be that the brilliancy of the *Huascar's* exploits led the general reader greatly to over-rate their practical importance; but it seems certain that with her capture the hopes as well as the fortunes of Peru and Bolivia were utterly and instantly overcast. Perhaps no one vessel could possibly play such a part in a contest between two first-rate or even second-rate Powers; but it is at least conceivable, so far as the general public can see, that the possession of two or three impregnable, or nearly impregnable, vessels, equally well handled, might afford an almost equally important advantage to the inferior navy, and that, if that advantage were well employed, it might, at least for a time, seriously affect the balance of military success. We should like, moreover, to see the lesson of the *Huascar's* exploits treated by a competent professional authority from another point of view—to be informed how far it tells in favour of the idea still maintained by a few old-fashioned and thoughtful judges, that seamanship, skill, and naval tact will play as great a part as ever in maritime war. A very interesting portion of Lieutenant Very's book deals with the maritime engagements of the last twenty years. This period of course excludes the Crimean War. It includes that part of the American Civil War in which the ironclad, or monitor, was yet in an imperfect and inchoate state. The Confederates never had the opportunity of encountering their enemies on the open sea; even on the inland waters they never met upon anything like equal terms. But there were contests between forts and ships whose lesson may be in its way more important than any to be derived from such encounters between armoured vessels as have yet taken place. As a general rule, it may be said that earthworks seldom held their own for more than a few hours against such naval forces as the Federals were able to bring to bear; but it must be remembered that the Federal artillery was greatly superior to that of the Confederates. Even in the field the best Confederate batteries were, almost without an exception, those that had been captured by the prowess of their infantry and cavalry. This fact gives the more significance to the comparative success of Confederate forts defended by masonry, or of more regular construction. In two cases of importance the Confederate earthworks were found too strong for the rude Federal ironclads. At Fort Donaldson two out of four of these, carrying 13 guns apiece, were disabled by the loss of their steering-gear, and the other two were forced to retire, for fear of sinking, by a triple row of earthworks, the lowest of which alone, on the water level, was silenced by the fire of the squadron. On the James River two monitors of somewhat superior construction, and three wooden gunboats, were beaten off by Fort Darling, an earthwork 200 feet above the James River. Forts Moultrie and Sumter utterly baffled throughout the whole war the utmost efforts of the strongest squadron the Union could spare for the attack of the most important and most hated of the Confederate seaports; the defeat on one occasion being quite as signal as any of the successes obtained by the Federal fleets elsewhere. Fort Jackson, a masonry fort below New Orleans, held out for ten days against Farragut's squadron. In fine, out of four attacks on masonry, only one succeeded; out of fifteen attacks on earthworks, only three failed completely. It appears, also, that in nearly every case the strongest Confederate earthworks failed permanently to prevent the passage of the Federal flotilla within six hundred yards. The remarkable weakness of the American navy at the present moment is a notable

(1) *Navies of the World: giving Concise Descriptions of the Plans, Armament, and Armour of the Naval Vessels of Twenty of the Principal Nations, &c.* By Lieutenant E. W. Very, U.S.N. London: Sampson Low & Co. 1880.

fact. There is scarcely one European naval Power of the second, or even of the third rank, against which, according to the usual estimate of effectiveness, the American armoured fleet could be expected to win a regular naval engagement on the high seas. But how far a number of small well-handled gunboats carrying one or two heavy guns apiece may hold their own against an enormously superior nominal force concentrated in a very few great ironclads, [illegible]ch [illegible] an easy mark, is a question yet to be solved.

[illegible]'s monograph on the *Footprints of Vanished [illegible] Mississippi Valley* (2) contains little absolutely new [illegible]ion, and points to no new and trustworthy conclusion [illegible]ing that most curious and interesting problem of archæology, the history of the Mound-builders. But it adds a good deal of detailed evidence to that already accumulated, and tends, we think, very strongly to sustain the author's argument that the Mound-builders could by no possibility have degenerated into anything like even the highest and most civilized tribes of Red Indians known to the earlier European settlers of North America. Whether or not before the European invasion the Indians were already degenerating or dying out, is a point on which as yet the majority of archæologists would probably hesitate to pronounce a confident opinion; but that the strongest of them were mere isolated tribes of hunters, for whom agriculture was a secondary resource, and whose fortifications were wholly rude and unscientific, appears absolutely certain. The more carefully and fully the works of the Mound-builders are studied, as they have been studied by Dr. Conant, the more distinctly does the high comparative civilization of that strange race stand out. It seems certain that they possessed a mathematical knowledge of which no Indian tribe has retained a vestige. They must have had a complicated religion, a highly organized government, and a military power far from contemptible; while only an elaborate and extensive agriculture could have furnished food, only a large and intelligent agricultural population could have afforded labourers, for such enormous non-productive works. On the purpose of these works, especially of those strange, mysterious mounds in which the form of the mammoth and numerous other animals is clearly traced, Dr. Conant can throw little new light. The question seems to have baffled all investigators, from whatever point of view they have approached it. Perhaps the most interesting speciality of the present treatise is the account of the canal works connecting lakes and river systems, which, if they do not certainly prove, at least suggest, the possession by the Mound-builders of a navy, military and mercantile, worthy of the vast inland water system available to them, and whose value they would seem to have appreciated. From the existence of such canals, whose size indicates navigation, not irrigation, as their purpose, it seems almost an inevitable inference that the empire of those who constructed them extended from the lower, or at least the middle, part of the Mississippi Valley, across the Ohio and the Missouri, as far as the great lakes from which they derived their copper, and probably far to the east—certainly, we should assume, to the Alleghanies, if not to the sea-coast. The existence of such a race would not be at all extraordinary. Their civilization is indicated by their monuments; its defects—probably consequent on the want of stone throughout the greater part of their territory—as well as its extraordinary development within special limits, are intelligible enough; and even if we admit Dr. Conant's doctrine that their earthenware is superior to that of any of the prehistoric races of the Old World, we need hardly suppose them to have been greatly superior to the founders of the Mexican and Peruvian Empires. What is extraordinary and unprecedented in their story is their utter disappearance, leaving not even a tradition behind them, before—nobody knows what or whom; hardly, we may presume, before the scattered savages whom Spanish, Dutch, French, and English explorers found in possession of their deserted territory. This is the peculiarity of the problem, and Dr. Conant's treatise does no more than accumulate some further special and detailed evidence of a kind which renders it more perplexing the more fully it is studied.

Mr. Morais's book (3) might have been at once very interesting, and not a little instructive; but we can hardly think that it is either the one or the other. His sketches are too short to afford any true insight either into the personal character of the men whose career he rather indicates than delineates even in outline, or into the effect of their creed, and their relations to one another and to the outer world, upon their character and fortunes. Moreover, a vast majority of those selected as examples of the intellectual and social eminence attained by members of the Hebrew race within the present century are hardly important enough to find a proper place in such a work. A few of Mr. Morais's characters, like Isaac D'Israeli and Achille Fould, are really among the eminent men of their time; but, on the whole, we are somewhat surprised to find how few Hebrews have attained the first rank, not only in politics, where their race or creed most tells against them, but in art, science, or literature. A dozen, or a score, of the personages enumerated in this volume might properly find a place in such a dictionary as that entitled *Men of Our Time;* but in the whole list there are hardly half a dozen names familiar to the general public, and of these some, like the Rothschilds and the Montefiores, are celebrated chiefly for their wealth and the use they have made of it. The volume bears testimony rather to the energy and intellectual vigour diffused among the race at large than to the frequency of signal or brilliant examples of worldly or intellectual success; though among those whose eminence is not the less real because their fame is limited by the nature of their pursuits we must recognize such names as those of Deutsch and Weil.

Professor Hosmer's *Short History of German Literature* (4) is, we think, well suited to what appears to be its purpose as a textbook for advanced schools. The author takes a few signal examples among the most eminent names of modern Germany, and dwells at length on the literary character of Lessing, Schiller, Goethe, and others; while in the former part of the volume he describes with equal fulness certain cycles or classes, as the Niebelungen Lied and other ballad poetry of the same type, the Minnesingers, and so forth, endeavouring to familiarize his readers with a few principal types rather than with a multitude of uninteresting names and tedious details.

Two volumes on our list possess importance and interest of a kind which does not render them suitable for detailed examination here. The Essays read before the Ministers' Institute of Providence, Rhode Island (5), deal with a variety of questions of biblical exegesis from the point of view of the most advanced Unitarians, some of them going far beyond the views even of advanced Unitarianism; one or two holding on rather, it would seem, in words than in thought, to the fundamental principles of all religion. The nature of Mr. Heilprin's elaborate volumes on the Historical Poetry of the Old Testament (6) is pretty fairly explained by its title-page.

Mr. Bryant's translation of the second part of Hegel's *Æsthetik* (7) falls under our notice in right of a very elaborate introduction by the translator, occupying nearly one-fourth of the whole volume, in which he endeavours to set forth his own view of the Hegelian system, the theory of symbolism, and its development in classical and oriental art and religion.

The Report of the Smithsonian Institution for 1878 (8) possesses, as usual, a certain special interest as a record of the progress made by the Institution itself, and also the general interest always attaching to the collection of papers appended to these reports. Of these the principal in the present case are biographical sketches of Condorcet and Agassiz; an elaborate vindication of Mr. Henry's claims in connexion with the invention and development of the telegraph; a very careful, minute, and we suppose very valuable account of the effect of irritation upon a polarized nerve; and a record of researches in sound, chiefly with relation to the effect of fogs on atmospheric vibration.

Professor Aughey's *Sketches of the Physical Geography of Nebraska* (9) are somewhat too minute and technical for the general reader. Parts, however, of the papers here collected have a bearing on general questions of geology which will no doubt be recognized by all students of that science.

Mr. Bell's little handbook on the faults of speech (10) relates, not to American dialectical peculiarities, but to organic or other difficulties of articulation, to physical or professional habits that impair clearness of pronunciation, and to similar class or personal peculiarities. To all whose speech is not readily and distinctly audible to others it may well prove practically useful, from the systematic method in which it deals with such faults and points out their cause and cure.

Messrs. Osgood have put forth a Vote Map (11) more elaborate in execution than those published by several English newspapers after the late general election, but resembling them in character, indicating the relative strength of parties in each of the Congressional districts throughout the Union. Even a cursory examination of this map enables the English reader to understand why the efforts of parties at a time like the present are concentrated so exclusively on a few States, the Democratic or Republican majorities in others being so obviously overwhelming that no change can be reasonably expected from the utmost efforts of oratory or organization. It is worthy of note also that in America as here the system of local distribution does not always tend to a real representation of public opinion. It might be quite possible that even in the House of Representatives, which is supposed to give effect to the popular as distinct from the State feeling, a great majority of Democratic electors throughout the Union should return a considerable

(4) *A Short History of German Literature.* By Professor James K. Hosmer. Second Edition. St. Louis: Jones & Co. London: Trübner & Co. 1879.

(5) *Institute Essays.* Read before the "Ministers' Institute," Providence, R. I., Oct. 1879. With Introduction by Rev. Henry W. Bellows, D.D. Boston: G. H. Ellis. London: Trübner & Co. 1880.

(6) *The Historical Poetry of the Ancient Hebrews.* Translated and critically examined by Michael Heilprin. Vol. II. New York: Appleton & Co. London: Trübner & Co. 1880.

(7) *The Philosophy of Art; being the Second Part of Hegel's Æsthetik.* Translated, and with an Introductory Essay giving outline of the entire "Æsthetik." By Wm. M. Bryant. New York: Appleton & Co. London: Trübner & Co.

(8) *Annual Report of the Board of Regents of the Smithsonian Institution for the year* 1878. Washington: Government Printing Office. London: Trübner & Co. 1879.

(9) *Sketches of the Physical Geography and Geology of Nebraska.* By S Aughey, Ph.D., LL.D. Omaha: "Daily Republican" Book and Job Office. London: Trübner & Co. 1880.

(10) *The Faults of Speech: a Self-Corrector and Teachers' Manual.* By A. M. Bell, F.E.I.S., &c. Salem: J. P. Burbank. London: Trübner & Co. 1880.

(11) *Congressional District Vote Map.* Boston: Osgood & Co. London: Trübner & Co.

majority of Republican legislators, or *vice versâ*. The districts being about equal, 25,000 Democrats in a district where there are but 5,000 Republicans may be nullified by 16,000 Republicans in another where there are 15,000 Democrats, 40,000 electors being thus counterbalanced by 21,000.

Who is Your Wife? (12) is the title of a short, sharp, clever, but we hope very widely exaggerated, satire on the marriage and divorce laws of the different States; showing, or caricaturing, the facilities existing for divorce at will, and the possibility that a man may be legally married in different States to different women, may be a bachelor in one and a bigamist in another. *Mr. Bodley Abroad* (13) is a clever illustrated series of real and imaginary adventures in America and Europe. *The Stillwater Tragedy* (14) is a sensational romance on American lines; *From Madge to Margaret* (15), a domestic story; and *The Verdendorps* (16), a sketch of some of the wilder possibilities of American life, mingled with the impossibilities of which the author's imagination is fertile. Mr. E. D. Root's *Sakya Buddha* (17) might be taken for an intentional caricature of the absurdities into which the unbridled licence of American heresy has strayed. It appears, however, that we owe its extravagances, literary and doctrinal, not to the author's humour, but to his absolute lack thereof. A single half stanza may afford a fair specimen of his style and the originality of his thought:—

> Great Heaven! the good All-Father
> Will ne'er the heathen damn;
> Believe had I much rather
> All priest-wrought creeds are sham.

Among American periodicals we may notice the *Wide Awake* (18), an illustrated magazine for young people, such as may serve well enough to keep children quiet and content for more than one stray half-hour.

(12) *Who is Your Wife? a Complex Conundrum Colloquially Considered.* By W. H. Phillips, LL.B., Author of "The World to Blame," &c. New York: Hale & Son. 1880.

(13) *Mr. Bodley Abroad.* By the Author of "The Bodleys Afoot," &c. Illustrated. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1881.

(14) *The Stillwater Tragedy.* By T. B. Aldrich, Author of "The Queen of Sheba," &c. Boston: Houghton, Mifflin, & Co. London: Trübner & Co. 1880.

(15) *From Madge to Margaret.* By Carroll Winchester. Boston: Lee & Shepard. London: Trübner & Co. 1880.

THE PRESIDENTIAL ELECTION.

THERE has been for some time little doubt of the result of the Presidential election, but the successes of the Republicans have exceeded their most sanguine expectations. They have carried all the Northern States, and they have obtained the control of both Houses of Congress. If the people of the United States care for the periodical excitement of a contest, it would seem as if they must invent a new party. It is true that at present all circumstances have been in favour of the party in power. The country has never before attained the same height of prosperity; no visible troubles impend at home or abroad; and Mr. HAYES says that the great body of citizens are as virtuous as they are fortunate. It is more certain that official and legislative morality has improved since the days of General GRANT. No Minister and no conspicuous politician has given occasion for scandal during the current Presidential term. Mr. HAYES and his advisers have carefully avoided collisions between the respective authorities of the Union and of the several States. With the growth of trade and population the financial condition has become more satisfactory by a large reduction of the interest of the debt, and by the rise of paper money to its nominal value. The SECRETARY of the TREASURY has not yet ventured on a genuine resumption of specie payments, for greenbacks still circulate with the privilege of legal tender; but no immediate inconvenience is likely to occur unless Congress insists on depreciating the currency by a substitution of silver for gold. The vicious legislation which Mr. SHERMAN has hitherto counteracted in practice was mainly promoted by the Democratic party in Congress. The attempts of some of their managers to coalesce with the Greenback or repudiating faction, for the purposes of the election, has probably been advantageous to the Republicans.

The Philadelphia Correspondent of the *Times*, himself an inveterate enemy of Free-trade, attributed, with much plausibility, the victory which he anticipated to the confidence reposed in the Republican party by the advocates of monopoly. General HANCOCK, indeed, had, in a published letter, denounced as absurd the principle of Free-trade, which he had evidently never taken the trouble to understand; but his excuse or disclaimer of sound doctrine was naturally interpreted as an admission of heretical tendencies. General HANCOCK deduced the necessity of a high tariff from the fact that a large revenue is required to pay the interest of the debt, and to meet the expenses of Government. The real Protectionists well knew that a larger revenue might be raised from lower duties, and they remembered that both the capital and the annual charge of the debt are steadily diminishing. A party seldom profits by an interested acceptance of the principles which are more consistently and more sincerely professed by opponents. The Republicans are unanimously hostile to Free-trade, and all hopes of their conversion must be abandoned during the life-time of the present generation. It is strange that a self-evident truth, affecting the interests of every community, should be rejected by all civilized countries with one accidental exception. If it had not happened that the English Protectionists were a small and aristocratic body, it is highly probable that the experiment of Free-trade would have been indefinitely postponed. Elsewhere, despotism and democracy seem equally adverse to the welfare of consumers and to the greatest prosperity of the greatest number.

Foreigners will regard the result of the election with indifference, though, through old association, the Republicans are perhaps more popular in England than the Democrats. The party which has now been long dominant was in former times opposed to the extension of slavery; and it still professes a special regard for the rights of the coloured population in the South. If General HANCOCK had been elected, his party would assuredly not have attempted to tamper with the Constitutional Amendment, and the future President and Congress will not voluntarily challenge collisions with the Governments of the Southern States; but, on the whole, the negroes and their friends at home and abroad will welcome the Republican triumph. The defeat of the disorderly classes which are to be found in some parts of the Union is not to be regretted. The rabble of the great towns, including the majority of Irish immigrants, have always been allied with the Democrats. The mob which lately dealt with the poor Chinese at Denver as if they had been Connaught landlords may be assumed to have consisted of zealous Democrats. The leaders of the party, and probably the majority of the whole body, are intelligent and respectable; but the lowest part of the populace inclines to the cause with which TWEED and KEARNEY have at different times been associated. General BUTLER, who was not many years ago the leader of the Republican party in the House of Representatives, has in the late contest supported the Democratic candidate. Some of his fellow-citizens, if they hesitated between the two parties, may probably have thought that they could not be in the wrong if they voted against General BUTLER. Another reason which has influenced many votes was the not unreasonable disposition to let well alone. The policy of the Republicans is known; and it was possible that newcomers might attempt innovation. It was certain that they would dismiss the actual holders of office, for the purpose of rewarding their own partisans. As no real political issue was raised by the contest, it may have seemed easier, and perhaps safer, to acquiesce in the existing state of things than to promote a change.

Republican partisans will exult more especially in their success in the doubtful States. The victory of the Republicans in the State elections of Maine and Indiana had not been decisive, for the result would have been different if the Greenback faction had concluded an alliance with the Democrats. The most remarkable change in the position of parties has been effected in New York. Some months ago the Republicans succeeded in electing the Governor of the State; but they admitted that their victory was only rendered possible by a schism in the ranks of their opponents. A demagogue named KELLY, who controls the Tammany organization, was determined to defeat the regular Democratic candidate on the pretext that he was a nominee of Mr. TILDEN. By detaching from the ranks of the party fifty or sixty thousand votes, KELLY secured the election of Mr. CORNELL. Before the Presidential election the feud had been temporarily or permanently abandoned, and KELLY exerted himself in the cause of HANCOCK. The Republicans scarcely thought it possible to carry the State, and they must now be astonished at their own success. It is of less importance that Connecticut, which was lately a Democratic State, has joined the winning

party. The Democrats have not been disappointed in their confidence in the unanimous support of the Southern States; but, to the general surprise, they find that the "solid "South" is encountered by a not less solid North. A quarter of a century ago thoughtful American statesmen apprehended serious danger from the possible division of parties into geographical sections; but at that time the North had not established its supremacy by arms, nor indeed had any party contemplated the enterprise of maintaining the integrity of the Union by force. It was assumed that the South could at its pleasure secede; and it seemed not improbable that the catastrophe might occur, if the Republicans succeeded in overthrowing the long-established preponderance of the Democrats. The justice of the apprehension which had been entertained was proved by the rupture which instantly followed the election of Mr. LINCOLN by a minority of the whole number of votes. The Civil War might have begun earlier if the votes of the States had at any time been distributed as at present. Two sections of the Union appear to be placed in open antagonism; but the risk of separation no longer exists. The resistance of the South to Northern supremacy has been once for all overcome; and, even if a renewal of the struggle was practicable, the Southern States have no longer any special institution to defend. The Republicans believe or assert that Southern unanimity is so far fictitious that the coloured population of South Carolina and two or three other States of the former Confederacy are only prevented by irregular means from returning Republican candidates. It had always been foreseen that white American citizens would at any cost prevent the coloured race from taking or keeping possession of the State Governments. In all probability the ex-Confederates will retain the control of the South. The discontent which many of them feel will not lead them into the desperate enterprise of another rebellion. If the incoming Republican Government is well advised, it will do its utmost to conciliate the South. On the other hand, the Southern States can scarcely fail to despair of obtaining any advantage for themselves by a continued alliance with the defeated Northern Democracy.

GARIBALDI AT MILAN.

IN a state of almost utter prostration from failing health, General GARIBALDI has again shown himself in one of the great cities of Italy. This time it is to Milan that he has come, and he has made what was only too obviously a painful effort in order that a ceremony held in honour of him and of his famous band might not be shorn of his presence. A monument has been erected at Milan to the memory of those who fell at Mentana; and it was almost impossible that anything short of death should keep GARIBALDI away when the defeat of Mentana was to be solemnly commemorated. The Italians retain in a singular degree the gift of sculpture which seems lost through so great a part of Europe; and the new monument is said to be a triumph of Italian skill. It is fortunate for the people of Italy that they have the exceptional pleasure of being able, when they set up a monument, to set up one at which no one can laugh. But, even if the work of art had been less successful, the subject of which the memory is now revived could scarcely fail to appeal vividly to their feelings. On one face of the pedestal there has been placed an inscription which states that the defeat of Mentana obscures many victories. It is not very easy to say what are the victories which are thus obscured. But it is safe to say that Mentana was one episode in the history of Italian success, and that, although it chanced to be disastrous, it was otherwise just like the other incidents of national triumph. Over and over again Italy forced the hand of France only to find that France liked to have her hand forced, or was ready to acquiesce in what was done after it was over. Mentana was merely an experiment of the kind which had succeeded so well in Tuscany and the Eastern provinces of the POPE. If there had not been a strong popular feeling in favour of running a great risk, and ascertaining, in the only practical way, what the Emperor of the FRENCH really meant when he said that Italy should not have Rome, the Italian Government would certainly not have raised a finger. But there was such a feeling, and it thought it as well that the experiment should be tried. In the last week of September 1867 the King issued a proclamation, saying that a private person like GARIBALDI could not be allowed to dictate its policy to the Italian kingdom, and GARIBALDI was arrested and sent to Caprera. Less than a month afterwards GARIBALDI left Caprera and was allowed to join his volunteers on the Roman frontier. On the same day the *Moniteur* published a notification that France did not intend to proceed with [illegible] intervention in favour of Rome, and, even w[illegible] decided to send troops, the French Governme[illegible] a Circular announcing that it would propose that [illegible]ongress should meet to settle the Roman question. This was the invariable resource of the EMPEROR in a moment of hesitation. Congresses were his trumps, and when in doubt he played them. As the EMPEROR was evidently hesitating, the Italian Government thought it would give him a lift towards making up his mind. When it learnt that French troops were coming to Civita Vecchia, the Italian Government declared that it too would send troops over the frontier. GARIBALDI, who had already obtained a small victory over the Pontifical troops, informed his followers that he should no longer proceed on his own independent account. He had got the national troops to do the work which he had set himself to attempt, and he gracefully retired, as he had done before, in favour of VICTOR EMMANUEL.

But the EMPEROR had found that France looked with very great impatience on the high-handed proceedings of the Italians. There was the strong Catholic party to reckon with, and the EMPEROR had come to find more and more that he could not do without its support; and then in the year before Italy had leagued itself with Prussia, and Prussia was so much hated and dreaded in France that there was a great jealousy of those who had chosen to profit by her successes. Whatever doubts the EMPEROR may have at one time had, they were now at an end, and he thought that the course most convenient to himself and most considerate to the Italian Government would be to give GARIBALDI a sharp lesson. He and his volunteers were made the whipping boys of Italy. A body of French troops under DE FAILLY attacked GARIBALDI on November 4th at Mentana, used their newly-invented chassepots, and found they worked wonders, wounded GARIBALDI, and killed those of his followers whose memory is now being celebrated at Milan. GARIBALDI was arrested by the Italian Government, kept for a few days in prison, and then sent once more to Caprera. Towards the end of the month there was a great debate in the French Senate, in the course of which THIERS vehemently inveighed against the folly of raising up a united Italy at the gate of France, and M. ROUHER, on behalf of the Government, declared that not only Rome itself, but every inch of the Papal territory was under the permanent protection of France. What happened three years later is a matter of notoriety. The chassepots had failed to work wonders on greater fields, and Sedan had cleared the path of Italy to Rome. After a feeble show of resistance, just enough to make it certain that he was yielding to actual force, the Pope ordered his troops to give up fighting, and General CADORNA entered Rome. He had just as much business to enter Rome as GARIBALDI had to put himself in a position to be defeated at Mentana. Italy was just as much responsible for the one act as the other, and the only difference was that there were French chassepots at Mentana and there were none at Rome in 1870. All these things are but parts of history that is already becoming old, but it is necessary to go over them once more in order that the significance of the Milan celebration may be understood, and that justice may be done, not only to those who fell at Mentana, but to GARIBALDI himself. The defeat of Mentana was not a mere event in the career of a rash adventurer. It was a part of the general history of Italy. The King, the Government, and the country were trying to repeat an experiment which they had found so often to succeed that they thought it worth while to try it again. This time the experiment failed, and most happily and conveniently for Italy all that happened was that a great adventurer was hit in the leg, and other minor adventurers revealed in their death the secret of what the chassepot could do until it was opposed to the needle-gun of a real army.

No one would think of saying that GARIBALDI is a wise man. He is full of odd notions which must seem as foolish as anything can be in the eyes of sensible people. When he was left in solitude after Mentana, he could think of nothing better than issuing an announcement to his coun-

trymen that he should never be truly happy until he saw the great shop, as he was pleased to call it, of St. Peter's turned into an asylum for the indigent. He is one of those democrats who hate not some priests or some Emperors, but all priests and all Emperors. By way of a deputation to him on behalf of France there have come to Milan M. ROCHEFORT and M. BLANQUI. The chief editor of M. GAMBETTA's paper has also appeared to testify the gratitude of M. GAMBETTA for the aid rendered, or attempted to be rendered, by GARIBALDI in 1870. But the main representatives of the country which he went to assist on the ground that it was the showing a healthy hatred of priests and Emperors, are two of the most irreconcilable of French irreconcilables. Even on the monument itself an inscription states that it has been erected by the democracy of Italy. Respectability in Italy keeps clear of Milan and the memory of Mentana. It looks askance while GARIBALDI is going through what may be the last scene of his romantic career. It could scarcely do otherwise. GARIBALDI helped to make Italy, but the Italy he helped to make could not last a day if it did what he wishes it to do. Italy has no other choice but to treat him at once as a hero and a madman. A hero whose common sense is on a par with the common sense of M. ROCHEFORT and M. BLANQUI is dead for any useful purpose to the world of homely practical politics. But nothing can be more indisputable than that GARIBALDI helped to make Italy, and his two great contributions to the making of Italy were the Sicilian expedition and the defeat of Mentana. By the one he gave VICTOR EMMANUEL a kingdom, and by the other a vicarious sufferer, and although Mentana is almost forgotten now, and, if remembered, seems a small thing by the side of the Sicilian expedition, it happened to come at the precise moment when to have a vicarious sufferer was to the King of Italy almost as great a gain as to have Sicily itself.

EASTERN AFFAIRS.

LORD NORTHBROOK said with literal truth at Birmingham that since the end of the Session the Government has taken no step with reference to the Eastern question, except in promoting or joining the naval demonstration. It was not the duty of a Cabinet Minister prematurely to let a popular audience into the secret of negotiations which are perhaps not yet concluded. The charges of undue diplomatic reserve which have been made against the Government are perhaps as unfounded as the incessant accusations of the same kind which were directed by the present Ministers against their predecessors. Vicious political practice has among other demerits the bad effect of provoking retaliation in turn. The fault of modern statesmen is rather excessive deference to popular curiosity than undue reticence. In accordance with earlier and sounder tradition, Lord NORTHBROOK regards as non-existent everything which has not appeared in an official or material form. If he has by accident read the statements and remarks of foreign journalists, or the communications of English newspaper correspondents, no ostensible impression has been left on his mind. Whether Germany, Austria, and France approve the policy of the English Government is a question which Lord NORTHBROOK has apparently not considered so far as to be prepared to answer it in public. He only knows that the European fleet is still on the coast of the Adriatic; and although, as FIRST LORD of the ADMIRALTY, he may have been consulted or may have received contingent instructions, he properly regards Cabinet secrets as confidential and sacred. If Lord NORTHBROOK were not by nature and habit laudably cautious, he might take warning by the inopportune garrulity of a less experienced colleague. Mr. CHAMBERLAIN a few days ago could not resist the temptation to elicit a cheer by a thoughtless assertion that the Eastern policy of the Government was accurately foreshadowed in the speeches of the Liberal leaders when they occupied a position "of greater freedom and less responsibility." It is not surprising that Austrian statesmen, having no means of estimating Mr. CHAMBERLAIN's political importance, should resent the virtual repetition by a Cabinet Minister of the insulting language for which Mr. GLADSTONE was compelled to apologize. Lord NORTHBROOK more judiciously abstained from the use of phrases which could provoke a remonstrance in any quarter.

The long and vexatious delay in the surrender of Dulcigno is not likely to serve the interests of Turkey. If the controversy had been settled two months ago, the combined fleet would have separated with little probability that it would at any time reassemble. Probably Germany and Austria might have been so far conciliated by the good faith and good will of the Turkish Government as to have used their influence to prevent any immediate employment of force by the more zealous Powers. At that time France would almost certainly have withdrawn from the prosecution of a joint enterprise; and public feeling in England might perhaps have placed a check on the policy of the Government. It is doubtful whether M. GAMBETTA has since exerted his influence on behalf of Greece; but it is more than ever certain that he controls the fate of the present and future Ministries. The neutrality of Austria and Germany would not necessarily prevent four of the Great Powers from interfering actively in aid of Greece, if they thought fit to do so. It is true that they are under no obligation by treaty to compel the surrender of Epirus and Thessaly; but all the European Powers when they took part in the Berlin Conference were content to rely either on the admissions of the Turkish Government or on their own inherent right to control territorial arrangements. A war with Turkey for a political object might or might not be morally just or politically expedient; but, according to historical precedent, it would not so much violate as supersede international law. Whether English opinion would sanction a war of conquest voluntarily undertaken by the Government is a question to be answered by experience, if the case arises. Lord NORTHBROOK at least is not likely to consult beforehand the constituencies which he advises to content themselves with the knowledge of notorious transactions without troubling themselves with rumours, even when they are probably true. His answer to Lord SALISBURY was not less carefully adapted than his narration of facts to satisfy an audience devoted to the policy of the Government. Lord SALISBURY was accused of indifference to the execution of the Berlin Treaty because he had contended that England had no special interest in enforcing the clauses relating to Montenegro. Lord NORTHBROOK would certainly not maintain that the English Government was bound to enforce all the other provisions of the treaty. He was careful not to explain the course to be followed in dealing with Greece, which is not entitled to the benefit of any formal stipulation.

The Greeks, if they were troubled with nice conscientious scruples, might reassure themselves by devolving the responsibility of a probable war on the Powers which were represented at the Conference of Berlin. The award or decree which assigned Janina and Metzovo to Greece assumed the right of the kingdom to some territorial aggrandizement, and the competency of the Great Powers to determine the extent of the annexation. The abortive negotiations between Greece and Turkey involved a similar recognition; and, after all, the Greeks are thoroughly satisfied of their inherent right to take possession of any Turkish territory which they can conquer. At present the Government seems to have resolved on war, though its policy perhaps may not be fully understood. The PRIME MINISTER is said to have informed an English newspaper correspondent that the army has reached the number of 50,000 men, with as many more in reserve. He adds the statement that the Government has not the pecuniary means of calling out the entire national force, but that it hopes to raise money by loans and by contributions from wealthy Greek residents in Europe. A later statement, made by Mr. COUMOUNDOUROS in the Chamber, seems to indicate a purpose of delay. He laments that the recruits are still not fully armed, and that many of them are imperfectly instructed. Probably the Greek Government is waiting to learn the intentions of England, and perhaps of France. The ostentatious publicity of the armaments is probably not accidental. Much less provocation than the challenge which is openly addressed to Turkey would, according to reason and precedent, justify a declaration of war. No State is bound to wait till it is invaded when a probably hostile army is gathering on the other side of the frontier. The Greek Ministers may possibly hope to provoke an attack on the part of Turkey which would enable them to assume a defensive attitude. If a few Turkish regiments were to cross the frontier, or if a Greek port were blockaded, there would

be a better chance of obtaining assistance from some of the Great Powers. There can be little doubt that a rupture is expected and intended. No Government would have been justified in incurring an almost intolerable expenditure except for some serious purpose. A simple disarmament, involving a renunciation of claims to territorial aggrandizement, would not improbably produce a revolution. A defeat would be preferable, especially as Greece incurs no risk of permanent invasion or of conquest.

The KING and his Ministers are probably convinced that, even if they commence the struggle alone, the Great Powers, or some of them, will interfere, either as allies or mediators. In the present day it will not be thought necessary to wait, as in the old Greek war, until the weaker party is threatened with destruction. The Governments which are likely to be most active will not affect impartiality between the belligerents; and there will be other interests to consult. The population of the disputed territory has some right to be considered in the determination of its future destiny. There can be no doubt that Greek administration is, with all its shortcomings, preferable to Turkish rule; and wherever the Greek language is spoken annexation to the kingdom will be unanimously desired. Only a few foreigners feel a strong interest in the conflict between two semi-civilized races on the frontier of Montenegro and Albania; but the liberation of Greeks who are still subject to Turkish dominion is a desirable object, if it can be attained without injustice, and without counterbalancing mischief. The conflict has long been understood to be inevitable, though it might in other circumstances have been postponed. There has never been a time at which the Turkish Government would willingly have ceded a large territory to an unfriendly neighbour. The claim of Greece is neither more nor less just at present than at any time during the past fifty years; but the Government and people believe that the opportunity has come at last. They are so far well advised that they have now a better chance than at any former time of securing the inaction of some Powers and the more or less active aid of others; but they will probably be disappointed if they hope the English nation will allow its Government to engage in a sentimental war.

THE JUDICIAL APPOINTMENTS.

THE transfer of Mr. Justice LUSH to the Court of Appeal was anticipated by the general expectations of the Bar and of the public. No one could be more fit to sit in a Court of Appeal, and no one could have better earned a seat in such a Court if he wished for it. Mr. Justice LUSH had been for fifteen years on the Bench, he had presided over many important trials, he had laid down much sound law, and he had worked hard to justify his nomination as one of the revisers of the Criminal Code. If his transfer is to be regarded as a promotion, he has amply deserved it. In itself, a seat in the Court of Appeal is not in any very obvious way a better thing than the post of a Puisne Judge. The pay is almost the same, and the work of a Puisne Judge is much more lively and interesting. The tedium of hearing long arguments from counsel for six hours day after day is not slight, and it would seem much more amusing to have the varied occupations of an ordinary judge, to have the excitement of Nisi Prius, the revelations of election inquiries, and the bustling from one Court to another only to find that the other is not going to sit. Our judicial arrangements are now very much like a game of puss-in-the-corner. Our judges plunge about, scamper into any Court that seems open to them, and always leave one of their number out in the cold. Then there is another plunge, another scamper, and the judge in the cold gets into a corner and is happy and useful for a moment. There is a bustle about such a life which is not without its attractions to buoyant and energetic spirits. The Judge of Appeal has to leave his home less frequently, is made a Privy Councillor, and has a little —a very little—more money. On the other hand, his occupation is more monotonous, and he enters on a life strangely devoid of fun and excitement. His real gain is the intellectual pleasure of sitting in judgment on other judges. He has to set himself to decide whether those who are his equals or superiors are wrong or right. That he should be recognized as fit for such a task is the real promotion which he wins, and has to justify. Unless he can justify it, he knows that his incapacity will be detected, and denounced or overlooked according to his personal popularity. There is not the slightest reason for saying that the Court of Appeal overrules judgments for the mere pleasure of overruling them. But it often has to overrule judges, and the judges overruled may be so eminent that there would be serious discontent if the Court that overruled were not felt to be strong. The few days during which term has now lasted have supplied more than one striking illustration. The Common Law section of the Court of Appeal has been very short-handed. Lord Justice BAGGALLAY is away on Circuit, and the death of Lord Justice THESIGER has created a vacancy. Persons no less eminent than the LORD CHANCELLOR and Lord COLERIDGE came to supply the vacant places, and sitting with Lord Justice BRETT have made a very strong Court indeed. If suitors cannot hope to get good law from such a Court, they cannot hope to get it anywhere. This Court has had occasion to overrule a judgment of the LORD CHIEF JUSTICE and a judgment of the late CHIEF BARON. The cases were not, from a legal point of view, very important. The judgment of the LORD CHIEF JUSTICE was overruled in deference to a decision which the Judges of Appeal considered binding on them, but which two at least of their number plainly stated to be in their opinion wrong. The decision of the CHIEF BARON turned on a point of practice rather than of substantive law. But, still, there were two decisions of the heads of divisions, and, however right it may have been to overrule them, it was most desirable for the Bench and the public that the Court which overruled should be incontestably strong.

Mr. WATKIN WILLIAMS has been appointed to the seat on the Bench which Mr. Justice LUSH quits, and no one can have a word to say as to his appointment, except that it is perfectly natural and proper. There was no one as to whom the Bar felt more sure that he would be made a judge, and the elevation of Mr. WATKIN WILLIAMS to the Bench would have seemed equally inevitable whether he was in or out of Parliament. But he is in Parliament, and rendered a striking service to the Government and to his party by boldly contesting and triumphantly winning one of the seats that it was thought most difficult to wrest from the Conservatives. He was so proud of his triumph, and his constituents had so endeared themselves to him by the ardent support they had bestowed on him, that he seems to have felt some difficulty in terminating a connexion which gave him intense gratification. He first of all volunteered an engagement to them that he would not accept what he termed an ordinary seat on the Bench. There were, of course, temptations which he could not be expected to resist, but a Puisne judgeship was not one of them. But his constituents loved him too well to permit him to make any sacrifice for them. Even if it was only an ordinary seat on the Bench that was offered to him, and he did not see his way to getting anything else, they would part with him rather than let him throw away even a humble prize for their sakes. They understood that he longed to say "yes" when he stoutly said "no," and with considerate kindness they gave him the help he wanted, and pushed their coy member into a judgeship. Constituents could not have behaved more handsomely, and Mr. WATKIN WILLIAMS has repaid their considerate appreciation of the inner workings of his mind with a farewell of rapturous gratitude. He happens to be a Liberal and a member of Parliament, but his appointment can hardly be called a political one. His professional eminence was such that he was only just not made Solicitor-General; and, as his appointment as Solicitor-General would have been perfectly justifiable, he had a clear title to the offer of a judgeship. A political appointment, if it has any meaning, must mean the appointment of a man who, if he had not rendered political services, or did not command political interest, could not fairly expect what, in deference to such services or interest, is given him. Such appointments have no doubt been made from time to time, and Lord CAIRNS, of all people in the world, has been praised for not making them. Lord CAIRNS must be delighted to find that the memory of men is so short that it only goes back to the time when he found himself really free, and could make his selections out of pure consideration for the interests of the public. With the present Government the difficulty of deciding how far the claims of political support should outweigh the claims of professional eminence is not likely to arise for some time. There is a whole host of lawyers

who happen to be Liberals, and who happen to be in Parliament, but who are incontestably in the front rank of their profession, and any one of whom might take an ordinary seat on the Bench as easily and properly as he might take a Hansom-cab. It may even be doubted whether a seat in Parliament is in such circumstances any great help to the Bench. The Government may think more of a seat that must be contested and may be lost than of such services as a Liberal lawyer has been able to render by assiduously going into the right lobby. Carnarvonshire is probably safe, but it would be difficult to be equally confident about, for example, Southampton. Leading lawyers in the present day go into Parliament quite as much because they do not want to be made Judges as because they do. They make an income which is double, or perhaps nearly treble, the salary of a judge; they want to save while the power of saving still remains, and they only go into Parliament because they love to work themselves to death, and because they feel that they would not do perfect justice to themselves unless they added some sort of political distinction to the legal distinction which they unquestionably possess.

The last act of the new LORD JUSTICE as a Puisne Judge has been to pronounce judgment in the Worcester election petition. He even found himself confronted with an objection on the part of the petitioners which they would never have raised had they not felt sure they were going to lose. They intimated to Mr. Justice LUSH that they did not consider him an election judge at all. They got so far in whimsical Latinity as to pronounce him to be *defuncto officio*. Other election judges had been appointed for the year, and so, although he had heard the case, he ought not to give judgment. He swept away the airy cobweb with a firm brush, and he and Mr. Justice MANISTY proceeded to give their decision. This decision is worth noticing as bearing on the question whether it is wise to hand over election trials to two judges at an enormous inconvenience to ordinary suitors. The inconvenience was never felt more strongly than it is now. It is not merely that there are not judges enough to do the work that ought to be done, but that there are not judges enough to do half the work. Some judges are on circuit, others are trying election petitions. The LORD CHIEF JUSTICE has been indisposed. Baron HUDDLESTONE has gone abroad for his health. The casual appearance of a judge at Westminster is greeted as a curious and pleasant chance, like the unexpected arrival of an old friend at Chamouni or Pontresina. Therefore, if on any special occasion we seem to be getting distinct good out of telling off two judges to go to Worcester and hear what could be said about fifty-three alleged cases of bribery and fifteen cases of treating, such an occurrence deserves notice. As it happened, the judgment which had to be pronounced at Worcester was one which could not have been pronounced with equal effect by any one but judges, nor perhaps could one judge sitting alone have given it due weight. The judgment consisted one-half of a reprimand and one-half of a nice adjudication on a point of mingled law and fact. The petitioners were severely and most justly censured for having got up a petition which they had scarcely anything to support, and for making the gravest charges on the foundation of the most idle and malignant gossip. Their counsel had to abandon three-fourths of their cases of bribery and treating as utterly worthless, and they had no evidence whatever to offer in support of the stinging charge of personal bribery which they had made against the sitting members, and in which they persisted until the last moment before coming into Court. Such petitions deserve to be reprobated not only on moral grounds, but as abuses of the machinery of justice. A different tribunal might have conveyed with equal effect a moral reproof, but judges alone could have protested with irresistible force against the abuse of a machinery over which, as the special representatives of justice, they were called to preside. The only point raised by the petition which called for serious consideration had reference to the closing of two polling-booths before the hour of the close of the poll had struck. The judges seem to have felt so much doubt as to this that they twice put off the time when their judgment was to be pronounced. After due deliberation they came to the conclusion that the polling-booths could not be said to have been technically closed before the appointed hour. Voting was interrupted, suspended, or delayed, but the returning officers never ceased to be willing and even anxious to do their duty. The legal meaning of the term closing was, under the circumstances, so difficult to determine, that it would have been unsatisfactory if the decision had been made by any but experienced and eminent lawyers.

MR. CAIRD AND THE INDIAN GOVERNMENT.

SIMULTANEOUSLY with the publication of the Report of the Indian Famine Commission, there has appeared a correspondence which is on several accounts well deserving of attention. Mr. JAMES CAIRD, one of the members of the Commission, has for many years taken a prominent part in investigations into the agricultural economics of this country, and it was naturally hoped that his long experience in matters of this nature would be of service in throwing light on analogous questions as they present themselves in India. He was accordingly invited, apart from his duties as a member of the Commission, to submit in a separate memorandum any results at which he had arrived and any advice which he was in a position to offer. In compliance with this permission he laid before the SECRETARY of STATE a summary of his general views of the country and a scheme of projected reforms. We have now the opinion of the Government of India on both. Such a document might well be expected to be instructive, nor does it disappoint our expectations.

Apart from its merits or demerits in other regards, there is one aspect in which Mr. CAIRD's letter is confessedly disappointing. It deals with a great variety of topics—with almost every topic, in fact, which comes within the range of administration, except the particular topic about which Mr. CAIRD had any special qualification to speak. When Lord SALISBURY observed that advantage to the cultivator might be anticipated from Mr. CAIRD's advice, he was no doubt thinking of scientific agriculture. Scientific agriculture, however, is the one subject about which Mr. CAIRD has literally nothing to say. There is not in his whole memorandum, from first to last, a single remark which implies the more accurate observation, the greater insight, of the scientific eye. Every one has known for years past that the yield of much land in India is extremely low—as low probably as centuries of reiterated cropping, without manure, can bring it; on the other hand, the Government has satisfied itself by careful experiments that Indian soil can, by proper treatment, be made to yield a crop as good as the best tilled land in Europe. The points on which information is sought are of a less simple character. In what manner can a restorative process be brought about over the 200 millions of acres now tilled by ignorant peasants, fast bound in the traditions and prejudices of a thousand years? What are the actual components and structure of the soil on which for centuries the same crops have been raised without perceptible deterioration? How far is it possible that intense solar heat, violent atmospheric changes, the sudden downpour of tropical rainfall, the raging sandstorms charged with electricity, may supply chemical ingredients essential to vegetable growth, but unknown in cooler regions? What are the causes of that mysterious saline efflorescence which in some districts follows irrigation, in others disappears before it? How far could deep ploughing supply, in the case of the highly absorptive black soil of the central peninsula, the place of irrigation? What possible sources of chemical manures exist which might work in Indian agriculture as mighty a revolution as has been within the last fifty years effected in Europe? On all these points much has been thought and written in India, and the opinion of a scientific agriculturist would be invaluable. On not one of them has Mr. CAIRD a word to tell us. He insists on the necessity of improved agriculture, as to which every one is agreed; but as to how to set about securing it he evidently knows as little—in fact, if he will forgive us for saying so, he seems to know a good deal less—than those whom he is professing to instruct.

It is not, however, of the negative demerits of Mr. CAIRD's letter that it is worth while to speak. If he had nothing new to say, his silence might easily be condoned. Unfortunately the modest *rôle* of silence was one for which Mr. CAIRD's temperament least inclined him. He was prepared not merely to criticize, advise, or suggest improvement, but to advocate changes tantamount to nothing short of a revolution, and to justify these revolutionary proposals by an indictment of the gravest kind against all the past and present administrators of the country. The outlines of his

views may be summarized—as far as possible in his own language—as follows:—India is a country the produce of which is barely sufficient to support the existing population, leaving a small margin for years of famine. "Scarcity, deepening into famine, is thus "becoming of "more frequent occurrence"; the people may be assumed to increase at the rate of one per cent. per annum, while the soil is undergoing gradual deterioration; "of this "there can be no stronger proof than that the land "revenue is in some quarters diminishing." "The pres-"sure on the means of subsistence is rendered more "severe by the moral disorganization produced by laws, "affecting property and debt, not adapted to the condition "of the people." The people are dissatisfied with our legal system. The British officials who see this are powerless to influence a central authority far removed from them, subject to no control of public opinion, and overburdened with details. The Government has drifted away from the patriarchal method of rule common in the East, under which the village community is left to its natural rulers, the village headmen. These headmen have been discredited; while, on the other hand, British officers are becoming year by year more strange to the people. Following out our English ideas, we have substituted the system of cash payment of revenue for payment in kind—"an ancient and "common principle in all countries," specially suited to small cultivators, carrying with it a natural check on over-population, and saving the people from harassing reassessments and dependence on the money-lender. The best proof of its success is that by its means the native Governments levy a revenue twice as large as ours without distress to their subjects. The principle is so sound and so suitable to the condition of the majority of the people that it ought to be tried in various parts of India. In the next place, we have conferred on the cultivator the right of property, and thus enabled him to mortgage his land. "If he "had no power to pawn his land, he could not obtain "too much credit from his bankers; instead of the "easy mode of borrowing, the cultivator would have "to rely on his own labour, the land would be more "honestly tilled, and would yield a more generous return. "Having parted with these two sheet-anchors—the native "village organization and the self-adjusting principle of "land tenure with produce rents, Indian statecraft has "fallen upon the quicksands of legal chicanery." English ideas and details of the law affecting property and debt have been substituted for those of the East, and a large proportion of the official staff is engaged in technicalities which merely harass and impoverish the people.

It is natural that diseases so grave should necessitate searching remedies; and Mr. CAIRD's proposed reforms certainly do not fall short in this respect. The first is to suppress the Viceroy and the Government of India, substituting for it a system of six independent provinces, each in direct communication with and supervised by the Secretary of State. Each of the provinces would have its own financial system, its own public works, its own Council and Legislature, subject only to the control of the Home Government. In the next place, the Civil Service should be abolished. "Among Europeans there should be no "longer a privileged service"; all but the purely legal officers should be recruited exclusively from the army. The removal of the best men from the army has, Mr. CAIRD admits, been objected to; but when the British army becomes the only means of entrance to the higher posts in the Civil Service, there would be a double inducement to enter it. Next, the very costly department of Public Works as a general office connected with the Viceregal Government should be closed, and each province carry on its public works as it pleases, native agency being more largely employed. Having thus set the Government to rights, Mr. CAIRD descends airily to the task of economic reform. The existing right of mortgage should, "whenever the opportunity arises," be withdrawn from the cultivators; at the same time they should be invited to redeem the Land-tax by paying double rates for thirty-five years, and thus become freeholders. These measures would, by promoting agricultural prosperity, strengthen the financial position of the country; but something might be done for its immediate restoration by a moderate and reasonable impost on special crops of value. Two rupees per acre on ten million acres of such crops would yield two millions sterling, an impost greatly to be preferred to the Income-tax; while a still vaster access of wealth might be realized by employing ten millions of acres in various crops, from which 10*l.* per acre might be earned "when converted into a manufactured "product by the well-employed industry of the people." The Egyptian system of forced labour, under which a fourth at least of the adult population is kept at public works, without wages and without food, might, "with "great public advantage and economy," be reverted to in India. When the programme is complete, "we might "with confidence expect that the present cloud of peril "and distrust would gradually give place to the steady "growth of prosperity and contentment."

The Government of India, not impervious to a joke has treated this strange medley with a grave politeness that sets its absurdity in the strongest possible light. It is not, it says, "inappropriate to remark that to perhaps "every question upon which Mr. CAIRD writes the atten-"tion of the Government of India and the local Govern-"ments has been for many years very carefully directed, "and that most exhaustive discussions and reports are to "be found regarding them in our offices." This is the keynote of the reply which has to be given to Mr. CAIRD and other like critics of Indian administration, who scamper through the country for a few weeks, stop every few thousand miles to ask a question or interview an official, and then, in the plenitude of ignorance and presumption, consider themselves entitled to criticize and subvert measures which are the result of a century of patient thought and practical experience. Every one of Mr. CAIRD's so-called suggestions bears on it the stamp of this rash and ignorant folly. The Government which he so glibly proposes to suppress was planned by the greatest statesmen of the day a century ago, and has been gradually elaborated into its present form by a long series of experiments, each teaching its own especial lesson. The "decentral-"ization" which he vaguely recommends has been already carried out, and a hundred difficulties, of which he has never dreamt, have been surmounted by patience and skill. "The costly central Department of Public Works," which he wants to sweep away, is an effective machine—too effective, as many people think—for criticizing and checking provincial expenditure. The village system, which he accuses the English Government of having destroyed, was almost extinct in Bengal before our arrival in the country, and has, wherever it was susceptible of revival, been fostered and developed by British rule into more active life. The payment of revenue in kind, which he considers as one of "the two sheet-anchors" from which the British Government has drifted, and recommends us to adopt, is a prolific source of oppression and degradation wherever it exists; its removal may be said to be the first step in all social progress, so that, instead of our imitating native States by adopting it, all the more enlightened native States have followed our example by adopting cash payments. The return to it would, by the universal consent of every Indian statesman, be the greatest calamity that could befal the country.

It is vain, however, to criticize any further a mere tissue of incorrect statement, hasty inference, and rash suggestion. Otherwise it might be worth while to point out that Mr. CAIRD entirely omits all reference to, and apparently is in ignorance of, the really great economic difficulty in India—the relation of landlord and tenant—a subject which for years past has occasioned anxiety, and which is now in more than one province receiving that patient and exact consideration which is the necessary condition of wise and reasonable reform. In like manner the withdrawal of the right of mortgage would be, practically, the cancelment of all the proprietary rights which a century of progress has brought into existence; so, too, the imposition of a special rate on valuable crops would reverse the policy which was deliberately adopted in 1837, and to which the extraordinary development of the country since that period is largely owing. We commend the letter of the Government of India to all those who wish really to know what account the responsible administrators of the country can give of their own and their predecessors' work, and what views and hopes of the future of India are entertained by men who speak with authority, because with ample knowledge and ripe experience. Of Mr. CAIRD nothing more need be said than that he has, at the expense of his own reputation for sagacity, afforded the Government an opportunity of contradicting a large number of erroneous assertions, and exposing a still larger number of absurd and impossible projects.

LORD SHERBROOKE ON IRELAND.

LORD SHERBROOKE'S latest contribution to the Irish controversy has not the value which it might have been expected to possess. The greater part of his short essay is devoted to a demonstration that Irish occupiers have no rights except those which they derive from contract. If they have made improvements without securing to themselves compensation for their outlay when they leave their farms, they have, according to Lord SHERBROOKE, only themselves to thank for their loss. He rightly objects to the claim of an equitable right, because in English technical phraseology equity is only a branch of law. It would be more convenient to speak of a moral claim to the enjoyment of any real improvement or of its value. The question has often been discussed, but it no longer possesses practical importance. It is not for any such right that the Land League contends on the platform, and that its accomplices commit murders and outrages. Lord SHERBROOKE was a party to the Land Act of 1870, which overrides nearly all his general propositions. The outgoing occupier has for ten years enjoyed the right to full compensation for his improvements, and if he is evicted he is also entitled to payment for disturbance. It is interesting to learn that Lord CLARENDON, who was intimately acquainted with the condition of Ireland, only assented with hesitation to the Land Bill which was proposed by his colleagues immediately before his death. Mr. LOWE was a more active supporter of the Bill, though he admitted that it established an exception to sound general principles. He made at least one speech in its favour in the House of Commons; and, if he is disappointed at the result of an anomalous experiment, it is strange that he should have forgotten the provisions and the main purpose of the Act. He now asserts that landlords and tenants are persons who have entered into contracts with each other, and that they are nothing more. In 1870 he must have satisfied himself that in Ireland they were something more or something different. Lord SHERBROOKE's general argument is sound, but it will altogether fail of its effect, because he has not recognized the special character of the existing difficulty. It would have been better if he had confined himself to the proposition that the enforcement of the law ought to take precedence of tentative redress of supposed grievances.

The same preference of general rules to practical necessities is exhibited in Lord SHERBROOKE'S objection to exceptional legislation. He thinks that the suspension of the Habeas Corpus Act and similar measures are the worst remedies which can be devised. It is perfectly true that Coercion Acts "involve the confession "that the law under which we live is not sufficient, if "patiently and firmly applied, to preserve the peace in "Ireland." There seems to be no sufficient reason for refusing to confess what is notoriously true. The English law would probably not be sufficient to preserve the peace in Khurdistan or in Zululand; and it entirely fails to preserve the peace in Ireland. "It is the remark of BLACK"STONE that, whatever disorders have arisen in England, "the common law of the land has sooner or later worn "them out." It is, or may be, the remark of any person who has attended to Irish affairs, that agrarian murder, outrage, and intimidation have sooner or later worn out the English common law. An inspector of police informs an Irish nobleman that the local assassins have resolved on his death, and the officer even knows the hired ruffian who has undertaken to execute the popular sentence; but the common law can only operate on evidence which in cases of this kind it is impossible to obtain. If the Habeas Corpus Act were suspended, the intended murderer and the principal conspirators might be locked up, and the life of an innocent victim would probably be saved. It would not be a heavy drawback to a course of common sense and ordinary justice that, according to Lord SHERBROOKE, "the common law loses its "weight and dignity when it becomes a *brutum fulmen* in "times of crisis and emergency." The evil is, that the thunderbolt is already innocuous, and not that its inefficiency is admitted.

There are perhaps few persons who differ from one another more widely in political opinion than Lord SHERBROOKE and Mr. CHAMBERLAIN; but they agree in preferring reliance on the ordinary law to measures which would prevent and repress crime as well as punish it. Mr. CHAMBERLAIN appears to doubt whether any offence has been committed; but he consoles himself with the reflection that, if the defendants in the Irish State prosecution are innocent, they will certainly be acquitted. Utterly disregarding Mr. FORSTER's repeated undertaking to apply to Parliament, if necessary, for exceptional powers, Mr. CHAMBERLAIN assures the Birmingham Radicals that the Government will in no contingency go beyond the ordinary law. To one of his partisans, who, as a former Chartist prisoner, objected to political prosecutions altogether, Mr. CHAMBERLAIN kindly explained that the proceedings of forty years ago were objectionable because the Government of the day applied undue pressure to the tribunals. The statement illustrates the falsehood of the Radical tradition which probably serves Mr. CHAMBERLAIN for history. Some of the Chartist prosecutions were instituted by Lord MELBOURNE and Lord JOHN RUSSELL, and the later cases occurred in the time of Sir ROBERT PEEL. Some or all of these Ministers must, if there were the slightest foundation for the calumny, have tampered with the integrity of Lord DENMAN, who was then Lord Chief Justice. Mr. CHAMBERLAIN of course professes a hope that Ireland will be pacified by changes in land-tenure, as Mr. GLADSTONE, in his letter to Sir GEORGE BOWYER, insinuates that the agitation is caused or aggravated by the rejection of the Disturbance Bill. Even the present Ministry will not venture to concede the demands of the Land League. The Disturbance Bill was recommended to Parliament as an exceptional and temporary measure for the relief of a distress which has now entirely ceased. Mr. PARNELL lately contrasted the circumstances of Ireland in two successive years. In 1879, he said, there was a failure of crops and the people were starving. In 1880 there was a good harvest for them to hold for the use of themselves, their wives and children. The landlords were to have no rents last year because the tenants could not afford to pay them. This year the property of the occupiers is too valuable to be handed over to others.

Mr. PARNELL, who understands his own business, constantly assures his followers that the Government will never originate measures which the Irish tenants ought to accept; but he adds that Parliament will sanction the legislation which the Land League may have already established and enforced. One concession which he announces as certain is described as the resumption by the State of the titles which it has given to land-jobbers through the Landed Estates Court. It had been thought that a Parliamentary title was indefeasible, though the State is inaccurately said to have given titles because the law sanctioned a certain kind of sales. Mr. PARNELL himself has perhaps never before attacked so audaciously the fundamental right of property. If a purchaser under an Act of Parliament expressly designed and passed to facilitate sales is liable to a resumption of his title on the demand of a seditious mob, it is difficult to understand how any owner can be safe. The Land League is consistent with itself in claiming the right to prohibit future sales. The man HEALY is reported to have warned intending purchasers that they were not, under well-known penalties, to bid for a certain piece of land which was advertised for sale. The League had determined that it should become the property of the occupying tenants at a price which would, in the absence of competition, certainly not be excessive. Mr. GLADSTONE can scarcely think that the violent interference of the Land League with private transactions would have been prevented by the Disturbance Bill. The tyranny of the conspirators is not limited to questions connected with land. One REDPATH, an American who ought long since to have been arrested, in a speech principally consisting of atrocious attacks on the memory of Lord MOUNTMORRES, announced, perhaps truly, that "MOUNTMORRES was "'hurt' because he had spoken disrespectfully of the "Fenians." He added that any one who spoke against the Fenians had better keep out of the West of Ireland. The so-called Radical Clubs in London lately passed an ironical resolution purporting to condemn agrarian outrages, whether they are committed by landlords or tenants. It would be interesting to learn whether they put Lord MOUNTMORRES and his brutal assailant on the same footing. The charge against the landlords of agrarian outrage is founded, like many other mischievous calumnies, on one of Mr. GLADSTONE's unscrupulous bursts of rhetoric. His random assertion that eviction was equivalent to a sentence

of death has been more often quoted as an incentive to violence, or as an apology for crime, than his equally reckless claim of a right to expropriate landlords, or his exposition of the advantages which resulted to Ireland from the Clerkenwell explosion.

THE FRENCH GOVERNMENT AND THE POPE.

THE French Government is going forth conquering and to conquer. Capuchins, Barnabites, and Marists fall before it at every step. To any one who looks at the conflict with the religious orders from the official point of view, the prospect must be exceedingly encouraging. These mighty communities, which threatened to overturn the Republic and reseat HENRY V. on the throne of his fathers, are toppling over in all directions. It needed only that the Republic should unveil its radiant countenance for its adversaries to become as weak as water. No resistance worth speaking of has been offered, because there was no one worth speaking of to offer it. Here and there doors have had to be broken open and barricades to be pulled down, but these obstacles have been evidences only of weakness. Behind them there has been nothing but a few old men or a group of angry women, with a handful or two of sympathizers in the street outside. The supposed strength of the religious orders has been proved to be a delusion. The Government has only had to show that it is in earnest in sending them about their business, and about their business they have gone.

So far as the facts are concerned this view of the case is perfectly accurate. If any persons imagined that the religious orders had that kind of hold upon the people which would make their expulsion either difficult or dangerous, they have undoubtedly been disappointed. It has been abundantly shown that no large section of Frenchmen cares about them in such a way as to provoke resistance now or reprisal hereafter. But it is this very revelation that makes the condemnation of the Government complete. The one thing that could have justified their policy would have been the discovery that it was one which needed all their strength and resolution to carry out. There is no question but that the religious orders, in common with the clergy generally, wished well to the monarchical reaction so long as they thought it possible that the monarchical reaction might come to something; and if communities not long since animated with this spirit had proved powerful enough to make their dissolution a process hardly distinguishable from civil war, it might have been argued that the Government was wise in not waiting to be again attacked. The religious orders would then have held a position somewhat resembling that which Prince BISMARCK has more than once attributed to France. They might have been simply waiting for their revenge, and, acting on Prince BISMARCK's supposed plan, the Republican Government might have thought it prudent to destroy them before they found an opportunity of obtaining it. As it is, the Republican Government has to justify itself in presence of a very different state of things. It has strained the law, and put Liberal principles behind its back, in order to dispose of an enemy who is plainly too feeble to be dangerous. In a time of profound political peace, with no danger in prospect, and no excuse for violence visible, it has chosen to break up one religious congregation after another, and to treat the simple act of association as though it was in itself a crime. A paramount necessity of self-defence is the only plea which could possibly be alleged in defence of such a policy as this, and where does any paramount necessity of self-defence present itself? Where is the danger against which it was so imperative on the Government to take precautions that they have felt themselves obliged to deal with an integral part of the ecclesiastical machinery of the country as Count MELIKOFF might deal with so many bands of Nihilists? Nothing that has happened in the process of executing the decrees has helped to answer these questions. There is no reason to suppose that the Republican Government will be in any way the stronger for what it has done. It has proved that it can win a magnificent victory over a feeble adversary; and that is all. When the sacrifices of principle and consistency which it has had to make in order to do this are taken into account, there is not much reason for congratulating it upon what has taken place.

The letter which the POPE has written to the Archbishop of PARIS puts the case of the religious orders against the French Government with very great moderation. These communities have for many years been busy in alleviating or remedying all the miseries which befall humanity. "They have been at work in hospitals, in asylums, in "ambulances, in time of peace and public security, and "amid the horrors of war and the tumult of combat." Misfortune, of whatever kind, has always been a sufficient passport to the hospitality of one or another community. The POPE then gives an account of the events which led to M. DE FREYCINET's resignation. Just when he was on the point of protesting against the dissolution of the Jesuits, it was represented to him that there was a chance of staying the execution of the decrees against the remaining orders if their members declared in writing that they stood aloof from political agitations. The POPE saw no reason why this declaration should not be made. "The "Catholic Church condemns no form of government." It holds that "the general good may prosper, whether "the management of public affairs is entrusted to the "power and justice of one man or several." In these matters the Holy See has but one object in view, "the "safeguard of Christian interests." It does not impugn the rights of sovereignty "by whomsoever exercised." It is remarkable that, even in the midst of the distress and annoyance which the execution of the decrees must have caused the POPE, he does not lose the opportunity of giving the Legitimists a rap on the knuckles. It would have been easy to minimize the significance of the declaration now that it has failed of its purpose, and to represent it as a mere statement of the commonplace that the Church accepts *de facto* Governments when it is not strong enough to overturn them. But the POPE does not care to avail himself of this loophole. He stands by the contents of the declaration, though the particular purpose it was designed to answer has not been fulfilled. He declares it to be a principle of public law among Catholics that forms of government are things indifferent, that the exercise of the rights of sovereignty by a Republic may be just as valid as their exercise by a Monarchy, and that the rule of many may be as conducive to the general good as the rule of one. Those who have condemned the declaration because it contained these principles have been blind to the interests of religion and society, and have forgotten that submission and obedience which it is the duty of good Catholics to yield to their bishops in affairs relating to the Catholic religion. It will be a somewhat difficult matter for the Ultramontane Legitimists to shift the weight of this censure from their shoulders. LEO XIII. speaks as ST. PAUL might have spoken, and as the Republic, whatever may be its sins, can hardly be a worse ruler than NERO, it cannot be urged that the POPE has not paid sufficient attention to the difference between the state of things now and the state of things then.

Probably the utterances of Popes, even when they relate to French affairs, do not find very many readers in France. But, so far as this letter does penetrate, it will certainly not put the conduct of the Republican Government in any more favourable light. The doctrine that Clericalism is the enemy cannot be preached with much assurance when the POPE, even after all the provocations connected with the suppression of the religious orders, refuses to condemn Republican institutions. For the complete acceptance of M. GAMBETTA's formula, the one thing needful is that the POPE should be got to curse the Republic. Instead of this, LEO XIII. persists in giving it his blessing. For the present it will probably make very little difference whether he blesses or curses, but in the end reasonable Frenchmen can hardly fail to ask themselves whether it is worth while for the Republic to quarrel with the Church, when the Church, in the person of its head, cannot be induced to quarrel with the Republic.

THE MUNICIPAL ELECTIONS.

THE exact political importance of the municipal elections which are annually held on the 1st of November is a matter which it is not very easy to calculate offhand. In not a few cases the constituencies, municipal and Parliamentary, are not entirely identical, and in a great many cases politics only enter partially, or do not enter at all, into the conditions of the contest. Even in Parliamentary elections proper, a very great deal of non-political matter enters into these conditions; but in municipal elections

the proportion of such matter is necessarily greater still. Nevertheless it is generally true that the signs of the struggle the results of which are tabulated more or less carefully year by year in the newspapers on All Souls' Day, are of value for the determination and reading of the political barometer. Almost the only solid reason put forward after the general election by the supporters of the Government to prove that their success was not a surprise to them was the result of the municipal elections in the preceding November. Few persons who are at all intimately acquainted with any English borough or boroughs can deny that there was on that occasion something like a demonstration against the then existing Government, and that in many cases this demonstration was the forerunner of the still more decided demonstration of April. Scarcely any attempt has been made this year to discern in the elections of Monday an endorsement of Mr. GLADSTONE'S "mandate"; and although it is true that no decided leaning the other way is to be observed in the total result of the changes now made in the Town Councils, these changes are yet, on the whole, favourable to the idea of a slight disenchantment on the part of the supporters of the Ministry.

The signs of this disenchantment are to be found rather in the character of the respective successes than in their total volume. There seems to have been, on the whole, a predominance of Liberals in the Town Councils; nor, if the actual numbers on each side are counted, does it appear that this majority has been much, if at all, diminished. We should have been rather surprised if it had been. A considerable time is necessary before such a wave as that which swept the country in the spring spends all its force, and a considerable season of dead water must even then be expected before the tide begins sensibly to flow the other way. No particular shoe pinches the taxpayer at this moment; no failure of the Government, numerous as its failures have been, has been of that obvious and glaring kind which convinces even careless observers; and, even had such a failure taken place, there has not been time to drive the fact of it into the head of the average constituent. But, just as the prevailing feeling, as judged from speeches public and private, seems to be one of somewhat inarticulate dissatisfaction, so this feeling, as judged from these elections, seems to come to something very much the same. The supporters of the Government appear to have been weaker in defence, its opponents somewhat bolder in attack. The chief Liberal victories are now either in places where there was already a very large Liberal majority, or else in places where parties were so evenly balanced that success might incline one way or the other without being very decisive. The Conservative triumphs were mostly either recoveries of what had been lost last year, or extensions of previous successes, or incursions into ground formerly held entirely by the enemy. Of course there are exceptions to both these rules, but still the rule is the rule, and the exception the exception. In some cases, indeed, the advantages obtained by the Opposition candidates are remarkable. The Conservative success at Maidstone in the late Parliamentary election has been more than confirmed in the municipal contest, where every seat fought has fallen to a Tory. At the neighbouring town of Rochester, the first Conservative returned for five-and-twenty years was seated after a definitely political contest. At Southampton, where an unexpected Liberal victory last November was followed by a still more unexpected Liberal victory in April, the tables have been turned by the seating of seven Conservatives out of ten. We do not observe any parallel instances on the other side in looking through the lists. At the same time, even a very cursory inspection of these lists shows the danger of trusting too implicitly to their apparent political indications. Northampton, for instance, has long had the credit of being one of the most Radical towns in England; and, if the present Parliament were arranged in chromatic scale, a deeper red could hardly be required for any member of it than for the present representatives of the capital of shoemaking. Yet there is a Conservative majority—if only a majority of one—in the Town Council of Northampton. It is of course possible that Messrs. LABOUCHERE and BRADLAUGH may have already produced a revulsion in the minds of their constituents; but, though we cannot say that such a consummation would greatly grieve us, we do not by any means assume that it is the case. Very likely the limits of the municipal and Parliamentary boroughs differ, or else the elections to the Town Council may have been conducted on non-political grounds. On the other hand, while it is sufficiently well known that Oxford is, bribery apart, a town very equally divided in matters political, the Town Council is and has long been in the hands of the Liberals. Such facts as these must act as cautions against a too hasty construing of the results of these elections. Yet, when every caution has been observed, we think it will be found that the balance of them has gone against the Government.

It is sometimes represented as a rather mischievous thing that politics should have anything to do with municipal elections. A person of pre-eminently practical mind might content himself with replying that, as it is unavoidable, or avoidable only on the by no means desirable condition of a total decline of the general interest in politics, the discussion of its mischievousness is idle. As a matter of fact, however, we do not think that in the majority of cases politics exercise a very prejudicial influence on municipal elections. No doubt when, as in one notorious case, not merely the electoral machinery of municipal contests, but every detail of municipal life, is mixed up with party politics, the result is bad enough. But in the great majority of cases nothing of this sort happens. The annual returns are full of the statement "that the "election was not fought on political grounds," and in most boroughs attention to the interests of the town will outweigh, in almost all it will counterbalance, the mere nomination of party leaders. Hence the whole result is a decidedly healthy one, because political partisans are constrained to be something more than political partisans, and to attend to the business and the welfare of the town. The advantages which they gain by so doing are not small. In all but the very smallest and the very largest boroughs the surest, and not on the whole the most expensive, though perhaps the slowest, and certainly not the least troublesome, road to a seat in Parliament is through the Town Council. This fact has become recognized of late years, and it has in not a few cases had the very beneficial result of sending into the municipality persons of higher station than the small tradesmen who at one time threatened to monopolize the position. The Ballot, by the encouragement it has given to the worst forms of corruption, has indeed somewhat neutralized this good effect by encouraging wealthy carpet-baggers to descend on constituencies. But even so—if the money can fortunately be made equal—the local man retains a portion of his advantages, and the ingenuous voter, bribed on both sides, is most likely to vote finally for the candidate he knows. Besides, by keeping up a definite political allegiance, the system of infusing a certain amount of attention to Imperial politics into municipal contests tends to prevent what is perhaps the greatest of modern political dangers. This is the aimless swaying backwards and forwards of the majority, according to no principle or even to any clearly understood idea, but under the impression that "the other follows may as well have a turn," that "if they are going to win we may as well be on the winning side," or some other equally precious reasoning. So long, therefore, as the American abuse (at present almost confined in England to Birmingham and a very few other towns) of making the patronage of the corporation the exclusive spoil of party is not introduced, there is little to be said against municipal politics. Nor, as has already been hinted, would it be of much use to say it even if there were much more to say. The political element is there, and it is extremely unlikely that it will be dislodged, though other elements may, and should, keep their places alongside of it. For these latter allowance must always be made; but the municipal elections will certainly hold, and perhaps strengthen, their position as political indicators, if only because of the prerogative influence (in the technical sense of the adjective) which they exercise. A success in them is undoubtedly a great encouragement to the party that wins it, and in some towns, where politics run high and the limits of the boroughs are identical, is decisive. The most important contest of last Monday was that at Liverpool, where every ward was fought and the recent Conservative successes were endorsed in the most emphatic manner. Mr. WHITLEY, indeed, is one of the most signal instances (with the PRESIDENT of the BOARD of TRADE on the other side) of the road which lies open through local politics to higher things. On the whole, the municipal elections this year, if they have not given an unmistakably certain sound, have justified their claim to attention by indicating what we believe to be the actual attitude of the

majority of the nation towards the Government. This attitude may be defined as one of somewhat irresolute disapprobation, capable perhaps of being soothed by some remarkable success, but pretty certain to be changed into one of decided hostility by any decisive failure, or even by the continuance of the existing situation.

CONSOLS AT PAR.

THE rise of Consols to par shows plainly what kind of results experts look to the Savings Banks Act to produce. It has often been objected to proposals to make investment in Government Stock easier that they imply a desire on the part of the holders of small savings which has no existence in fact. The Post Office, it has been said, already renders every service which such persons care for. It takes their money, pays them interest, and is always ready to return them their principal when asked. What more is wanted by the man who puts by a few pounds now and again? To offer him Consols would be to offer him an investment, whereas what he wants is a money-box—something that will keep the coin from burning in his pocket, or being filched from the old stocking, and return to him the next rainy day a little more than what he put it in. As the Savings Bank Act has not yet come into operation, it is too soon to say positively that this theory is unfounded. All that can as yet be laid down is that those who suppose themselves to be best informed on the question hold it to be unfounded. Buyers have gone into the Consols market in numbers sufficient to send the Stock up to par, because it is believed that the effect of the Act will be to increase the demand for Consols, and consequently to increase their price. Other causes might have had the same effect in a more gradual manner, but it is this particular anticipation that has had the effect at the present moment. Consols have been bought now because they are expected to be scarcer by and by, and they are expected to be scarcer by and by because the Savings Bank Act will considerably increase the number of buyers. There is to our minds little doubt that this expectation will be justified. As we have more than once pointed out, the State has hitherto discouraged thrift among the poor by calling its results by another name than that which they bear among the well-to-do. When the rich man has found his income in excess of his expenditure he has been able to invest the difference. When the poor man has made the same discovery he has only been able to put it by. It is true the results of the two processes have been identical. In either case the money has been deposited with the Government, and the Government has paid interest for the loan of it. But the sentiment of the two processes has been quite distinct. The trail of the Savings Bank has been over the one, while it has not been over the other. To many energetic young men among the working-classes the Savings Bank is not likely to prove attractive. It is to thrift what goody-goody books are to literature, and they are about as likely to carry their savings there on a Saturday night as they are to take out *Little Henry and his Bearer* from the parish library for their Sunday reading. There is an air of paternal government about the whole business which they heartily dislike, and to have to invest your savings by a process you heartily dislike is not an encouragement to make those savings larger. Investment in Consols is another matter altogether. It is what the ROTHSCHILDS themselves are not ashamed of doing, and to be a holder of Consols will prove, we believe, an object of ambition to a very different class from that which has hitherto been eager to have money in the Savings Bank.

The only fear is that the provisions of the present Act may be found to fall so far short of what is required to make investment in Consols popular, that the effect which would have been produced by a larger measure will not be produced even approximately. In the first place, the smallest sum that can be invested is 10*l*., and it will take a working-man some time to get 10*l*. together. He can, of course, take it in small sums to the Savings Bank, and transfer it into Consols when it has reached the right amount. But then, as we look at the Act, its principal merit is that it provides a mode of investing savings which is altogether distinct from the Savings Bank. If the road to Consols lies through the Savings Bank, this severance will not have been effected, and the advantages to be looked for from it may consequently not be realized. What is wanted is the power of investing a sum which is not more than a well-to-do workman may put by in the course of a few weeks, and for this purpose the present limit is at least as large again as it ought to be. The restrictions as to the amount that may be invested in a year and that may be held by any one investor, are not open to this particular objection; but they seem to be needless restrictions, and as such they are more or less vexatious. Why, for example, should a man who has put by 250*l*., and has 100*l*. left him, be forbidden to invest the whole of his legacy in the same way as he has invested his savings; or why, if he has invested 50*l*. by October, should he be compelled to wait till after the New Year before he can add the whole of his legacy to the stock he already possesses? These, it may be said, are exceptional cases; but, if they are exceptional, it seems hardly worth while to legislate against them when, by so doing, we set up an unnecessary difference between the purchase of Consols by a working-man and by anybody else. If, on the other hand, they are cases which are likely to occur often, that fact seems to show that the Savings Bank Act will not meet the needs which it was designed to meet. The removal of all limits upon the amount of Stock that may be bought in one year or held by one investor, is not open to the objection which was justly urged against a similar removal in the case of sums held by Post Office Savings Banks. The Post Office Savings Bank is an institution which holds out special advantages to the poor, and there are very good reasons why these advantages should not be extended unduly. It is a public advantage that the poor should learn to save money, and the State for its own interest sets up Post Office Savings Banks for the purpose of teaching them to save money. If it goes beyond this end, and aims at making saving easier for the middle classes, it enters upon a field which is already well filled, and simply sets up as one trader among many. In dealing with Consols the State is simply dealing with its own debt —the one article which modern States have to sell—and there is no reason why it should not deal with it in whatever way is best calculated to meet the wishes of its customers. If a customer has already bought 300*l*. of Consols, and is still anxious to go on buying them by 10*l*. or 5*l*. at a time, why should the State refuse any longer to sell them to him? It need know nothing of his position in life; it simply knows him as a customer, to whom it is convenient to make his purchases in a particular way. Why should it allow him to make them in this way up to a certain point, and then refuse to deal with him any longer?

We have dwelt rather upon the immediate occasion of the rise of Consols to par than upon the causes which have combined to bring them to a point at which a mere expectation of coming purchasers was sufficient to send them to par. The truth is that, in the absence of a great war in which England is directly engaged, Consols will continually tend to keep up to their present high level. As the country grows richer, there are less and less of them in the market. On the one hand, as the public debt is paid off, there is a smaller quantity of the Stock in existence. On the other, the amount of money which either has to be, or is preferably, invested in Consols, is constantly becoming larger. Where the quantity of an article is diminishing and the demand for it increasing, only one result can follow. The present rise, therefore, does not really supply material for any very novel speculations on the condition of England. It coincides with a generally high level of securities, but it does not seem to be very intimately connected with it. To a great number of people the rise in other securities will be of more importance than the rise in Consols. The present state of the Stock Markets bears very heavily on all who have to live on their investments and have not much to invest. The column in the *Investor's Manual* which gives the actual yield of Stocks at their present prices is probably scanned with melancholy interest by many needy widows and many kindly trustees. There is so little wherewith to buy Stock, and, so long as Stocks fetch what they do, there is so little income to be got from them when bought. The only consolation that can be given to investors of this kind is that the price of a security represents in some degree the estimate which experts have formed of its future prospects. If you have to pay dearly for it, it is probably because it is calculated that it will be paying a larger dividend next

year than it pays this. At all events, they who buy high-priced Stocks for the most part keep what they buy; and in the time of speculation which, according to appearances, is not far distant, this is a most important consideration to bear in mind. Consols at par are, after all, a better investment than shares in an Indian gold mine, which, if they can be bought on good terms to-day, may not be saleable on any terms twelve months hence.

FAIRIES.

It seems almost impious to bring the fairies under the microscope of mythological science. These beings, kindly or malicious, hideous or beautiful, have never endured to be closely examined. The Scotch fairies were fabled to be mere shells, fair if viewed from the front, but hollow and horrible if seen with a reverted eye. Their gold turned to withered leaves if handled too greedily, and Mélusine, with the jealousy of a true fairy, would not suffer her lovers to behold her charms unveiled. Yet Science, unwarned by the fate of the fabled Count of Lusignan, insists on examining even the fairies, and on discovering, if possible, the origin of the widespread belief in these half-human spectres. Perhaps there is not anything very definite to be discovered. The fairies are only the forms in which human caprice gives itself an outward shape; fairyland, with its enchanted palaces and faithful lovers, is but the home of dreams and unsatisfied desires. An inquiry into the origin of the belief in fairies will prove little except the truism that human nature is everywhere the same, and everywhere is apt to clothe its wistful visions of a life more free and lovely and powerful than its own in the shapes of fanciful beings born, like Circe's bower-maidens, "of the wells, and of the woods, and of the holy rivers, which fleet forward into the salt sea."

We shall return to the topic of our English fairy-lore, and try to show what a quaint compound it is of divers mythologies; but it may be well first to consider a theory of fairies lately propounded by an ingenious writer in the *St. James's Gazette*. According to this essayist, the fairies "are really historical beings or races, viewed through a later superstitious medium. . . . . The peculiarity of the fairies is that they are small, though very spiteful. Now it is certain that, before the Aryan invasion of Europe, the whole continent was inhabited by an aboriginal people, short of stature and dark in complexion, who built many of the existing megalithic monuments. . . . These people were identical in blood and tongue with the modern Basques: and they used weapons of polished stone alone." To shorten this explanation, it is averred that the Celts conquered or assimilated the Euskarian aborigines, but kept up, in popular tales, the memory of the little people whom they supplanted, and who have descended to our own time as fairies. The fairies that haunt old barrows of the dead are the ghosts of the departed Euskarians. It is the Euskarian fairies that make magic weapons, and stone arrow-heads, or "elf-shots." Originally hostile, the euphemisms which call them "good neighbours," "men of peace," and so on, have led to the belief that they are often kindly. Their modern names, *fée, fay, fade, fada*, and the rest, are derived from the Latin *fata*. The writer ends by saying that mythologists of Mr. Max Müller's school would miss the import of the fairies' small stature, underground life, personal characteristics, and connexion with stone implements, if they tried to explain the whole legend by aid of the Latin word *Fatum*.
